

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

INDEX TO VOL. III. PART I.

A.
 American Water Burner, referred to, 312
 Address to Subscribers, 1, 129
 Agriculture, 24, 40, 57, 72, 103, 120, 136, 151, 167, 182, 200, 216, 228, 245, 248, 263, 279, 310, 297, 327, 344, 359, 392, 406
 Architecture, of the skull, 56, 72, 119
 Almanac, for 1834, 80
 Apparatus for obtaining Fire, 84
 Animal Weather Glass, described, 149
 American Fisheries, 149
 Ants of Trinidad, account of, 166
 Astronomy, history of, continued, 182
 Archimedes, letter from, 197
 Asparagus, how to force it, 200
 Arches, ellipsoidal ones, on the means of computing, 364

D.
 Disbrow's Combined Steam Boiler, 24
 Dibble, improved one, described, 104
 Dip and Declination of the Needle, 162, 386
E.
 Engineers' Manual, announcement of, 145
 Ericsson's Caloric Engine, 147, 194
 Eggs, how to preserve them, 199
 Engraving on Wood, Mudie's plan, 358
F.
 Fairman's Rotary Steam Engine and Improved Boilers, 40
 Fence of a durable character, cheap one, 360
 Foreign Intelligence, 43, 73, 87, 109, 123, 139, 155, 172, 188, 222, 252, 284, 302, 318, 363
 Flower Pots for Tender Plants, 105, 220, 380

Lime, its great value, described, 49—its value as a manure, 201
 Langdon's Steamboat, referred to, 84
 Locks, percussion ones, in the army, 117
 Locomotive Engine, Baldwin's, 209—Stephenson's, for the Saratoga and Schenectady Railroad, 401—iron ones, 401
 Leg, bones of, proof of design in the construction of the human frame, 214
 Laws, list of, passed during the first session, 23d Congress U. S., 416

M.
 Mechanics in Canton, 325
 Malt and Tea, 213
 Migration of Fishes and Birds, 197
 Muscles, formation of, proof of design in the human frame, 247
 Naval Record, kept in the city of New-York, at Avoylle Ferry, 213, 261, 350
 Mines in America, report of Mr. Kemp, presented before the House of Lords in 1836
 Method of cutting hay and straw, 40
 Money, generally, described, 54
 Moral, improved ones, 297
 Moral, method of constructing, 70, 102
 Moral, respecting, coins made and issued
 Moral, white one, account of, 101
 Moral, mutually dependant, 165
 Moral, Wives, their excellence, 165
 Moral, popular errors respecting, 166
 Moral, r cutting straw, 183
 Moral, principles the Safeguard of Liberty, 405

This volume is supposed to have a map entitled

"Map of the Railroads and Canals
 Finished, Unfinished and in Contemplation in the United States.
 Drawn and Engraved for D. K. Minor,
 Editor of the Railroad Journal, By
 William Norris." The size is 36" by 23½".

York, respecting, 226
 Delaware and Hudson, 24
 Wabash and Erie, 193
 In New-York, 197
 For Sloops from Hudson River to the Lakes, 257
 Delaware and Raritan, 273, 404
 Tolls on, 277
 Chesapeake and Ohio, 370, 385
 Pennsylvania, 337
 Rice Lake to Lake Ontario, 322
 Wisconsin, 273
 Carriages, improved method of propelling, 81
 —answer of Gen. Humphry, 100—New-York and Pennsylvania, 180
 Comets, dissertation on, 164
 Churns, Dutch ones, described, 169
 Cattle in Great Britain, described, 185
 Chimneys, smoky ones, method of curing, 198
 Cows, instructions regarding milking of, 24
 Curd-Breaker, for skim-milk cheese, 41
 Currents of the Ocean, described, 215, 231, 260
 Cushman's Patent for wheels for railroad cars, 244
 Canal Boats, experiments made on the Clyde, 259—at Paisley, account of, 277
 Cheese, how to preserve it, 363
 Chinese Wall, described, 343
 Cushman on Arches, 354
 Cotton Scutching and Lapping Machine, by Snodgrass, 357
 Chubb's Patent Lock, described, 361

scribed, 150
 Hamilton's Sawing and Boring Machine, 330
 Home Intelligence, 8, 26, 61, 88, 126, 141, 157, 173, 187, 205, 221, 235, 253, 269, 287, 299, 315, 321, 348, 362, 396
 Hedges of Trees, recommended, 104
 Human Race, mortality of, 109
 Horsemanship, directions respecting, 165
 Harris' Steamboat, 195, 295, 296
 Hancock's Steam Carriage, described, 211
 Heat, now mode of generating, 211, 212
 Hussey's Grain Machine, described, 228, 360
 Horse Power, Beecher's plan, described, 279
 Heating Factories by Steam, Snodgrass' plan, 339
 Heart, circulation of blood through, proof of design in the construction of the animal frame, 342, 404
I.
 Illinois, prosperity of, described, 5
 Internal Improvements, 145, 193—in Michigan Territory, 225—in Canada, 321—in Virginia, 365
 Imitation of Gold, 149
 Inventors, their misfortunes, 404
 Iron, new method of casting, 245
J.
 Jackson Cotton Gin, described, 135
L.
 Letter from a Correspondent, 4

N.
 New day, domestic, 8, 26, 61, 88, 126, 173, 187, 205, 235, 253, 269, 287, 321, 348, 362, 396, 413—foreign, 43, 69, 123, 139, 155, 172, 188, 202, 221, 302, 318, 363, 380

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JANUARY 11, 1834.

TO THE PATRONS OF THE JOURNAL.—The second volume of this Journal has been completed, and with this number, (somewhat delayed, 'tis true,) another year is commenced.

In entering upon the duties of another year, it may not be amiss to ask those of its patrons and readers, who may have watched its brief career, have I fulfilled my promises? Has the Journal answered your expectations? Should you answer in the affirmative, as I, at least, may be permitted to hope, it will serve only to stimulate to renewed exertion to make the Journal more what I have desired, than I have yet been able to do. Should any of you, however, have cause to give a different answer, I can only say, that, under the circumstances, all that could be, has been done, to render it worthy of your continued patronage; and it now affords me much pleasure to assure you that I shall be able hereafter to render it far more valuable than heretofore. I shall not, however, now give any *new* assurances of my intentions, but merely repeat that, having decided to publish it *another* year, it will continue to pursue the path originally marked out for it. It will be mainly devoted to the subject of *Internal Improvement*, in its various modes. It will also have a mechanical, an agricultural, a miscellaneous, and a literary department—avoiding every thing like *partisan* politics, yet at the same time devoting a share of its pages to the recording of many of the important political measures of the day, for the convenience of those who desire to preserve them for future reference.

It has before been mentioned, yet it may be again, without impropriety, repeated, that thus far the Journal has not paid its expenses. I have, however, resolved to try it *another* year, and those who desire to have it, will run no risk by paying in advance for the volume, as I assure them that when once commenced, as it now is, it will be continued through the year, to those who *pay in advance*. Heretofore I have endeavored to *persuade* all to pay in advance, who wished the Journal sent to them; but have, in very many cases, been unsuccessful, either from the apprehension that it would not be continued, or from some other cause unknown to me; by which omissions I have not been able to make its income pay its expenses for *materials and labor*; and of course I have not only devoted my time to its supervision without compensation, but have also been obliged to advance, during the two years, over a *thousand* dollars to meet its ordinary expenses, that it might not be discontinued. Its discontinuance will not, therefore, I presume, be considered as a mark of disrespect by those who are *now* indebted for *past* volumes. It is always an unpleasant matter to part with old friends, especially if they happen to be *indebted* to us, and there is any prospect of obtaining the amount. It is, however, better that such friends should part while the debt is small, than that the acquaintance should be kept up entirely at the expense of *one* party—especially if it falls upon the one least able to sustain it. Those subscribers, therefore, who have not *yet* paid for the *previous* volumes, but wish to have it continued, will please to remember that prompt payment only for the *past* as well as for the *ensuing* volume will ensure its continuance. I am compelled to adopt this measure in order to reduce the expenses of the work, by printing only a number sufficient to supply those who *pay* for it, and to keep the sets, *now on hand*, complete. I regret exceedingly the necessity of such a course, but am resolved to work hereafter without compensation, for those only who are willing to aid in defraying the expense of materials and labor (except my own) necessary to its publication.

Bills will be forwarded in the next number

of the Journal to all who are now indebted for past volumes; and hereafter, each subscriber's name and residence, with the amount paid and date to which it pays, will be inserted in the Journal, that he may have evidence of payment in his possession, should his receipt be mislaid.

With a repetition, therefore, of the assurance that the Journal *will be continued at least another* year, and the expression of a hope that it will hereafter be a profitable work to all parties interested in it, as well as to the country at large, I beg to acknowledge the obligations under which the numerous favors of its friends have laid me, and to solicit a continuance, not only of their patronage as subscribers, but also as correspondents and friends.

* * In order to obviate the difficulty of remitting by mail, for want of *small bills*, I will observe that U. S. Bank notes of \$5, or over, may be remitted, when inclosed in presence of or by the Post-Master, at my risk, subject to postage, and credit for the amount will be given to the subscriber.

(D. K. MINOR.

New-York, January, 1834.

One word on account of the delay of this number. Absence and indisposition have been the principal cause. It will hereafter, as heretofore, be published on Saturday.

The Journal will, as heretofore, be published weekly, at *three dollars, in advance*. It will also be sent to those who desire it in *semi-monthly* form, with a cover, stitched, at \$4 per annum. Vols. I. and II. may now be had, *stitched in a cover, so as to be sent by mail*, like a magazine, or in boards at \$3, with price of binding, (25—50—or 75 cents,) per volume, as may be preferred.

In this number will be found "AN APPEAL TO THE PEOPLE OF THE STATE OF NEW-YORK," in favor of a Canal to connect the Erie Canal with the Allegany river. An effort is to be made, as we understand, to obtain an act of the Legislature, authorizing the construction of this important link in our works of internal improvement. It is a measure of great importance, and one which will, we trust, find no lack of friends in the right quarter. The documents accompanying the Appeal will be given in subsequent numbers.

Undulating Railroads. By A. CANFIELD. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

SIR.—Having heard several of our most distinguished civil engineers express a disbelief in the theory of the undulating railroad as laid down by the ingenious discoverer of its advantages, (though they admit that they had not carefully examined the matter,) I am induced to offer some remarks on the subject.

What I propose to shew is, that a car must and will run over an undulating road, with a moving power less than would be required to move it on a level road. Though, to my mind, this is abundantly proved by Mr. Badnall, I shall take a different course to arrive at the same conclusion.

Let us first suppose a car placed on a level road, and a locomotive power, applied which is just sufficient to overcome all friction. Now, the smallest additional force will put the car in motion; and the velocity will be exactly proportional to the said additional force. We will suppose it to be so small as to produce the least conceivable velocity. Now, we will suppose the same car to be placed at one of the apexes of an undulating road. We will suppose the undulations to be segments of circles. Now, if a power is applied barely sufficient to overcome all the friction, it is certain that the car will run down and ascend on the opposite portion of the circle to the same height as that from which it started; and the principle of this movement is in no respect different from that of a pendulum vibrating in the same circle. If we then suppose the undulation or segment of the circle to be the same as that described by a "second pendulum," it will follow as an inevitable conclusion, that the car must pass from one apex to the other in *one second of time*. Here then is a certain distance on the undulating road passed over in a certain limited time, whereas, on the horizontal road, with the same moving power, the time occupied may be as great as can be imagined. You will observe, (and it is important,) that this result is obtained, notwithstanding that the friction is supposed to be constantly the same on both roads, and, of course, the amount of friction greater on the undulating, (as it is longer,) than on the level road.

But the most important fact is the one stated by the inventor, viz. that the pressure from a car is less on an inclined than on a horizontal road. This is certainly true, since a part of the gravitating force or weight of the car must be exerted, or expended, in accelerating the motion in descending; and the same portion of the gravitating force must be sustained, or overcome, by the moving power in ascending and the amount of pressure from which the rails are thus relieved is the same, whether the moving power be an impulse or a constantly acting power. This leads to a very surprising conclusion, viz. that since the pressure upon the rails diminishes in proportion to their steepness, it follows that the steeper the undulations the less moving power will be required; and this must be the fact, until the pressure upon the road is so much reduced that the locomotive power will cause the wheels to slip on the rails. I here, of course, suppose that there shall be no loss of momentum in consequence of the change of direction of the moving body.

Another proposition that bears on the case is, that the pressure of the car on the rails is diminished in the same proportion as the velocity is increased, and from this cause the friction is lessened in the same proportion. To prove this in a few words, let us suppose such a velocity to be given to a car as will cause it to move parallel to the surface of the earth, without touching the rails; now, but a moment's thought is necessary to show, that if this velocity be diminished, the pressure on the rails will begin, and will increase in exact proportion to the diminution of velocity, and the friction arising from this pressure will increase in the same proportion.

If, then, it is proved that the friction or resistance to motion is less, it cannot be denied that the same moving power will produce a greater velocity on an undulating than on a level road; at the same time, I hold it to be proven by my first proposition, that if the friction were the same on both roads, that the undulating road still has a decided advantage.

I would not at this time go so far as to make an undulating road over a level route, nor do I suppose that very long or very steep planes can be used; yet I see

no reason to doubt that this will be found to be one of the most important improvements that have been made in railroads.

I am, Sir, respectfully, your obedient servant,
A. CANFIELD.

Paterson, (N. J.) Jan. 2, 1834.

On the Improved Art of Boring for Water, as practised in the United States: and as the Foundation of a Water Company in New-York. By JOHN L. SULLIVAN. [For the American Railroad Journal and Advocate of Internal Improvements.]

The practice of boring for water appears to have been first undertaken from the rational probability of its success; but it was found necessary very much to improve the instruments of the art, on account of the nature of the rock and soil. And, for economy of labor, to devise a mode of applying the power of the steam engine to a machine which raises the chisel and allows its blow by sudden release and fall.

The alluvial soil, in which the operation is often to be carried on more deep than wells could be made, required, to reach the rock, the invention of an iron tube, having the quality of great stiffness, without any considerable projection at the joints, both in order to be forced down by powerful leverage, and to be clear within, for the operations to be carried on through it. Being undermined at the same time that pressure is exerted, it, by successive lengths, reaches the rock to be bored into, *through it*—should there not, as often occurs, have been found abundance of water at the surface thereof. Implements to overcome any obstacle in the way have also been contrived.

The tube being entered a little into the rock, and pressed down, makes therewith a tight joint; and thus a perforation to the depth of seven hundred feet has in several instances been made. There are, indeed, accidents to which the operation is liable, but there are, also, implements to meet such exigencies; experience has now rendered their management easy. The bore is generally first two and a half inches diameter; and if more water is required than it affords, or permits, it is enlarged to seven inches, by an instrument called the *reamer*.

When the work commences in a rock above ground, it is usual to excavate a small well, as the water often rises to the surface, or nearly so; or the bore is enlarged for the reception of the pump.

To bring up large quantities from a small bore, hydraulic principles have been superadded; which induce a more lively flow of water to the boring, and up into the pumps. The former, by abstracting the column and making a vacancy much below the height to which the water ordinarily rises; the other by placing the pumps externally on the sides of the bore, lower than the height to which the water rises. Thus availing of the natural difference between the head and the position of the pumps; that, thus, filling quicker, they may be larger, and deliver more.

To be successful, this art seems only to require suitable instruments and requisite skill; and there have now been so many instances, that it begins to become a rational inquiry, whether there may not be in the geology of our country, good cause always to expect success. And, instead of looking to distant ponds and streams for a supply of pure water, whether there may not be a provision by Nature, even for cities densely peopled, on the very spot they occupy?

The researches of geology seem to have established the most material facts in this inquiry, that the primitive rocks are always stratified. It appears, that, while the earth was yet without form, and void of life, the crystallization which constitutes the rocks was going on, and forming them in strata; of which, the cause can be but conjecture. It is possible that the process extricated the substance that makes the division between them, till its quantity was sufficient to deposit; and, being settled, the crystallization recommenced, thus; forming successive layers. But that, besides the strata of its own kind, general layers of different kinds should have successively formed, is not less true than curious. In one mass, they might not have been so easily raised as appears was done.

Thus the primitive rocks are, it is believed, invariably found in the order of succession, upwards, of granite, granular limestone with quartz, gneiss, mica slate, soapstone, sienite, succeeded by the transition rocks, metalliferous limestone, argillaceous, and siliceous slate, graywacke slate, and rubblestone; which are again succeeded by the secondary rocks, red sandstone, breccia, compact limestone, gypsum, and rocksalt; and over these the diluvial masses, or aggregations of rocks and earth; and among them the recent alluvial deposits.

Thus the granite of the highest mountains must, in its formation, have been level and low; but, when the formation of the dry land took place, was upheaved by some physical cause, which the Creator had prepared.

On the Alps, in the vicinity of Mont Blanc, stupendous masses of granite stand up thousands of feet, as if protruded through strata of more recent formation, which slope down from them.

It appears that much the same operation, on the grandest scale, have prepared the continents for the habitations of man. The same fiat which caused dry land to appear, created the valleys, and the plains, the streamlets, and the rivers, and set bounds to the sea.

On the continent of North America, there are, obviously, three distinct systems of mountains. The central line of the Appalachian, being the Alleghany mountains, is granite. And the eastern border of the base of the system may be described as appearing at the falls of all the rivers nearest tide, discharging into the Atlantic south of the Hudson. In Darby's geographical view of the United States, page 81, it is said, "this inflected line, from New-York to the Mississippi, is marked, at distant intervals, by falls, or rapids, in the bed of the streams."

The Alleghany mountains, being two thousand four hundred and seventy-three feet high, attract and condense the vapors and clouds, and is well known to be a more rainy region than the plains below, giving rise to numerous rivers.

It is reasonable to think, that when the granite strata rose from their original position, that cavities were formed by their disruption, and that whatever spaces occur, must be filled with water, and be the passage for it thence among the strata to the ocean; and if so, this water may be intercepted, in part, by perforating the strata. This might have been reasonably expected, and this expectation has been verified by trials.

The nearest boring to the Alleghanies is at the Public Armory, near Harper's Ferry, on the Potomac. The next at Baltimore; again near the Schuylkill; again at Princeton; then at New Brunswick; Somerville; Amboy; Newark; and Jersey City.

On the island of New-York there were stronger reasons for expecting to find water in the rock than elsewhere, because here commences the third system of mountain formation, dividing the waters of the Hudson and Lake Champlain from those of the bays of New-England. It commences here and extends northward, forming the mountains of Berkshire and Vermont. It is a range of primitive rock, the strata of which rise from the west and probably decline towards the east from the centre of New-England.

We have the authority of Professor Eaton, a teacher of Geology, to say that the strata of primitive rock, after spreading down from the west as far as the Hudson, begins to rise, and come to the surface in the Berkshire mountains. That they do thus actually slope upwards from the west is known by the excavations made in this island.

The city thus being at the point where the range commences its rise northward, at the same time the strata dip west, the waters therein cannot flow east, and must, of course, flow south. And that the spaces are full of pure water is not only ascertained by its outpouring at the head of the streams of the Highlands in a thousand places, but by its actual abstraction here, in a number of instances, and by the spontaneous outpourings of it also here on the spot, in the very centre of the city.

The natural indications of water here were strong before any experiment was made. The rock springs of the 1st Ward were known before the Revolution; and the central valley, before it was occupied by streets, was the seat of large and deep collections of spring water; and one of these was, in 1798, deemed by the Common Council sufficient for the whole city; and it was a question whether it should not be preserved for this purpose. But it was filled up. Nevertheless, the springs which fed it are not lost. They continue to flow, and are, in fact, recovered by the effect of the deep tube above described. The two or three millions of gallons a day, which then flowed here, are regained and protected by a mass of earth from fifty to a hundred feet deep.

The proof of this fact is in the success of three tubes. Two of them in West Grand street, the other in Lawrence, near Canal, at Cram's distillery; and

this one continually overflows on being reduced one or two joints.

There is also proof of the like issues of pure water on the east side, north of Chatham square, by the success of all the tubes that have been set down to the surface of the rock near the East river.

But on the West side the water is not obtained without penetrating the rock about one hundred feet, being on the top of the slope thereof, but this operation has in every instance been successful.

The general reason for expecting success in this operation being thus explained, the inquiry becomes perhaps the more interesting, how often the theory has been confirmed by practice? The instances have not been many, but are rather convincing. The least likely to succeed was that of the botanic garden, because begun on the bare apex of an elevated rock, about the highest ground in the island. It penetrates the rock 112 feet, and the water stands 94 feet deep, constantly renewed.

The next proof is one mile more south, at the great well of the Fire Engine Reservoir, 113 feet deep, of which 96 are in the rock, and considerable water is obtained.

West of this, near the Hudson, are those about one hundred feet deep, which supply the city with rock water, by means of drays; also, that at a distillery on Perry street, which gives 22 to 26,000 gallons a day.

More southerly, and on the highest part of Broadway, near Bleeker street, is that belonging to the Manhattan Company, lately the subject of consideration by the Board of Commissioners.

It will be recollected that this Company was instituted to bring in the Bronx water, which, at the time their charter was granted, was estimated to cost about 200,000 dollars; but, by more complete surveys, it was found very likely to absorb their whole capital of two millions, so as to defeat the purpose of employing the surplus of 1,800,000 as banking capital. The Company had employed double the amount of the original estimate in supplying the city with the best water they could command, when the progress of the art of boring for water came to the knowledge of the directors.

After making a well 42 feet deep, down to the surface of the rock, they penetrated it 400 feet, in the course of which operation good water was found between all the lower strata, and not less than eight times.

They were so well satisfied with the result, as to have it reamed to the diameter of 7 inches: and, by applying only the power of a six horse engine, raise about 130,000 gallons of water a day. And the Board of Commissioners pronounce it good and wholesome; it is in fact so, and clear as crystal.

They also calculate that 42 such borings only would supply the city with six millions of gallons a day. This one cost ten thousand dollars.

The Company may possibly have expected to raise, at once, as much as would supply the pipes already laid down, by their agent, stated at nearly 700,000 gallons a day; if so, it was rather a too great demand on one boring, though this one is, in the improved mode of management, probably capable of producing considerably more than it as yet has done.

But from some other cause, probably the preference which the stockholders give to banking with their capital, their water-works are offered for sale to the city; and might well have been an object of purchase to any party competent to their perfection, as no doubt all the houses along an extensive range of pipes would take the water, were it all as good as that thus derived from the rock.

It has thus been shown why the general formation of the country is favorable to the system of deriving water from the rock, and why New-York, specially favored, has only to penetrate a little deeper than usual to find pure water in great abundance, at a moderate expense, and, when thus obtained, incomparably finer than that of the Schuylkill at Philadelphia, and free from all unfavorable influences of climate or locality. For, however dense the population of the city may be, the rock water is defended by the depth and nature of its channels.

An apology to your readers would be offered for the length of this article, but that the subject is now becoming an interesting one to most of our sea-port cities. At New Orleans a company is incorporated having a large capital, and a banking privilege. The Mississippi is perhaps the only river in our country that, like the Nile, comes at midsummer cool from distant mountains of ice.

But no stream can be other than a drain of the district it waters. And it is well known that impurities combine chemically with water.

The recent survey and report for an aqueduct route from the Croton, though at an expense very dispropor-

tionate to the present city, may be preferred by the community. But it is possible that the certainty and readiness, the inexhaustible nature of the sources which come hither in the natural aqueducts of the rock, have not yet been duly appreciated by the public. They certainly have not been by the commissioners; and it remains yet for public opinion to decide the interesting question, how the city of New-York shall be supplied with pure and wholesome water.

To leave behind so productive a source of supply as the rock affords, is like leaving a fortress in the rear.

This resource will, at all events, be the object of a company of capitalists. It has been solicited of the Common Council that leave be given to deliver it by aqueduct pipes. It is stated in the Water Committee's recent report, that the city actually pays 273,750 dollars for the water distributed by drays; and the shipping 50,000 dollars. They compute the number of buildings for which water would be required at 35,000. They state that in the city of London there are eight water companies. It is not stated why the Corporation did not supply that city. The explanation would have been that, where capital is to be applied, those do it most economically who have the most interest in making it effectual. One of them is stated to have risen greatly in value.

Appeal to the People of the State of New-York and their Representatives in the Legislature, in favor of constructing the Genesee and Allegany Canal

At a meeting of citizens in the city of New-York, favorable to the construction of a canal from Rochester, on the Erie Canal, to Olean, on the Allegany river, held at the Shakespeare Hotel, Oct. 11, 1833, Christian Bergh was called to the chair, and Edwin Williams appointed secretary. After full discussion, and a variety of interesting statements, it was unanimously resolved,

1. That in the opinion of this meeting, from the statements made, and information obtained from authentic sources, the proposed canal will have an important bearing on the growth and prosperity of this state, particularly of this city, and ought to be constructed at the expense of the state; inasmuch as it will open a new and great thoroughfare through the rich valleys of the Genesee, Allegany, and Ohio, to the Mississippi.

2. That a committee of forty-five gentlemen, from all the wards of this city, be appointed to call the attention of the citizens generally to the subject of this canal, and to take such measures to present this subject to the Legislature at the next session, as shall be expedient.

APPEAL, &c

In this appeal it is proposed to show, 1st, That the connection of the Allegany with the waters of New-York harbor is practicable by canals through Pennsylvania and New-Jersey: 2. That it is practicable by a canal from the Allegany within New-York to the Genesee river, and thence by the Erie canal and Hudson river: 3. That the expense of constructing the Genesee and Allegany canal will be covered by the increase of tolls on the Erie canal, and of taxable property within the western counties of the state: 4. That the Genesee and Allegany canal, as a public highway, is preferable, at the present time, to every other mode of connecting the great western rivers, the Ohio and Mississippi, with the waters of New-York harbor, and will lead eventually to the construction of a railroad through the southern counties of the state to the Hudson river: 5. That the construction of such a canal and railroad will secure to the city and state of New-York a large portion of the immense trade with the population on the banks of the Allegany, Ohio, Missouri, and Mississippi, which is now transacted at Philadelphia, Baltimore, Washington and Alexandria, on the Potomac, and in New-Orleans.

I. That the connection of the Allegany with the waters of New-York harbor is practicable by canals through Pennsylvania and Jersey.

In the year 1789, some distinguished citizens of Pennsylvania formed The Society for promoting the Improvement of Roads and Inland Navigation within that State. Their surveys and estimates and perseverance finally resulted in the construction of canals and railroads between Philadelphia and Pittsburg. The Grand Pennsylvania canal, commencing at Columbia, on the Susquehanna, at the termination of the Philadelphia and Columbia Railroad, forty miles from that city, extends westward 173 1/2 miles along the Juniata, till it meets the Allegany Portage Railroad, at Holidaysburg. This road runs 36 miles to Johnstown. Thence the western division of the Grand Pennsylvania canal runs westward 105 miles to the Monongahela river at Pittsburg. The Allegany Port-

age railroad crosses the Allegany mountains at the height of 1398 feet above the basin of the canal on the eastern side, and 1171 feet above that on the western side. The Schuylkill Canal and Navigation Company, incorporated in 1815, have completed their canals and locks along this river from Philadelphia to Reading on the Schuylkill, 61 miles. The Union Canal connecting the Susquehanna with the Schuylkill, was constructed so recently as 1827. It commences four miles below Reading, on the Schuylkill river, and extends to Middleton, on the Susquehanna, 82 miles. The whole amount of costs and estimates for completing these works and other auxiliary constructions is \$20,267,280, of which more than 16,000,000 have been already expended.

Another route from the Susquehanna to the Allegany was surveyed some years since, by the celebrated English engineer, Weston, and by him reported practicable within the experienced cost of other constructions deemed practicable; that is, by the Juniata, the Conemaugh and the Kiskeminitas, with a portage over the mountains of 18 miles. The Pennsylvanians, as it appears by published reports of their society above mentioned, have also extended their views up the Allegany and French Creek, with a design to obtain the trade of Lake Erie. They have also contemplated a connection between the Susquehanna and the Allegany, by a canal within the State of New-York, with a view to draw the trade of the west up the latter and down the former, and thence, by the Union canal, to the Schuylkill and Philadelphia! The great Delaware and Raritan canal, now on the point of completion, connects the waters of the Delaware with the waters of New-York, which, with the railroad now established between New-York and Philadelphia, will give fresh inducements to the Pennsylvanians to enrich their State by facilitating transportation across it from New-York to Pittsburg.

It is true there are great obstacles to be overcome between the Susquehanna and the Allegany, within the State of Pennsylvania; but without disparaging the enterprise of that State, it may be safely said that a New-York Legislature, realizing, as it has done, the immense benefits of canal construction within this State, were they legislating for Pennsylvania and sitting at Harrisburg, would surmount those obstacles, and form that connection with the least possible delay; and it should be known that measures are now taking in Philadelphia to achieve that object by connections between the nearest points of the Susquehanna and the Allegany within Pennsylvania.

II. The connection of the Allegany with the waters of New-York harbor is practicable by a canal from the Allegany, within New-York, to the Genesee river, and thence by the Erie canal and Hudson river.

In respect to this branch of the subject, reference is made to the reports of the canal commissioners, printed with the Journals of the Assembly for the year 1826, in the appendix (F.) They are printed at large in the appendix to this Appeal.

III. The expense of constructing the Genesee and Allegany canal will be covered by the increase of tolls on the Erie canal, and of taxable property within the western counties of the State.

The Genesee and Allegany canal may be estimated at an equal cost with any equal section of the Erie canal, say of 90 miles. Then the Erie canal is to be considered as extended by this branch into the western rivers and the States of Ohio, Indiana, Illinois, Pennsylvania, Virginia, and Kentucky, and Missouri, so that the whole extension of the Erie canal to Hamilton, on the Allegany, by this southwestern branch from Rochester, which is 270 miles from Albany, will be the same in length as from Rochester by the western branch to Buffalo, which may be considered also as extending into the State of Pennsylvania and Ohio, on the lakes. Treating the Allegany and Genesee canal as an extension of the great trunk of the Erie canal, is doubtless the correct view of this proposed construction; for it is now apparent, from the vast increase of trade and transportation on the western waters, and the practicability of steam navigation from Pittsburgh to Hamilton, on the Allegany, a condition of inland navigation not known nor contemplated at the first design of the Erie canal, that the projectors of this great work should have directed it towards the western rivers as well as towards the lake Erie. It is indeed too clear to every man's apprehension, that if the State of New-York, with a full knowledge of the existing state of western trade and navigability of the Allegany, were limited to the alternative of terminating its Erie canal in the lakes or in the western rivers, the latter most certainly must be preferred, as opening an extent of river shores through a populous and fertile country, exceeding, by many thousand miles and many millions of people, the extent of lake shores and number of lake population, directly connected with this canal, independent of foreign favor. But happily the

State of New-York may now construct both branches of the Erie canal, and enjoy the benefit of the trade from the rivers as well as the lakes.

These views are founded on the general principle governing the profit of canal structures, stated by Mr. Gallatin, in his report as Secretary of the Treasury to the Senate of the United States, in April, 1808. "Canals," he says, "with a few exceptions, cannot, in America, be undertaken with a view solely to the intercourse between the two extremes of the canal and along the intermediate ground which they occupy. It is necessary, in order to be productive, that the canal should open a communication with a natural extensive navigation which will flow through that new channel. It follows, therefore," says he, "when a canal has been constructed, and it might be connected by another canal to another navigation, the first constructed canal will remain comparatively unproductive until the other improvements be effected, until the other canal also be completed." Thus, if the Erie canal had terminated in its course westward at the Genesee, it would have remained comparatively unproductive till its extension southward to the western rivers, or westward to the western lakes. Had the southwestern branch of the Erie canal to the Allegheny been first constructed, the same reason for extending the westward branch to the lake would have pleaded with no less force, but not greater, than does this appeal to the people and the Legislature of New-York in favor of the south-westward branch from the Genesee to Allegheny.

The report of Mr. Gallatin, above referred to, was made in obedience to the order of the Senate of the 2d March, 1807, which embraced the whole subject of canals connecting the Atlantic with the great western rivers. And it appears from the report that no mode of crossing the Allegheny mountains from the Atlantic to Pittsburgh, was deemed practicable by canals north of the Potomac. The connection of the Susquehanna with the Allegheny, by the modes above mentioned, was adverted to by Mr. Gallatin, but deemed inexpedient. He insists much on the great importance to the Union and to the Northern and Middle States, of effecting some convenient mode of turning the Allegheny mountains on the north, and connecting the great western rivers with their Atlantic harbors. But at that day the great project of the Erie canal had not been sufficiently developed to show that by these means the great barriers between Atlantic and western commerce might be turned on the north. In this view of the object of this appeal, it rises into a great national work which is to be consummated on the soil of New-York, by the construction of this canal, well worthy to be considered as the south-western branch of the Erie canal, and as much destined to add no less to the productiveness of the grand trunk of the Erie canal, than its present extension from the Genesee to Lake Erie has done, and is doing every year.

But the building timber upon the banks of the Allegheny, within this State, and along its banks in Pennsylvania, comprising five hundred miles of shores, exceeds in quantity the supply of New-York ship-building for the next ten years, and perishes annually or is consumed for fuel, through mere want of conveyance to the Atlantic. Builders, both in naval and civil architecture in the city of New-York, are paying annually large sums of money for supplies of timber and lumber from other States, at great prices, and for inferior qualities, while our own timber, of superior quality, perishes where it grows.

But the inhabitants of the western counties generally are interested in this construction. Their property will be largely increased in value by the increase of population and business incident to the establishment of another extremity to the Erie canal, which connects it with a "natural extensive navigation that will flow through that new channel."

On inspection of the census of 1820 and 1830 of the United States, and of our state census in 1825, an astonishing increase of population, wealth and advancement, will be perceived at the extremities of our great inland navigation, and at places of entrepot along its route. The increase in the 8th senatorial district at the western extremity, from 1825 to 1830, exceeds even that of the 1st senatorial district, including New-York and Suffolk, Queens, Kings, and Richmond counties. Referring to Williams' New-York Annual Register, a work of unquestioned accuracy, it will be seen that the increase in these two districts, from 1825 to 1830, was far greater than in any others. The increase of the 1st district being 48,723, the double of any other district except the 8th, and the increase of the 8th being 76,211, approximating to the double of that of the first.

It is remarkable that among the counties which comprise the 8th district, the increase during those 5 years

in Allegany, Cattaraugus, and Chataugue, is the greatest, and the number of paupers is less than in most other counties of the State—and that the aggregate increase of population in this State, 302,674, since the healthful and invigorating action of the Erie canal, exceeds the whole number of population in each of nine States in the Union, and nearly equals the population in each of five more. These facts demonstrate, beyond all question, that the establishment of another extremity to the Erie canal must advance the wealth of the counties in its vicinity on every side. The southern counties along the Pennsylvania line must share in this benefit, in common with the other southwestern counties, and all must enjoy a large increase in every kind of valuable and taxable property.

The cost of this new branch of the Erie canal, which can scarcely be sufficiently described by a name so limited as the Genesee and Allegheny canal, will be covered by the tolls. This is easily demonstrated. The cost of constructing the Erie canal from Genesee to Buffalo is covered by the tolls which this branch adds to the earnings of the rest of the canal; and not by the tolls collected for transportation on that part of the canal. In like manner the cost of this new branch will be covered by the tolls collected along the whole route of the whole canal, on merchandise which this branch will carry to and from the western rivers. If it be admitted that the cost of this branch will not exceed the cost of the Erie canal from the Genesee to Buffalo, and that the quantity of merchandise brought from the western rivers and conveyed to them will be no less than the quantity brought and conveyed by the branch from Genesee to Buffalo, the conclusion is irresistible, that the expense of the proposed canal will be as entirely covered as is the expense of the canal from Genesee to Buffalo. It has never been considered necessary that each section of the canal should produce tolls to the amount of 7 per cent. on its cost. It is enough if the whole receipts cover the interest on the whole cost. But in constructing another branch to a natural and extensive navigation, it is sufficient warrant for incurring the expense, if there be a reasonable presumption that it will bring and carry such an additional quantity of merchandise as will yield tolls throughout the whole extent of the canal to the amount of 7 per cent. on its own cost. Of this result no one can doubt from the extension of the Erie canal by this new branch towards that vast and increasing inland navigation. The rivers will yield and require as much transportation as the lakes, and the business on each will naturally augment both.

The amount of taxable property in the southwestern counties in buildings occupied as dwellings and stores, and in the increased value of their timber and farms and manufactories, will not and cannot be overlooked as an argument in favor of this construction.

IV. The Genesee and Allegheny canal, as a public highway, is preferable at the present time to every other mode of connecting the great western rivers with the waters of New-York harbor; and its construction will lead eventually to the establishment of a railroad through the southern counties of the State, to the Hudson river.

It is preferable, because that connection will be effected first by the state of New-York, by constructions wholly within its own limits. The great advantage of making the first connection by water between the Atlantic and the western rivers north of the Potomac, is manifest from the report of Mr. Gallatin, who observes that after the course of trade is once established upon any convenient route, it is scarcely possible to divert it into another channel. This fact he uses as an argument in favor of adopting at first the most convenient route. This mode of connection is preferable now, because it is the most convenient route for transporting supplies from the largest market of foreign goods, where of course the producer finds the best market for his productions of every kind. It is also preferable now, because it is wanted as a less expensive mode of transporting merchandise from New-York to the banks of the great western rivers of the Allegheny and Ohio, the Missouri and Mississippi, during the summer months, when the commerce of New Orleans is for the most part suspended. It is preferable to a railroad, because it may be sooner made and with far less expense. Yet it will lead to the construction of the railroad contemplated between the Allegheny and the Hudson, because, in the course of a few years, the transportation between the western waters and the Hudson will probably require both of these means of conveyance. The transportation through Utica, at the present time, equals in quantity, every twenty-four hours, the whole lading of two large ships in the Liverpool line of packets.

But it is preferable because the rate of tolls between the Hudson and the Allegheny can be regulated at

convenience by our own Legislature. It is enough if the aggregate receipts of all the canals cover the expense of all by yielding 5 per cent. on the whole.

V. The construction of such a canal and railroad will secure to the city and State of New-York a large portion of the immense trade with the population on the banks of the Allegheny, Ohio, Missouri, and upper Mississippi, which is now transacted at Philadelphia, Baltimore, Washington and Alexandria on the Potomac, and in New Orleans.

By far the largest portion of population on the western waters, lies on the banks of the Ohio and Allegheny, nearer to the Hudson than to New Orleans, and it will always be in the power of this State, by making the transportation cheaper between the Hudson and the Allegheny, to secure the trade from Cincinnati and the banks of the Ohio for the city and State of New-York, if ever a lower rate of transportation of foreign and domestic manufactures should be essential to this result. But as a large portion of these manufactures, which now ascend from New Orleans, have been, and must need be, imported into New York, and be sent coastwise to New Orleans, before they can reach the shores of the Missouri, the upper Mississippi, and the Ohio, the freight and insurance from New York to New Orleans, must be superadded to the river transportation upwards, and in this view it is clear that New York must secure to itself, by the construction of this canal and of the railroad from the Allegheny, a large portion of the trade which is now transacted in New Orleans, and by parity of reasoning, a large portion of that done through the Chesapeake and Ohio canal to the Potomac, and the grand Pennsylvania canal to the Schuylkill: for New York sends her importations to every city in the Union.

It is respectfully urged upon the people, and the members of the Legislature, that the present is the fitting time for action. The whole country is prosperous beyond all former conditions of welfare; engineers of experience are at hand; and practised laborers are numerous. The necessities of life are cheap, and wages low. A spirited effort might accomplish this great national work within a year from its commencement.

CHRISTIAN BERGH,
Chairman of the Committee.

[To be continued.]

The following are specimens of letters which are daily coming to hand, since the continuation of the Railroad Journal was announced. Most of those who have been familiar with it from its commencement, appear to view it alike as not only being worth its cost, but also, of some benefit to the cause to which it is mainly devoted, notwithstanding the very little attention which my other avocations have hitherto permitted me to devote to it. It has been thus far, or for two years past, my evening's amusement, or task. It will hereafter receive a share also of my daily attention, and it will therefore I trust be found to contain a greater variety of useful and interesting reading than I have yet been able to furnish. I have no hesitation to guarantee it, if all those who patronize the Journal by subscribing for it, will do so in a manner as substantial as the gentlemen who wrote the following letters. Such patronage can be relied upon; it enables an editor to borrow the ideas of others to enrich, rather than their money to pay the expenses of, his Journal; and it may well be said that he who is often obliged to resort to the latter, can hardly be expected, either to make judicious selections, or to communicate his own ideas relative to measures and modes of improvement in a proper manner. On this subject, the editor of this Journal speaks feelingly.

DEAR SIR: Although I am unable to procure any subscribers to your valuable Journal, I am not the less anxious for its prosperity and circulation through this country. I regret that scientific men, men whose circumstances in general enable them to reap great advantages from such a publication, should

have permitted you, by their neglect, even for a moment, to anticipate its discontinuance. Gratiified, however, that your prospects are sufficient to induce its continuance another year, I herewith enclose to you a five dollar bill, and my best wishes for better success hereafter. Truly yours, S—.

DEAR SIR,—When I saw some weeks ago your notice that the Railroad Journal was in danger of death from *atrophy*, I was truly astonished that the friends of internal improvements in this extensive country could be so few or so blind to their own interest as to suffer a paper so valuable to languish for a moment; and I am happy to perceive by the notice in the Journal of the 23d November, that they only wanted a little prompting, and that subscriptions have so far increased as to warrant the hope of its continuance.

I feel somewhat as if an apology was due from this quarter of the country, for the very meagre subscription list it affords the Journal. We are deluged with political papers, (more than are or ever will be paid for,) which, most of them, serve very little purpose but to exasperate the feelings of the community. Every one thinks he must take his party's paper, and very few think they can afford to take any other. I have endeavored, as far as I have had opportunity, to procure names for you, but do not know that with any success. Some have told me that they would send for the Journal, but whether they have or not I do not know. I did not sent their names because they did not advance the money.* We are yet years behind other parts of the country on the subject of public improvements; I think, however, that as soon as some "demonstrations" are made with regard to railroads which are now in embryo in this region, there will be a change of feeling and action, and I hope many copies of the Journal will be called for.

You intimate (Nov 23d) a possibility of changing the form of publication from weekly to semi-monthly, or monthly, and, among other reasons, you mention the greater certainty in transmission by mail. Newspapers from all parts, particularly political papers, have been occasionally missed, or materially damaged; but my journal has in no one instance failed. It has sometimes been delayed a week or so, and that is all. I impute this to your careful and strong wrapping, and very legible direction. I think nothing else would have saved it. A semi-monthly or monthly could not have been more certain, and, as far as I have known, not so regular. An objection may lie against the change, as the character of the paper may be considered as changed from newspaper to magazine or pamphlet, which, you know, involves an increase of postage. As another objection, I mention a remark made to me just now by a lad who had just taken up the Journal, as usual after his day's work, and was reading the introductory article: "we cannot wait so long." You see, therefore, there are some who would prefer it as often as possible. Perhaps, however, other considerations may preponderate on the other side, and we must submit to the majority vote. If the majority should be against me, you may depend on it I shall act on this subject like some of our trimming politicians and go over to the strongest party, and precisely for the same reason—love of the "spoils"; for I shall not be disposed to give up the Journal for a mere change of form, so long as I think I get more than the worth of the money by it.

This, by the way, brings to mind your threat (if I may call it so) of raising the price to four dollars. To this subscribers may, of course, be expected to object; but if we cannot support it by an increased number, why, then better pay an increased price than not at all. I would take the liberty, however, to suggest, that as most of the subscribers probably take the paper only, or chiefly, for the benefit they derive from the railroad department, or its collaterals, perhaps it would better reconcile them to an increase of price, (should you resolve on that measure,) if the proportion of matter in that department should at the same time be increased at the expense of some of the miscellaneous matter. But I would not undertake to judge, and would apologize for the liberty I have taken, were it not that I think it quite as safe to trust the whole to your candor.

Respectfully, your obedient servant, M. G.
Maine, Dec. 3, 1833.

* Mr. G. has since ordered the previous and ensuing volumes for a gentleman.

We understand that two locomotives for the use of our railroad, arrived in the ship *Saluda*, this morning, from New-York, and that another

is soon expected in the *Lady Rowena*, from Liverpool.—[Charleston Patriot.]

The Milton (N. C.) Spectator says: "The enterprize of connecting Raleigh with Petersburg, and Richmond with Fredericksburg, or in other words extending the Petersburg railroad to Raleigh, and constructing one from Richmond to Fredericksburg, will no doubt be crowned with success. The legislature of both states are willing to grant a charter, and when completed will form one of the grandest thoroughfares in the United States. Success attend it."

The same paper remarks that, "The tobacco crop, from all that can be gathered from most sources, is certainly short, compared even with the previous year. Some reckon it is short by one-third, and many by one-half; perhaps the former may be the most accurate. The prices consequently will be well supported, if short crops have such a tendency."—[Petersburg Intelligencer.]

[From the Louisville Public Advertiser.]

CUMBERLAND BAR.—The obstruction in the navigation of the Ohio, occasioned by this formidable bar, has been completely obviated. A dam, five eighths of a mile in length, fifty feet broad at its base, eight feet wide at the top, and rising four feet above low water, has been erected between Dog Island, near the Illinois shore, and the head of Cumberland River. This dam is so secured by abutments that it cannot be undermined by the action of the current; and, by it, all the water that flows down the River, at a low stage, is thrown between Cumberland Island and the Kentucky shore. No doubt is entertained of the permanency of this very extensive dam, by which the bars at the head and foot of the Island have already been so far removed, as to give, at that place, as great a depth of water as there is over the ordinary bars of the river; and the action of the current is daily deepening the channel and sweeping away the remnants of the bars. The citizens of Smithland are delighted with the improvement, and it must prove highly acceptable and beneficial to those engaged in the navigation of the Ohio.

WHITE PINE.—This tree, which constitutes the uncoined bullion and much of the present wealth of this part of the country, is the loftiest tree in the United States. It attains sometimes the height of 150 feet, or even more, with a trunk five feet and upwards in diameter. Its foliage is evergreen, light, delicate, and making an elegant appearance. It is found most abundant between the forty-seventh and forty-third parallels of latitude, along the Alleghanies to their south-western termination, and in its greatest glory west of the Rocky Mountains, on the river Oregon. On the head waters of the Alleghany is cut all the pine destined to supply not only the towns along the Ohio, but also the New-Orleans market, 3000 miles distant. On the head waters of the Delaware are large forests of white pine, which are floated in spring down the waters of that river, and the west branch of the Susquehannah, for the supply of the cities and towns in that quarter. The shores of Lake Champlain, and the banks of the rivers flowing into it, abound in this kind of pine, which is partly floated down the St. Lawrence to Quebec, and partly through the northern canal to Albany, whence it is distributed down the Hudson. But Maine furnishes about three-fourths of all the white pine lumber exported from the United States, and the Penobscot river is the centre of this trade, and hereafter must furnish the main supply in the lumber market. Throughout the northern states, about three-fourths of all the houses are built chiefly of this material, and the ornamental work of nearly all the rest is composed of it. For masts and spars its use is almost universal throughout the middle and northern states; and owing to its lightness, its loss could not be supplied without considerable difficulty. The Riga masts are said to have more strength; but the English derive most of those in the merchant service, and yards and bowsprits for the navy, from New-Brunswick and Canada.

As the sources of supply are annually drying up, and the demand is constantly increasing, the pine timber lands of our state are becoming invaluable.—[Bangor Rep.]

PROSPERITY OF ILLINOIS.—The following letter, from the Vandalia Whig, affords an example for clergymen, and particularly missionaries, to make public information connected with the prosperity and happiness of the people.

We copy with pleasure the following interesting extract of a letter from the Rev. J. M. Peck to Gov. Reynolds. Mr. Peck has travelled over the State perhaps as much as any person in it. He has recently made the tour of the Northern Counties, and takes an interest in noting the progress of every valuable species of improvement; his comparison between the appearance of things there, in the present and former seasons, may doubtless be taken as founded on correct data. Mr. P. is a gentleman of high character, of intelligence, and close habits of observation. His letter may be safely trusted "beyond the Blue Ridge" by those who wish to hear from the "far West."

ROCK SPRING, Ill. Oct 12, 1833.

Gov. REYNOLDS:

Dear Sir,—It will be gratifying to you, as it is to me, to learn that our state is improving rapidly in population, industry, enterprise, wealth, character, and intelligence. The crops, generally, are more than ordinary. I judge that two acres of corn have been raised this season wherever one was before, and the amount of new ground broken, fences made, and buildings erected, is double to any former year.

Schools are increasing—and a better order. Sunday schools have gained about twenty-five per cent. The class of emigrants who come are generally of the first order—then of more wealth, intelligence, and enterprise.

Chicago is destined to outstrip every other town in the State. The average amount of buildings has been one a day. Seventy arrivals of schooners, and two steamboats, from April 18 to September 11. Population now about eight hundred. Thirty stores, and plenty of mechanics.

Ottawa does not thrive rapidly. Our canal commissioners ought to have fixed the town four miles up Fox River, at the Rapids. There is the great place for business, and will eventually become one of the greatest water power places in the great West.

The Railway from Chicago to the foot of the Rapids of Illinois, (not at Ottawa,) ought to be going forward, and I think should cross Fox River at the Rapids of Fox, and run from thence straight to Chicago.

Indeed, the project should now be entered upon of a Railway from Chicago to Alton. Make it first to the navigable waters of Illinois, say Little Vermillion.

If once made to that point, I have no doubt the business would more than pay the interest on the capital and ordinary expenses. Then commence at Alton and make one to Springfield. When this is completed, I would defy the world to prevent the two ends from being tied together. Twenty-five years will see this done.

Excuse my rude suggestions—doubtless the subjects have occupied your thoughts before.

I will only add, a most interesting, because most useful, discovery has been made in the upper country, to make prairie fence for 20 cents per rod—and I think it will last forever. It is made of turf or sod, but in a peculiar way, so as to bring the grass wholly outside. If it succeeds, as I believe it will, the question about the immediate cultivation of our large prairies is settled—and millions of acres in Illinois can be put under immediate cultivation.

But I will trespass no longer on your time.

Very respectfully, yours,

J. M. PECK.

The North River is frozen over as far down as Spitendevil Creek, within 12 or 14 miles of the city.

Apparatus and Processes, by Robert Hare, M. D., Professor of Chemistry in the University of Pennsylvania. [Communicated by the Author.]

1. APPARATUS FOR EVOLVING SILICON FROM FLUO-SILICIC ACID GAS.—Into a stout mahogany block as a basis, two iron rods, A, A, are so planted as to extend perpendicularly, and of course parallel to each other, about two feet in height. Upon these rods two iron bars are supported horizontally, one, B, near their upper extremities, the other at the height of about six inches from the wooden basis. In the centre of the lower bar there is a screw, D, having a handle below the bar, and supporting above it a circular wooden block. Into a hole in the upper iron bar, equi-distant from the rods, is inserted a hollow brass cylinder, C, which at the lower end screws into an aperture in a circular plate of brass, E, which is thus supported horizontally a few inches below the bar. By these means room is allowed for the insertion into the cylinder of four valve cocks, each furnished with a gallows screw. The cylinder is surmounted by a stuffing box, through which a copper sliding rod, G, passes air tight. The brass plate is turned and ground to fit a bell-glass of about five inches in diameter, and eight inches in height, which is pressed up when necessary between the plate and the block by the screw D, supporting the block. Within the space comprised by the bell-glass, and on one side

of the centre of the plate, two stout brass wires are inserted, one of them insulated by a collet of leathers, so as to admit of the ignition, by a galvanic discharge, of a small arch of platina wire, which terminates them. The sliding rod, above-mentioned as occupying the stuffing box, terminates below the plate in an elbow, which supports a cap at right angles to the rod, at the same distance from the rod as the platina wire, and on the opposite side of it there is a brass cover, H, for the cap, supported from the plate. The arrangement is such that, by a suitable movement in the sliding rod, made by grasping it by the handle G, in which it terminates externally, the cup may be made either to receive into its cavity the platina wire, or to adjust itself to its cover, H.

The bell being removed, about sixty grains of potassium, in pieces not exceeding more than fifteen grains each, are to be introduced into the cup, which is then to be adjusted to the cover, and the bell secured. In the next place, by means of the flexible lead tubes, P, P, P, P, and the gallows screws attached to the valve cocks, establish a communication severally with an air pump, a self-regulating reservoir of hydrogen, a barometer gage, and a jar over the mercurial cistern containing fluo-silicic acid gas. First, by means of the air pump exhaust the bell, and in order to wash out all remains of atmospheric air, admit hydrogen from the reservoir. Again exhaust, and again admit

hydrogen. Lastly, exhaust the bell of hydrogen and admit the fluo-silicic acid gas. By means of the gage the exhaustion is indicated and measured, and by the same means it will be seen when the pressure of the gas within the bell approaches that of the atmosphere. When this takes place, the cocks being all closed, by means of a calorimotor, the platina wire is to be ignited, and the potassium brought into contact with it.

A peculiar deep red combustion ensues, evolving copiously chocolate colored fumes, which, condensing into flocks of the same hue, subside throughout the receiver, (excepting the color,) like snow in miniature. On removing the bell after the potassium is consumed, the cup which held it will be found to contain silicon, mixed with the fluoride of potassium, and with this indeed the whole of the powder deposited is contaminated. Silicuret of potassium is likewise formed in the cup, since on the affusion of water a fetid evolution of silicuretted hydrogen ensues. By repeated infusions, first in cold, and afterwards in boiling water, agreeably to the directions of Berzelius, the silicon is left in the state of a brownish ash-colored powder.

Thus obtained, silicon does not appear to be acted on either by sulphuric, nitric, fluoric, or muriatic acids; nor when exposed to nitrate of potash, liquified by heat. It seems to be soluble for the most part in a mixture of nitric and fluoric acid, which by analogy we called nitro-fluoric acid; but after exposure for 18 hours to this solvent, a small portion of a black matter remained undissolved. This is, in all probability, carbon derived from the potassium, which, according to Berzelius, when obtained by Brunner's process, is liable to be combined with carbon. The solution of nitro-fluoric acid, decanted from the residual black powder into a solution of pearlash, gave a copious, white, gelatinous precipitate like silex, which, when thrown into a large quantity of water, subsided undissolved. When on subjecting the silicon to red hot nitrate of potash, anhydrous carbonate of the same alkali was added, so as to co-operate with the nitre, an explosive effervescence took place. All the silicon disappeared, and a compound resembling the silicate of potash was produced. This anomalous re-action may be considered as characteristic of silicon.

The impression that the black matter insoluble in the nitro-fluoric acid was carbon, is confirmed by the fact, that after the silicon had been digested for some hours in strong nitric acid, and finally boiled in it to dryness, it dissolved in nitro-fluoric acid without any such residuum.

2. IMPROVED PROCESS FOR THE EVOLUTION OF BORON.—By means of an apparatus represented by the annexed engraving, I have succeeded in evolving boron by the reaction of potassium with vitrified boracic acid in vacuo, without encountering the evil of any explosive action, to which the process as heretofore conducted, in pleno, has been found liable.

A circular brass plate is prepared, like the plate of an air pump, so as to produce, with any suitable receivers properly ground, an air-tight juncture. It is supported on the upper end of a hollow brass cylinder, B, with the bore of which it has a corresponding aperture. The brass cylinder is about three inches in diameter, and six inches in height,

being inserted at its lower end into a block of wood as a basis. This cylinder receives below, a screw, which supports a copper tube, C, of about two inches in diameter, so as to have its axis concentric with that of the cylinder, and to extend about four inches above the plate. The copper tube thus supported is closed at the upper termination by a cup of copper, of a shape nearly hemispherical, and soldered at the upper edge to the edge of the tube; so that the whole of the cavity of the cup is within that of the tube. Hence the bottom of the cup is accessible to any body not larger than the bore of the tube, without any communication arising between the cavity of the tube, and that of any receiver placed upon the plate, over the cup and tube, as in the figure.

Into the side of the cylinder supporting the plate, a valve cock is screwed, by means of which, and a flexible leaden tube, a communication with an air pump is opened, or discontinued, at pleasure.

The cup being first covered with a portion of the vitrified boracic acid, as anhydrous as possible, and finely pulverized, the potassium is introduced, and afterwards covered with a further portion of the same acid, two parts of the potassium being used for one of the acid. A large glass receiver is now to be placed on the plate, secured by rods, A, A, concentric with the tube and cup; from the heat of which the glass is to be protected by a bright cylinder of sheet brass, S, placed around it so as to be concentric with the receiver and tube.

The apparatus being so prepared, and the receiver exhausted of air by means of the

air pump, an incandescent iron is introduced through the bore of the tube, so as to touch the bottom of the copper cup. In a short time a re-action commences, which aiding the influence of the hot iron, renders the cup and its contents red hot. A deep red flame appears throughout the mass, after which the re-action lessens and the heat declines.

When the cup has become cold, the air is admitted into the receiver and the contents are washed with water. If any of the acid has escaped decomposition, it may be removed by boiling the mass with a solution of potash or soda. After this treatment and due desiccation a powder will remain, having the characteristic color and properties of boron.

The additional valve cock, represented in the figure, gives the option of introducing dry hydrogen for the purpose of washing out atmospheric air, as described in the process for silicon.

3. DESCRIPTION OF THE VALVE COCK, A PERFECTLY AIR-TIGHT SUBSTITUTE FOR THE COMMON COCK, ALLUDED TO IN THE PRECEDING ARTICLES.—This figure is intended to illustrate the construction of a substitute for a common cock, which I have been accustomed to call a valve cock. It was devised by me about twenty years ago, among a number of other analogous contrivances, and seems upon the whole less liable to fail than any other which I have tried. The engraving represents a longitudinal section of the valve cock. At *a* is a piston with a collar enclosed in the stuffing box *b*, so as to be rendered air-tight by means of oiled leather. Hence the piston may be turned or made to

revolve on its axis, while incapable of other motion. Upon the end of the piston a thread for a screw is cut, which fits into a female screw in the brass prism *c*, so as to cause this prism to approach to, or retreat from a bearing, covered by leather, in the centre of which there is a perforation, *o o*, communicating with one of the orifices of the instrument. This orifice is surrounded by the male screw *d*, so that by means of this screw the valve-cock may be fastened into an appropriate aperture, properly fitted to receive it, subjecting an interposed leather to such pressure as to create with it an air-tight juncture. The prism *c* has two of its four edges cut off (see fig 2) so as to allow a free passage by it, reaching to the lateral perforation terminating in another orifice, over which there is a gallows screw, *g*. By means of this gallows screw, when requisite, a brass knob, such as that represented by fig. 3, soldered to a leaden pipe, may be fastened to the valve cock. The juncture is rendered air tight by the pressure of the screw in the gallows, upon a leather which is kept in its place by means of the nipple *n*.

The method last mentioned of producing an air-tight juncture, was contrived by me about seven years ago, and proves to be of very great utility. There is no other mode with which I am acquainted, of making a perfectly air-tight communication, between the cavities previously separated, at all comparable to this in facility.

GARDENS OF SHIPS.—To sow in the temperate zone and reap between the tropics, is a somewhat singular thing. Yet it is constantly done. For our great East India ships, in imitation of the Dutch, who first introduced the practice, have little salad gardens in flat wooden boxes on their poops, where the seed, acted upon by a heat increasing daily, shoots up in a surprizingly rapid manner. In these gardens the number of crops in the year are more numerous than in any spot on earth, for

the gardeners, if so minded, can command almost any temperature.

AMERICAN SILK.—On the supposition that we have annually imported silk to the amount of four millions dollars, since 1770, when the first filature of silk was established in Philadelphia, the whole amount of this would be 252,000,000. Had this quantity been raised and manufactured in this country, a far greater number of our people would have been employed than has been in the business attending its importation. The following we take from a communication to the Genesee Farmer :

"In 1770 a filature was established in Philadelphia, and premiums announced.

"In 1771, about 2300 lbs. were brought there to reel. The ladies in particular gave much attention to the subject; as early as 1770, Susanna Wright, of Lancaster county, at Columbia, made a piece of mantua of 60 yards in length from her own cocoons. To give eclat to these *Colonial designs*, the Queen of Great Britain gave her patronage by deigning to appear in a Court dress from this *American Silk*. Yes, in American Silk! but at the present day all our silk dresses, and even our ornaments for public buildings, must be imported. 'Grace Fisher, a minister among Friends, made considerable silk stuff; a piece of her's was presented by Governor Dickinson to the celebrated Catharine Macaulay.' Many ladies, before the Revolution, wore dresses of *American Silk*."

AN IMPROVEMENT IN THE MODE OF RAISING ANNUAL FLOWER SEEDS.—After sowing the patch of seeds, and covering it with fine moist soil, place a garden-pot inversely over it, until the seeds have struck root; then raise the pot up two or three inches, keeping it thus supported for a few days, and then remove it entirely. The pot not only keeps the soil moist, but by the sun heating the pot, the seeds come up much more quickly than otherwise they would do, in consequence of which the seeds need not be sown so early by a fortnight or upwards. The young plants are therefore less exposed to injury from cold or late spring frosts. Hollow tiles, instead of pots, answer equally well, except that where mice are, they have excess to the ends.—[Gardener's Mag.]

WOOL IN ENGLAND.—Mr. Arthur Young calculated the number of sheep in England alone at nearly 29 millions, and the value of the whole growth and labor of wool produced in Great Britain and Ireland at £17,695,529, furnishing employment to about a million and a half of people. However, if we estimate the number of sheep in the whole Island of Great Britain at 28 millions, producing at an average of five pounds weight of wool each, or 140 millions of pounds in all, equal to 583,333 packs, and worth at the rate of 8d. per lb., or £8 per pack, £4,686,664, this is acknowledged to be pretty near the truth. There is also imported into England from Germany, Spain, New South Wales, and other countries, from twenty to twenty-five millions of pounds weight of foreign wool. The value of this wool may be estimated at a higher price than that of English wool; we will, therefore, take it, on an average, to be worth 1s. per pound, or £1,250,000; the value of English and foreign wool manufactured in England will therefore be £5,936,664. If the value of the raw material is quadrupled by the labor employed in manufacturing it into cloth, the growth and labor together will amount to nearly 24 millions sterling, of which nearly one half is exported in a manufactured state, the remainder being consumed in the United Kingdom.

WINE FROM THE COMMON BRAMBLE.—Five measures of the ripe fruit, with one of honey, and six of water, boiled, strained, and left to ferment, then boiled again and put in casks to ferment, are said to produce an excellent wine.

In France, the color of wine is often rendered darker by a mixture of blackberries with grapes.—[Recueil Industriel.]

NEW-YORK AMERICAN.

DECEMBER 28—JANUARY 11, 1834.

HOME INTELLIGENCE.

The Legislature of New York convened on Tuesday. Lieut. Gov. Tracey took the chair in the Senate, and thirty Senators answered to their names.

In the Assembly, 124 members appeared, and balloted for Speaker. Wm. Baker, of Otsego, was chosen, receiving 113 votes. Philip Reynolds, jr., was appointed Clerk; Daniel Dygert, Sergeant at Arms; Alonzo Crosby, Door Keeper; and Samuel Campbell, Assistant Door Keeper.

In both Houses, resolutions to provide the members with newspapers not exceeding the cost of two daily papers for each, were passed. The Governor's Message was received and read, and then both Houses adjourned.

The Governor's Message is of most inconvenient and unprofitable length. It is a mistake in every sense thus to spin out these annual communications, converting them, as it were, into elementary treatises upon every subject they may touch. Bating this objection, the message of Governor Marcy, confines itself as it should do, to State affairs; and of them it gives a flattering, though we doubt not, just view.

The State Prisons more than support themselves, and the number of convicts is decreasing. The Public Schools embrace, it would seem, more than half a million scholars. The Canal receipts exceed largely those of former years; and the Canal fund after buying up a million and a half of the Stock at a high premium, will, in two years, be equal to the whole outstanding debt. Flattering as is this perspective—in regard to new routes of internal improvement, the Governor advises a cautious course. So too, in respect of the the numerous applications for new Banks, he warns against the perils of excess. With these few remarks—and we have room for no more—we dismiss the Message.

NAVAL LYCEUM.—Messrs. Teller Turell and Co. have presented to this institution three fine engravings, in superb frames. One of *Morghan's* last supper, one of Gen. Scott, and one of Washington.

PITTSBURGH, Jan 2.—Our *River Navigation*.—A friend has handed us a statement of the steamboat navigation during the last month. During the month the arrivals and departures of boats were not interrupted during a single day—and there is now as little prospect of the closing of our river as there was in October.

Departures,	-	-	-	74

[Gazette.]

The President has recognized Thomas Dixon as Consul, ad interim, of the King of the Netherlands, for the port of Boston. He has also recognized E. A. Homer, as Consul of Belgium, at Boston. Also, Henry Lefebure, as Consul of Belgium, at Charleston, S. C. Also, C. F. Hoyer, as Consul of the Grand Duke of Baden, at New York.

The following gentlemen have been elected Directors of the United States Bank, for the ensuing year:

Nicholas Biddle,	Daniel W. Cox,
Manuel Eyre,	John Bolton.
Ambrose White,	John R. Naff,
John Sergeant,	William Platt,
James C. Fisher,	Jno. Goddard,
John S. Henry,	Robert Lenox, of New York,
Charles Chauncey,	John Rathbone, Jr. N. York,
Matthew Newkirk,	Geo. Huffman, of Maryland,
Lawrence Lewis,	Roswell L. Colt, Maryland,
John Holmes,	Jno. Potter, of S. Carolina.

Those in italics are new Directors.

Nicholas Biddle, Esq., has been re-elected President of the Bank of the United States.

The Banks.—The abstract of the returns of Banks in Massachusetts, showing the state of said Banks, on the first Saturday of October, 1833, prepared for the use of the Legislature, was distributed this morning. We learn from this document that on the day mentioned the state of the Banks was as follows:

Capital Stock paid in	\$38,236,250 00
Bills in circulation	7,889,110 67
Net Profits on hand	1,293,279 54
Balances due to other Banks	2,881,447 50
Cash deposited, &c. not bearing interest	3,716,182 37
Cash deposited, bearing interest	7,949,440 53
Due from the Banks	52,120,113 11
Gold, silver, &c. in Banks	922,309 84
Real Estate	791,891 77
Bills of Banks in this State	1,646,3 9 53
Bills of Banks elsewhere	250,052 43
Balances due from other Banks	3,363,716 29
Due to the Banks, excepting balances	45,261,003 09
Total resources of the Banks	52,132,218 69
Amount of last dividend	822,225 00
" " reserved profits	709,438 83
Debts secured by pledge of stock	847,549 54
" due, and considered doubtful	207,239 11

Rate of dividend on amount of capital of the Banks, as existing when dividend was made, 3 and 1-14 of 1 per cent. nearly.—[Transcript.]

A fire broke out at mid-night on Wednesday last, in the wing of the Pennsylvania Hospital, allotted to the insane. Happily, the inmates were all removed in safety, to another part of the building, and the flames were speedily extinguished by the firemen. Great praise is awarded to Miffin Wistar, a young physician, resident in the Hospital, for his coolness, and the good arrangements immediately adopted by him for the safety of his helpless patients.

The Mercantile Advertiser of this morning announces on the authority of a letter from Matanzas, the death there on the 14th ult.: of Col. *Dewitt Clinton* son of the late governor Clinton.

"Domestic Manners."—Mrs. Trollope was recently brought before the London Police for unmercifully beating a female domestic. We suppose that the old hag's dislike of American "*help*," grew out of their refusal to be flogged.—The Yankees are peculiar in their "*notions*" about flogging. One way and another, Jonathan's doggedness upon this point, has been the cause of much trouble to John Bull.—[Albany Evening Journal.]

LITERARY NOTICES.

NO. IX.

CLEVELAND, OHIO, NOV. 15.

I took my passage in the stage for this place early in the evening three days since, and having at a late hour bade adieu to more than one whose friendship I trust will not be the less enduring, that it was made in so brief a space of time, retired to my chamber to catch a nap before my morning's ride. The clock was striking three, when, at the call of the porter, I arose, and descended to the bar-room. The attentive landlord himself in waiting, was ruminating before a large coal fire, and stretched upon the floor in a corner, lay the tired domestic, who, having just fulfilled a part of his duty in calling the various stage passengers, was catching a dog-nap in the interval of the stage's calling. The flavor of last night's potatoes still hung around the scene of so many symposia, and the fragrance of more than one recently smoked segar stole, charged with the aroma of whiskey, upon the senses. Cold as it was, I was not sorry to snuff a less scented atmosphere, as each stage that passed the house in succession hurried me vainly to the door. My own proper vehicle came at last, and by the light of the stage lamps, the only ones by the by, which shone through the sleeping city, I swung myself to the driver's box, and took the traveller's favorite seat by his side.—It was as dark as Erebus when we crossed the bridge over the Alleghany, and looking back when we had passed the gate, and were turning into the village, I could distinguish nothing of the city opposite, but the red glare of a furnace which shot out from the bank of the river and glowed an inverted pyramid of light upon its waters. Keeping on our way, the massive walls

of the state prison, with their circular towers and octangular area, frowned like some old Moorish castle over our path, as we drove beneath their dun-colored battlements, and passed the last environs of Pittsburg. It was, I confess, with some softness of heart that I bade a last adieu to a spot where the politeness and hospitality of the inhabitants had made my time pass so pleasantly. I must, however, have been *de trop* among my new acquaintances, had I remained much longer: for in Pittsburg every one is so occupied with business, that the time bestowed in attentions to a stranger is a sacrifice of some importance. I have since been much vexed to find, in looking over my papers here, that a letter of introduction, from a most flattering source, to the U. S. officer now commanding at Pittsburg escaped me untirely. I was chagrined the more, inasmuch as I should both like to have visited the arsenal, and to make the acquaintance of the valued officer, who has charge of it. I had not, however, this reflection to annoy me as, wrapped up warmly, I now rode along, watching the cheerful dawn streaking the east with pencillings of light, and dappling with ruddy rays the broad bosom of the Ohio. As the morning gradually broke, I discovered that the banks of the river presented a different appearance from what they did when I sailed along them ten days before. The November winds had been at work in the woods. The gorgeous panoply of Autumn no longer hung on the forest. The trees stood bare in the growing sunlight, and the thick strewn dead leaves rustled to the tread of the grey squirrel, that leaped from the naked boughs by the road side.

We stopped to breakfast at a low log-built shantee, within a stone's throw of the river, and being asked into a narrow chamber, half parlor half kitchen, I had for the first time an opportunity, as we collected around the breakfast table, to survey my fellow passengers. They were chiefly plain people, small farmers and graziers, returning perhaps from market, where they had been to part with their produce. Their manner, like most of my countrymen of the same class, was grave and decorous at table to a degree approaching to solemnity, though they ate with the rapidity characteristic of Americans at their meals. The ceremony of the board commenced by the oldest man in the company's taking a beef stake before him, and cutting it into small pieces with his own knife and fork. He then passed the dish around to each, and finally when all were served, helped himself. The bread was in the same way circulated by the youngest of the company, and then each having as fair a start as his neighbor, we all fell to work with a lustihood that would have done beef-eating Queen Bess good to have witnessed. The appetites of those present, were generally sharpened by the morning's ride; and, maugre the huge piles of buckwheat cakes that smoked along the board, flanked each by a cold apple pie, the beef stake was decidedly the favorite dish; and was meted out again and again, by the same knife and fork that played a private part the whiles for the stout yeoman who thus plied them for the public good.—Your banbox bred *elegant*, who was ignorant that the Spaniards and the Turks, the two most polite people in the world, thrust their fingers into the reeking bowl of *olla podrida*, or the smoking dish of *pilau*—while, like our sturdy Pennsylvanian, they always help their fellow travellers of the caravanserai, or *posada* before attending to themselves—might have turned up his nose in a transport of Trollopism at such refinement. The charge of vulgarity, however, would rest only with him, who, mistaking the conventional rules of society for the essential principles of politeness, should measure the manners of strangers by the standard of his own narrow circle. There was but one of my fellow passengers, I observed, who ate with his fork. He was better dressed and sat somewhat apart from the rest, interchanging with them none of the homely but hearty civilities, which

they proffered to each other. I set him down as some Eastern shop-keeper, who, though he might have been envied by a Chinese for the chop-stick dexterity with which he managed to chuck the particles of food into his mouth from a two pronged fork, might better have passed the time, spent in acquiring his slight of hand, in gaining real good breeding, from those whom he evidently sat down in his own mind as far beneath him.

Pursuing our journey, we stopped soon after to change horses at *Economy*. I was much disappointed in not having even five minutes to look through this celebrated village, where the German Rapp has so successfully raised a community, who labor in common, and own all their property only as trust members of a corporation. I saw hardly as much of the town, thus passing its suburbs inland, as when sailing by the front on the Ohio. It struck me as remarkably neat, however, and it being Sunday, a perfect silence seemed to reign over the village. Rapp, I believe, unlike most of his co-community-mongers, retains religion, not only as incident to, but an essential feature of, his system. Had it been otherwise, the attempt to form such an establishment could hardly have succeeded as it has. Religion I believe to be an instinct of the human mind—the only one except that of self-preservation, with which we are constituted. It is a feeling which as palpably prompts us to seek a God and to worship him, as does the instinct of a bird suggest the season of building her nest and the materials of its construction. The form of her frail fabric varies indeed with the climate in which it is built, and the character of the winged artificer. But the haughty temples of Heathenism, the sumptuous mosques of the Mussulman, and the Christian's humbler house of worship, may each find a semblance on the towering cliffs or tall tree top, where birds of prey alone will build—in the embowered copse where the luxurious dove delights to brood, or mid the lowly rushes where the lapwing's fragile nest is made. There is, indeed, a stolid race of birds who deposit their eggs upon the barren shore, leaving the sun to vivify or the sea to scatter their contents as chance may determine. But stupid as their offspring must be, who, in constructing an ovary, made no provision for the interesting wants of the rest of the species, because this particular genus is so coarsely constituted. Let us thank Heaven, when, thinking of the privileges of which the intrusive bigotry of foreign infidels at times would strip us, that in our free forest, and there are fields, hills, and groves, where religion, unshackled as a new-fledged bird, may build her altars how and where she pleases.

Our route continuing along the river, we soon passed a fine elevated field on the bank, where Gen. Wayne—or Mad Antony, as he was more familiarly called—encamped with his army that encountered the Indians so successfully near the Miami of the Lakes.

The stone fireplaces of the soldiery, now overgrown with turf, were, with a few other scattered marks of the encampment, discernible upon the ground; and they suggested to one of the passengers the well-known anecdote of the General having one of his men tried and shot for desertion because he had without permission from his officer, accompanied an only brother, his visiter at the camp, a few miles on his return home. The example was a terrible one, but the condition of Wayne's army, from which the men were daily dropping off, strongly required it; and, I confess, that in military affairs I respect the firmness equal to such an occasion too much to merge my admiration of the unblenching disciplinarian in sympathy for the unfortunate sufferer.

We reached the thriving town of Beaver about noon, and crossing the creek of the same name by a high wooden bridge, struck inland, and soon lost sight of the beautiful Ohio in

the broken country that here approaches its banks. A cold shower drove me for protection inside of the stage, and there wrapped up as comfortably as I could, I passed the night. The passengers had gradually dropped off along the road, leaving only a solitary country merchant and myself. We beguiled the time for a while in conversation, and then, as midnight came on, and he grew drowsy, I resigned myself to the same influence that had begun to send sounds any thing but musical from his "innocent nose." Awaking with the sun, I found that we were in the midst of new clearings, the road leading through a level country as far as the eye could reach, and having its sides faced beyond the fields with trees, whose tall stems and interlacing summits stood like giants locking arms along the highway. I must now be in Ohio, thought I, and I was right. The effect of this magnificent vegetation was striking even at this season; but after riding for half a day along such a wood, with not a valley to break the view, nor a hill to bound it, it could not but be monotonous. We passed two lakes in the course of our ride, approaching one of them near enough for me to see that it was a clear sheet of water, with a pretty yellow sand beach. But, though shut up by woods, it wanted entirely the wild yet gentle picturesqueness of the lakes I have seen among and near the highlands of the Hudson; much less could it boast of the savage grandeur of those which form the sources of that princely river.

The most interesting objects on this route are decidedly the growing towns and hamlets which abound along the road. Some of them have been manufactured only this season, and it is really surprizing to see the rude log huts of two years back stand side by side with the tasteful looking dwelling of yesterday, like the old and new branches of one flourishing tree; brick churches and taverns with handsome porticoes the while sprouting up in the same field of stumps. In one village called Hudson, particularly, where by the way much good taste is exhibited in the private houses, the progress of improvement is said to be as perceptible as the rise of the tide at the sea board. I could not, however, discover a palpable growth in the place from the time we sat down to dinner till hurried away from table by the call of the stage-driver. This though might be attributed either to the rapidity with which we despatched our meal, or to my optic nerves not having yet gained the true western nicety. I shall seize the earliest opportunity of practising over a rifle barrel.

We reached Cleaveland during a heavy shower long after nightfall. The roar of the surf reminded me of Rockaway, and the first view of Lake Erie the next morning was really grateful to my eyes. I felt while walking along the high esplanade of turf which here forms its banks, and upon which the town is built, like one who has just come out of a pent-up chamber into the full and free air of heaven. The effect of coming on such a wide expanse of water when just emerging from the forest, is much greater than when, after long riding through an open country, you view the ocean stretched beyond its shining beach.

Cleaveland is very prettily situated upon the lake. The Cayuhoga makes a bend around a high bluff as it passes into the inland sea which receives its waters, and, on the level peninsula thus formed, is built the town. The harbor, naturally an indifferent one, has been much improved by running out a pier from either side of the river, where it debouches into Lake Erie, and there being now but few better ports on this side of the lake, Cleaveland must become one of the most important places on its waters. The adjacent region is, I believe, not remarkably well suited to agricultural purposes, but there is an immense tract of the most fertile country inland which looks to Cleaveland for the chief outlet of its products. This will account for the rapid rise

of property here, which is almost incredible, building lots in some places commanding now as many thousands as they did hundreds of dollars five years since. The town, which can already boast of a public library, a fine church, two capital taverns, and many handsome private dwellings, is laid out with broad streets and a spacious square in the centre. The business part is as yet beneath the bluff, where a single winding street runs along the bank of the river toward the lake; but the main street above is already the scene of much bustle, and bears about the same relation to that below as Broadway does to South street in your city.

I have been happy here to meet with some old school fellows settled in the place—where indeed among our wandering people can one tread without finding an acquaintance?—and this morning I was agreeably surprised by finding an English groom waiting at the door for me with a fine saddle horse, and mentioning that my friend, its owner, would soon join me with another. We first rode out through a clearing, back of the village, and enjoyed a very pretty prospect of the Cayuhoga winding through a piece of rich meadow land below us, and affording, as the high grounds recede at its entrance into the lake, a striking view of Erie in the distance. Returning upon our tracks, we passed the village on the east, and then rode westerly along the shore of the lake. The banks, which are high and covered with sod on the top, are here composed of clay and gravel: on the surface they appear perfectly firm, but for the distance of nearly a mile along shore they have sunken, or are sinking, to the breadth of about 300 feet and slid off into the lake, whose waters thus swallow building lots worth an immense amount of money. The cause is believed to lie in quicksands beneath, and it offers a singular phenomenon to stand on the shore below, and marking the sunken platforms of earth behind, you see where half an acre of clay has risen through the sandy beach in front, within a few inches of the surface of the water.

The treacherous attributes of the shore suggested to my companion, who, though young, has been a traveller in his day, an incident he witnessed while journeying through some of the remote provinces, which would make no feeble subject for the pencil of Weir or Inman. He had ridden with an English gentleman for many hours through an unsettled country where not a drop of water was to be obtained for their horses, when, coming suddenly upon a clear stream sparkling over its bed of yellow sand, their weary beasts sprang forward simultaneously to drink from the grateful current. A break in the bank caused their riders to rein up and dismount, retaining at the same time the loosened reins in their hands, while their horses stepped down to the margin of the brook. The American, finding that the deceitful bottom yielded as soon as touched, jerked his terrified beast from the fatal spot, while as yet his fore feet were only immersed in the quicksand. But the horse of the Englishman, in his eagerness to get at the water, made but one step to destruction. He sunk floundering to his shoulders before an effort could be made to rescue him; and then, as in struggles to extricate himself from the engulfing pool, he heaved his broad chest high above its surface, the sucking sands drew his quarters in a moment beneath them. The nostrils of the suffering animal dilated with the fierce death encounter, and giving that hideous cry—

"The cry of steeds that shriek in agony,"

he tossed his head frantically above his greedy grave—his mane fluttered for a moment on the shallow water, and the bed of the stream closed over him for ever.

H.

HISTORY OF THE HARTFORD CONVENTION, with a review of the policy of the United States Government, which led to the war of 1812—by THEODORE DWIGHT, Secretary of the Convention. 1 vol. 8vo. pp. 450. New York: N. & J. WHITE.—If history be

philosophy teaching by example, we have in this book a lesson which should not be lost on the present and future generations. The events of which it treats may now be considered dispassionately, and so completely historical, as not to disturb any existing relations of parties or partisans. These, indeed, since the day of the Hartford Convention, have undergone so complete a fusion, that many of its most vehement supporters are now found as vehement in behalf of the distinguished soldier, who, according to his own declaration, would have hanged all the members of that Convention under "the second section"—or any other he liked better. A generation of men have passed from the stage since that epoch; and by far the greater portion of those who now by their votes determine the march and character of this government, are of an entirely new generation. To the actors on the political scene of that day, they may therefore be said to stand in the light of posterity, and should judge with the impartiality of posterity the acts and motives of those times. To all capable of so judging, we hazard nothing in saying, that they will derive from Mr. Dwight's book, certainly instruction as to many interesting historical points, and as certainly in our judgment, the conviction that through party prejudice and passion, and the excitement of a state of war, the greatest injustice has been done to the motives, characters and acts of the distinguished and able men who composed the Hartford Convention. We give this opinion with the more confidence, because we have ourselves felt and surrendered to the force of the evidence here brought together and displayed with full effect, that in no way and at no time was any project entertained or proposition uttered by that Convention, or any of its members, *inconsistent with their obligations as members of the Union*. From peculiar circumstances, and, though disapproving the war, being then with a militia command in the service of the United States, and eager in common with every American to resent and avenge the outrages perpetrated by the enemy along our defenceless frontiers, the writer of these remarks did look upon the assembling of the Hartford Convention with most unfriendly feelings—feelings of which the influence has only yielded, even at this late day, to the demonstration of Mr. Dwight's book. If, therefore, to remove unfounded prejudice, or correct erroneous opinions, be to confer, as we think it is, a great benefit, we personally acknowledge our obligations, on that head, to this writer; and though we still hesitate as to the expediency, under any circumstances, in time of war, of such a Convention, we must admit that if ever circumstances could justify it, they existed for the New England States at that period. We have not the time, however, to enlarge upon these matters now; we therefore merely add in conclusion, that in the historical review of the policy of the government of the United States which led to the war of 1812, not less than in the more immediate records of the acts and proceedings of the Hartford Convention, all readers, even those who may think they have kept pretty accurately the run of public affairs, will find materials, public documents, and most significant public acts, brought into a juxtaposition, and made tributary to conclusions, which it will be more easy to condemn than to disprove.

A LECTURE INTRODUCTORY TO THE COURSE OF SCIENTIFIC LECTURES BEFORE THE MECHANICS' INSTITUTE OF THE CITY OF NEW YORK; delivered Nov. 27, 1833, by G. C. VERBLANK: N. York, G. P. SCOTT & Co.—In felicity of selection, of language, and of illustration, the topics presented in this discourse are alike remarkable. The taste of the scholar, combined with a practical acquaintance with the wants of the active and industrious classes—honest and safe because active and industrious—is beautifully displayed throughout; and examples of power to excite the noblest emulation in every mechanic, are drawn from the mechanic arts, to prove how important and efficient to great results, is the union of theory with practice, of science with manual skill. We wish our space would allow us to make some extracts; but it is impossible. We learn, however, with great satisfaction, that the whole address is to be printed in the next number of that excellent periodical, "The Mechanics' Magazine." It will then go widely into the hands of those for whose advantage and encouragement it was designed, and is so admirably adapted.

ADDRESS BEFORE THE PHI BETA KAPPA SOCIETY of Yale College, by EDWARD EVERETT New Haven: HAZ. HOWE & Co.—Mr. Everett could not treat of the subject of education, which is the leading topic of this address, and of its influence in moulding, civilizing, and refining the human race,

without eloquence and unction. Both are exhibited in this address; and although we think a little too much, perhaps, is conceded to the power of culture to produce, under the same circumstances, nearly, upon an average, equal results, none can deny, that on all natures, its influence is very great. We must make an opportunity at some other time, to extract the striking illustration adduced by the speaker, to show the effects of education—of the New Zealand savage, and the skilful mariner who, through trackless seas, conducts to the shores of that savage, so frail and complicated a structure as a ship.

AN INTRODUCTORY LECTURE before the Brooklyn Lyceum, delivered 7th November; by THEODORE EAMES.—We published some days ago an account of this creditable and useful association lately entered into in Brooklyn; and we have read with pleasure the discourse of Mr. Eames on the opening of the Lectures. It is a sensible explanation of the origin and uses of Lyceums, and of the benefits which they are so well fitted to ensure.

BIBLIOTHEQUE CHOISIE DE LITERATURE FRANCAISE, No's 11 and 12. Philadelphia: CAREY, LEA & BLANCHARD. New York: CHARLES DE BEHR.—This select Library of modern French literature is in some sense like the family libraries in English, a republication of entire books, but a republication in semi-monthly numbers. Each of these contains 60 pages; and we may say that care is taken to exclude from the work every thing that would induce a doubt about putting this "library" into female hands.

LA FRANCE LITTERAIRE, No's 1 and 2. New York.—Another French periodical is here before us—well printed, and of well selected contents—appearing every fortnight, so as, at the end of the year, to constitute six large 8vo. volumes—and sell for four dollars per annum. We confess our gratification at thus seeing the current literature of France naturalized among us; and trust that this work, which is in the French what Littell's excellent *Museum* is to the English periodical writings of the day—a tasteful and judicious selection of the best—will meet ample encouragement.

THE SOCIAL EVILS AND THEIR REMEDY—By the Rev. CHAS. B. TAYLER, M. A. 1 vol. N. Y.—HARPER & BROTHERS.—They who have read "The Records of a Good Man's Life," need not be told by us that the series of narratives of which that now under notice is the first, from the same pen, is of high merit and holy aims. The idea of this series is, we think, evidently borrowed from the tales of Miss Martineau; and from some expressions in the reverend author's preliminary address to his readers respecting political economy, and what he may consider "right views thereof," and the necessity of teaching it, always as subordinate in claims and interest to "Christian economy," we are led to infer, that he considers the pre-eminence given in those tales to motives connected with present interests and wants, as undervaluing the higher motives derived from and inculcated by Christianity. We should regret this, for we believe political economy to be, not only in harmony with the dictates, but conducive to the influence, of religion, and as aiding by the intelligent forethought and the spirit of order and method which it induces, the spread of all other truths, and of that most especially which is pre-eminently THE TRUTH. It would, therefore, as we apprehend, be doing a real disservice to both political economy and religion that so just and reasonable a thinker as Mr. Tayler should considerately sanction the idea that there is any incompatibility between them. But as our apprehension on this score is rather surmise than certainty, we dismiss it, for the present, to say of the first narrative that it is most happily conceived and carried on; excepting, perhaps, a too obvious design and display of the means by which indeed in every condition of life good principles can alone be practically founded and preserved—a belief in, and habitual resort to, the pages of the revealed volume—but which may fail of their effect upon unwilling or unaccustomed natures, by being put forth too prominently at the onset.

This first volume is addressed to mechanics, and its object is to inculcate upon them the absolute ne-

cessity of order and degree in all societies, the danger of listening to the preacher of infidelity and turbulence, and of rejecting the old and wise ways of happiness, to seek after shorter and pleasanter paths, under leaders who are not less blind than those they set up to guide. It inculcates the sound and wholesome doctrine, that respectability, usefulness, and duty, in whatever walk of life we may be placed, depend, not upon our vocation, but upon our manner of fulfilling it; and that there is no honest calling, be it ever so humble, that he who follows it may not dignify and adorn, by a well-ordered, industrious, and above all, religious life.

The next number of "Social Evils," is to treat of the other sex, under the title of "The Lady and the Lady's Maid."

AN ADDRESS, DELIVERED BEFORE THE GENERAL TRADES UNION OF THE CITY OF NEW YORK; BY ELY MOORE, President of the Union. New York: JAMES ORMOND.—This is, in many points of view, a remarkable address. The occasion, the association to which it was delivered, and the language which it holds, are all peculiar and unusual. The Trades Union, as we gather from this pamphlet, is instituted by the producing classes, "in order to guard against the encroachments of aristocracy, to preserve our natural and political rights, to elevate our moral and intellectual condition, to promote our pecuniary interests, to narrow the line of distinction between the journeyman and employer, to establish the honor and safety of our vocation upon a more secure and permanent basis, and to alleviate the distresses of those suffering from want of employment." In plain and direct language, this is, we presume, an association of journeymen of different trades, with some masters, perhaps, among them, to regulate by combination, their own wages, and by co-operation of many to sustain the efforts of those of any particular trade in enforcing their "natural and political rights." That such a union is contrary to the common law, is admitted by the speaker himself, who, however, insists, that such law being in his judgment at variance with the genius and spirit of our institutions, it ought to be abrogated, and, meantime, he and his associates act as if it were. But in our opinion, the general scope of Mr. Moore's doctrines is more in hostility with the genius of our institutions than that doctrine of the common law which he condemns. We may say, by the way, that to the reasonableness of this doctrine we do not assent, and can perceive no reason in natural justice, or even in sound policy, why men may not, and should not, if they choose, combine for higher wages—so they do it voluntarily, each for himself, and without the use of force or menace against those of the same craft, who do not choose to join the combination, or against their employers—leaving to masters the same right to combine, if they choose, against workmen, and to each party the risk and loss of such attempts. The moment, however, that by force or intimidation a reluctant journeyman is made to give up the wages he was content to work for, and join the combination, that moment an offence against social and individual rights is committed, which should be vindictively punished. With this understanding, we are content to go with Mr. Moore in doing away the common law offence of combination. Mr. Moore's principles, however—by their tendency to create distinctions between classes of citizens, all alike equal in their rights and before the law; to combine the whole active industry, as it were, of the country against its wealth; and to impose—if they could be enforced, which they never can be—an arbitrary value upon what is in its nature ever varying, differing at different times, and at all times in different individuals—labor and skill,—do strike directly at the freedom, equality and security both of person and property guaranteed by our institutions. "Aristocracy"

is the hydra which "the productive classes" have, it is said, to contend against, and aristocracy is here explained to mean wealth. Now this aristocracy is within the reach certainly of every industrious man's reasonable hopes—however humble his commencement—and the wisdom of depreciating in advance, and rendering obnoxious, that which each and all are striving to attain, may well be questioned. It is indeed true that wealth, unaccompanied by education—in which term we include the culture of the heart, as well as of the understanding—is apt to produce arrogance and a certain scornful looking down upon those less fortunate competitors who yet toil in poverty; but this, so far from being a general characteristic, may be said to be almost peculiar to those who, having emerged from obscurity to opulence, without the restraints of moral and intellectual discipline, seem chiefly to value riches for the elevation at which they are thereby placed above those with whom they began life. In the way of overbearing, intolerant, coarse-mouthed and hard-hearted "aristocrats"—men who look upon poverty as a crime, and have none but words of harshness and reproof for misfortune—the most genuine, as well as the most offensive specimens are invariably to be found among persons of this description. Every observing reader must know, or have known, instances in point; and it is not the least curious part in such a history, that they who began life perhaps railing at aristocrats and aristocracy, and afterwards attained that enviable and much lampooned condition, are among the loudest frequently still to keep up the cry—of the truth of which, as implying harshness to inferiors, they judge from their own course; and of the efficiency of which, as a rallying cry to marshal the many against the few, they have had personal experience. But we are running on into a dissertation far beyond our purpose on sitting down, or our space. Of the talents of Mr. Moore, as they appear in this address, we are disposed to think well. Of his aims, and those of his associates, we disapprove, as subversive, in our judgment, of order, and illusory moreover in practice; yet we believe there is no premeditated purpose of evil in the "Trades Union;" and under due regulation, as conducing to emulation and mutual endeavors to enlighten and improve each other, and exalt each other's vocation, it might lead to good. We could wish, however, that Miss Martineau's tales were household volumes among the members of the Union; and we should not be sorry if the work noticed immediately before this, of Dr. Tayler, were also in the hands of each one of them. It is by such studies and with such guides that "the productive classes" will best assure their own happiness and respectability, and promote those of the communities of which they form so large and influential a part.

HISTORY OF THE CHURCH, from the birth of Christ to the present time, by CHAS. A. GOODRICH; 1 vol. pp. 500; New York, JUSTIN CARPENTER.—This is a curious compilation, which purports to give the history, not only of the church, but of all different sects, with biographical notices of their martyrs; which extends its notice to Mahometans, as well as Jews and Christians; and comprises, in short, or professes to do so, every sort of information respecting all sorts of creeds, rites and ceremonies. The book is divided into eight periods, each embracing a certain term of time. There are numerous wood cuts, withal; and the work, if executed with ordinary fidelity—of which we confess we have not yet read enough in it to enable us to judge—cannot but impart much useful and more curious information.

THE AMERICAN MONTHLY MAGAZINE, for January 1834. New York: M. BANCROFT.—This is a capital number, with papers in it that would do honor to the best Magazine extant. We would mention particularly "the Specimen of the Italian dramatists," and

"the Eve of St. Bartlemy." Good taste and poetical talent, as well as familiarity with the literature of Italy, are charmingly displayed in the first, and the thorough knowledge of the spirit of the times in which the second is cast, and the vigorous portraiture of character it exhibits, are quite remarkable. There are other papers of merit, but these bear the palm.

GREENBANK'S PERIODICAL LIBRARY, Vol. III. No's 7 and 8. Philadelphia. These numbers contain the autobiography of Galt, printed with the usual distinctness of this very cheap publication.

THE PARLOR JOURNAL. New York: PEABODY & Co.—This is a very flashy looking weekly; and if pretty types, pretty pictures, music, fashions and light talk and criticism, can make a work acceptable, this may hope to succeed.

GOVERNOR'S MESSAGE.

Fellow Citizens of the Senate and Assembly:

In performing the duty which requires me at this time to submit to your consideration the condition of the state, I feel peculiar gratification in being able to assure you that it is unusually prosperous.

As a member of the confederacy, we have no cause of alarm at any encroachment on our rights as a sovereign State. The General Government is moving in the proper sphere of its delegated powers, diligent to understand the interests committed to its charge, and devoted to the duties essential to the general security of the nation. Practising upon its avowed principle, of asking nothing that is not clearly right, and submitting to nothing that is wrong, it continues to maintain a friendly intercourse with all other nations, on terms of fair reciprocity.

The extraordinary attitude assumed at the commencement of the last year, by the state of South Carolina, in regard to the authority of the federal government, excited some apprehensions for the peace, if not for the stability, of the Union, and imposed upon that government, exceedingly delicate and embarrassing duties. We have great reason to rejoice that our national affairs were in the hands of those who were peculiarly fitted for such a crisis, and who were enabled by their wisdom, firmness and moderation, to conduct this unhappy controversy to a peaceful issue, without conceding any right belonging to the General Government, or giving any countenance to the novel and dangerous doctrine of Nullification.

Between this State and New Jersey a dispute has for a long time existed, concerning boundaries and jurisdiction. Several attempts have been heretofore made, to adjust this controversy in an amicable way; but they had all terminated unsuccessfully, and proceedings were instituted on the part of New Jersey, in the supreme court of the United States, to bring it to a judicial decision. The mutual desire of the citizens of the two states to preserve harmony between them, seemed to leave the way still open for an honorable compromise. The Executive of each state was last year authorized to appoint commissioners to effect this object. These commissioners have agreed upon terms of adjustment, which they deem to be equitable and mutually beneficial to the parties.—This agreement is not obligatory on either state, until it is confirmed by the legislature of each, and approved by congress. It is herewith transmitted for your ratification, if it shall be found, as I believe it will be, compatible with our honor and our interests. The Union is to be preserved and strengthened by concord among its members. The sentiments of patriotism, as well as a regard to our local interests, will inspire you with a desire to remove the only known cause that can disturb our friendly relations with any of the states.

From this view of our external relations, permit me to direct your attention to our internal affairs.—To the spirit of our free government, to the wise legislation of your predecessors, but, above all, to the kind regards of a gracious Providence, we are indebted for our present unexampled prosperity. No pestilence has been permitted, within the last year, to visit our citizens; our agricultural products have been abundant; manufacturing establishments have multiplied in all parts of the state; commerce has expanded beyond its former limits; enterprise is exerting its energies in all directions; and the gratifying evidences of moral and intellectual improvement are every where around us. Let it not, however, be supposed that this fulness of prosperity has superseded the labors of legislation. Evils exist that require

correction; and new wants are constantly disclosed, that cannot be fully supplied without your aid.

Every wise system of municipal laws necessarily contains within itself an adequate provision for the due execution of them. Laws are rendered effective only by the agency of public officers. The judiciary is an essential branch of all governments; to those of liberal principles it is, and ever will be, an object of much solicitude, and the more so in proportion to the sacred regard which is cherished for personal security and the rights of property. It must be accommodated to the duties devolved upon it. When we take into view the rapid increase of this state in population, and the still more rapid augmentation of its business transactions, both of which greatly multiply the labors of the judiciary, we must, I think, be convinced that our present establishment, though adequate to the public exigencies when first organized, now needs to be enlarged. Both the ability and the diligence of our higher courts are admitted; yet the business in them has so greatly increased, and the prospect of its further accumulation is so certain, that it has become your duty to deliberate on the means of affording relief. It is not so much to subserve the convenience of the courts overburdened with business, as to relieve parties from expense and loss, that such a measure has become expedient. Delay is not only attended with additional costs, but in many cases it is a denial of justice.

The organization of a Vice Chancellor's court in the city of New York, has fulfilled the public expectations of its usefulness. It is suggested whether one or two other similar courts, in other parts of the State, might not prove useful auxiliaries, not only to the Court of Chancery, but to the Supreme Court.—To such courts the equity business of the circuit judges might be assigned; and most of the interlocutory proceedings in the Supreme Court might be transferred to these judges. The pressure of business is on the Court of Chancery and the Supreme Court, and on a few of the circuit judges, in consequence of their Chancery business. If two Vice Chancellor's Courts should be organized, it might not be necessary to increase the number of judicial officers. Two of the circuit judges might be appointed to preside in them, and the number of circuits reduced to six. It is believed that six judges would be able to perform all the circuit duties, together with such interlocutory business as could be properly devolved on them.

If upon mature deliberation, this measure should not be deemed a proper or an effectual remedy for the public inconvenience, there appears to be no other course left, but to amend the Constitution, and thereby increase the number of judges, or create other courts to participate in the business of those which now possess general jurisdiction.

Judges, like all other public servants, have certainly a just claim to a fair allowance for their official services: and in settling it, due consideration should be given as well to the qualifications required for such stations, as to the arduous and responsible duties imposed by them. It is true that judicial offices are highly honorable, and are generally aspired to with better motives than a regard to the measure of compensation; but this circumstance does not render an adequate reward to judges less an act of justice, or a dictate of sound policy.

Economy is the virtue of republican governments, but it is as distinguishable from parsimony as from profusion. It requires that faithful public services should be fully, and no more than fully, paid; and it is as much the duty of the Legislature to bring to this standard, salaries that are too low, as those that are too high. In forming an opinion as to the compensation to be given to judges, it is proper to look at all the circumstances connected with the subject; to their situation, which necessarily debars them from all private pursuits; to their qualifications, which result from a union of moral worth, high intellectual powers, and extensive acquirements; to the services they are required to perform, which, in this state, are more important and laborious than those imposed upon the judiciary of any other state. If, in addition to these considerations, we compare the present compensation of the judges in our higher courts, with the salaries given to such functionaries in other states, or with the salaries formerly given here without the imputation of extravagance, we are, I think, necessarily brought to the conclusion that our judges are inadequately paid. I should neglect what I think due to an important department of the government, if I omitted to invite you to deliberate on this subject.

The business transactions of this state are almost wholly founded on credits. It should therefore be the object of legislation to provide for the faithful

execution of contracts. In 1831, an important change was made in the law on this subject, by abolishing imprisonment in certain cases. This change has, to some extent, excited dissatisfaction among the people; but most of it, I believe, is to be ascribed rather to the defects of the law, than to its principle. Its real object is in accordance with the spirit of the age. No reasonable objection can be urged against exempting the honest debtor, who is without the ability to pay, from imprisonment; but great care should be taken to prevent such a wholesome provision of law from becoming a refuge for dishonesty and fraud. It was scarcely to be expected in such a case, that all the safeguards against abuses and perversions could have been provided, without the light of experience. This law has been nearly two years in operation, and its prominent defects are now developed, and I trust your attention will be carefully directed to devising adequate remedies for them.

Our penitentiary establishments are objects of great public interest, and must ever draw towards them the anxious regards of the legislature. The improvements by this state in prison discipline, have been imitated by other states, and have attracted the attention of several governments in Europe. The commissioners sent from abroad to examine our penitentiaries, and ascertain their practical operation, have bestowed on both high commendation. By means of these establishments, we have been enabled to meliorate our criminal code, with safety to the rights of persons and property, and in a great measure to relieve the people from a heavy annual burden for the support of convicts.

The operations of the state prisons continue to present favorable results. The number of persons received into them during the last year, is less than that of the previous year: and the avails of the labor performed by the convicts have defrayed the ordinary expenses of these establishments, and yielded a surplus income of eleven thousand eight hundred and eighty dollars and thirty-one cents.

It was feared that the diminution of the number of convicts in 1832, from that of 1831, was to be ascribed to the effects of the cholera, which had interrupted some of the courts; but the reports of the past year have removed this apprehension, and proved, that while our population is rapidly increasing, crimes punishable in the state prisons are decreasing. The whole number of convicts in the Auburn prison on the first day of December last, was six hundred and seventy-two. One hundred and seventy-one had then been received since the first day of January last, which exceeds by thirty-nine the number received in the previous year. The whole number of convicts in the Mount Pleasant prison on the first day of December last, was eight hundred and thirty-three; and the number received previous to that date, in 1833, was two hundred and nineteen, which is seventy less than the number received in the preceding year.

The earnings of the convicts in the Mount Pleasant prison, during the last fiscal year, which closed on the thirtieth of September, were sixty-seven thousand five hundred and forty-eight dollars and sixty-five cents; which exceeds the ordinary expenses of that establishment, not including therein the charge of the corporation of New York for keeping the female convicts, three thousand two hundred and fifty-five dollars and twenty-six cents. A part of this surplus has been expended in building a range of workshops, two hundred and forty feet in length. No appropriation, either for the support of this prison, or for any additional improvements to it, will be required for the current year.

The earnings of the convicts in the Auburn prison, for the last fiscal year, were forty-nine thousand six hundred and sixty-five dollars and fifty cents. This sum produces a surplus, after deducting the ordinary expenses of the prison, of eight thousand six hundred and twenty-five dollars and five cents.—Some portion of this surplus has been expended in altering and repairing the south wing of this prison. This work was deemed necessary for the preservation of the edifice, and for accommodating the establishment with a chapel and mess-room. From the representations of the officers, and from personal observation, I am convinced that a regard to the safety of this prison, and the accommodation of its business, requires that its enclosure should be considerably enlarged. This improvement cannot be made without your authority, and will probably involve an expenditure beyond the surplus income of the establishment.

Although we have done much for the improvement of prison discipline, much more remains to be done. There is one class of criminals to which it cannot be extended without another establishment. Every

year's experience confirms the propriety of the repeated and urgent recommendations which have been made to your predecessors, in favor of providing a separate prison for female convicts. The number of these now is 53. Twenty-three of them are in the Auburn prison; but the salutary influence of its admirable discipline cannot be fully extended to them for the want of proper accommodations. The remaining thirty are confined at Bellevue in the city of New York, at the annual charge of one hundred dollars for each convict, paid by the State to that city. Even economy, which is less to be regarded in this matter than other considerations, would be promoted by such an establishment. Most of the labor of erecting it, might be performed by the convicts of the Mount Pleasant and the Auburn prisons. I earnestly invite your attention to this subject.

Whatever diminishes minor offences will also diminish those of a higher grade; we ought, therefore, to apply our correctives to the incipient steps of transgression, with the double view of preventing crimes, and of reforming offenders. If long experience has taught any one lesson on this subject more clearly than another, it is that the association of criminals in idleness, with opportunities of unrestrained intercourse, renders reformation almost hopeless, and mutual contamination nearly certain.

The persons convicted of minor offences, are more than three times as numerous as the State prison convicts; and more than half of them are sentenced to be imprisoned in the county jails. As places of punishment, jails are much more objectionable than the State prisons were before their discipline was improved. Until establishments for punishing these offenders are provided, to which the salutary discipline of the state prisons can be extended, it is in vain to expect any considerable diminution of crimes, either of the lower or higher grade.

There is no institution partaking of the character of a penitentiary, that can be regarded with so much satisfaction as the House of Refuge for juvenile delinquents in the city of New York. The benevolent and humane individuals to whom this institution owes its existence, and who have generously devoted their labor and means to rear up and sustain it, have not been disappointed in the only reward they expected—the satisfaction of having been instrumental in rescuing many fellow-beings from misery and crime, and turning them into the path of virtue and usefulness. This institution admirably combines the advantages of education and moral instruction with a preparation for business pursuits. Its guardian care does not cease with its direct control over these delinquents; it follows them into society, and secures them from relapsing into criminal conduct by placing them in situations where they can, not only obtain a livelihood, but enjoy the ordinary means of becoming useful citizens.

It has been satisfactorily ascertained that most of those who have gone from this institution, have since pursued a virtuous course of life, and many of them are already established in business with the fairest prospects of success. This happy result is doubtless to be attributed, in a great measure, to the supervision over them which extends beyond the period of their actual imprisonment, and provides for them a proper employment. I am persuaded that some assistance of this kind afforded to convicts when first discharged from the state prisons, would, in many instances, prevent their relapses into crime. The House of Refuge now contains two hundred and thirty-three inmates; but it never has had as large a number as it could accommodate. This, I am sure, would not be the case, if magistrates who have the power to send juvenile delinquents to it, were fully apprised of the decided advantages of its discipline over any other mode of punishment.—The managers of this establishment are making laudable efforts to enlarge it, so as to accommodate colored children; but they have not yet been able to raise the means required for this object. If they should be obliged to solicit aid from the legislature, the merits of the application will entitle it to a favorable consideration.

There are two institutions in this state for the instruction of the deaf and dumb—the New York Asylum, and the Central Asylum at Canajoharie. The number of pupils in both is one hundred and sixty-five. One hundred and thirty-four of them are in the school at New York. Ninety-six of these and twenty-four in the Central Asylum at Canajoharie, are educated by the state at an annual expense of fourteen thousand four hundred dollars.

By an act passed in 1822, the supervisors are au-

thorized in certain cases, to select from their respective counties, indigent mutes, and send them to these institutions, which are required to instruct them on such terms as the state pupils are received. This authority has not been exercised by any of the counties except those of New York and Montgomery; not for want of fit subjects, but probably from an unwillingness to levy the expenses that would be thereby incurred. It is worthy of your consideration, whether the exercise of this authority, which is now optional with the supervisors, might not be properly made an imperative duty.

Interesting as is this class of persons to our humane feelings, and claiming as they certainly do your sympathy, and a liberal degree of your care and patronage, there is another class, larger in number, and still more unfortunate in condition, who have a rightful claim to a greater share of your compassion and an equally liberal measure of your assistance. I refer to the insane—and more particularly, to the insane poor. We should be deaf to the most powerful appeal of suffering humanity, and wanting in gratitude to God, who has endowed us with the faculty of reason, and blessed us with abundant means of administering to the wants of others, if we did not use both, for the comfort, and, to every practicable extent for the cure of those who are deprived of these gifts. It, indeed, the diseases of the mind lay beyond the reach of human agency, it would be still our duty to afford these sufferers all the comfort and consolation which could be enjoyed in such a forlorn condition. But recent experience has proved, that in a few cases only, is their doom irrevocable. Medical science and mental philosophy have finally obtained an almost entire dominion over these maladies. There is, however, this peculiarity in the cases of insanity, that little hope of effecting a cure can be indulged, without the conveniences of proper institutions. The Asylum at Bloomingdale, under the management of the Governors of the New York Hospital, is the only establishment affording accommodations for insane patients, which has received any assistance from the public treasury. The state has already paid, for founding and supporting it, one hundred and seventy thousand dollars; and has made provision for an annual payment towards its support, of ten thousand dollars, until the year 1857. It is, however, inadequate to the public wants. Besides, this institution is, in effect closed to that class of insane patients presenting the strongest claims for your bounty—to those who are unable to contribute to their own maintenance. Poverty is sometimes the cause, and oftener the consequence of mental derangement. For those who labor under this double affliction, nothing has been done specifically by the legislature. By the census of 1825, it appears that there were in this state, eight hundred and nineteen lunatics; and if the number has increased proportionably with the population, it cannot be less at this time, than one thousand. Of these, seven hundred at least, are paupers, and most of them utterly beyond all reasonable hope of recovery, without legislative aid. If any thing were wanting to urge you to vigorous action on this subject, and call forth your patronage in behalf of these sufferers, it will be found in the well authenticated fact, that of recent cases under the treatment of the best regulated asylums, eighty and sometimes ninety patients in an hundred, have been restored, and even those who have been long neglected and cruelly misused, are not in a hopeless state. If the victims of disordered intellects had not been deprived of the usual means of exciting public compassion, or if they could have come forth from the places of their confinement, to exhibit their deplorable condition to the public eye, I cannot believe that a provision for their relief would have been delayed to this late day. If the claims of humanity in this respect, have been disregarded, you have now the power, and I doubt not will feel the disposition, to satisfy them.

The blind also, are another class of persons upon whom misfortune had laid a heavy hand, and who have a just claim to something more substantial than bare sympathy. Books have recently been made with embossed letters, whereby they are enabled, after a proper course of instruction, to read with considerable facility. By this ingenious contrivance, a new avenue is opened to their minds, and simpler means of knowledge brought within their reach. The number of persons suffering under the deprivation of sight, in this state, cannot be accurately estimated; but it is very considerable—sufficiently so, at least, to make their condition a subject worthy of your attention and kind regard.

The establishment of county poor-houses has been generally attended with beneficial results. In them, paupers enjoy more comforts than could be extended to them in the former way of providing for their sup-

port. In most cases, they receive kind treatment; the able are put to work; the sick are carefully nursed, and well supplied with medical attendance; the young are furnished with the means of education, and enjoy opportunities of moral and religious instruction. The general burden of support has been greatly diminished wherever these houses have been established and properly managed. This system, particularly in what regards its police, is undoubtedly susceptible of some improvements. All who are received into these houses should be treated with kindness; but the idle should not find them places of repose from labor, if they are able to work; nor should those who have been brought into them by their vices, be allowed opportunities for further indulgence.

There are many charitable and benevolent institutions in the State, and particularly in the city of New York, of great usefulness, which I would commend to your favorable regard. It is your duty to second individual efforts in building up and sustaining establishments, which are fitly designed to reclaim the vicious, to relieve the distressed, and to enlighten the ignorant.

From the consideration of subjects which relate to the relief of the unfortunate, I pass to those which regard public education and moral improvement. Republics should be ever mindful of this important truth, that to be free, man must be educated. Without a knowledge of his rights, he will never properly estimate nor long maintain them. Our enjoyments as individuals—our usefulness as members of society—our privileges as citizens of a free government, are all founded on education. These obvious propositions show at once the vast importance of our system of public instruction, and the necessity of so improving it as to give to its operations the utmost extension and the greatest efficacy. While we are reposing our hopes for the continuance of civil liberty upon the general intelligence of the people, it becomes our duty to see that this foundation is laid broad and deep. By providing an adequate fund for the support of common schools, the legislature discharge but a part, and by far the least difficult part of their duty towards educating the people. They must secure its efficient application to the proper objects. In this respect, there is, in my judgment, a manifest defect in our system. Little as yet has been done to provide teachers properly trained for this pursuit. Without well qualified and skilful instructors, the amplest funds will prove comparatively useless. It is scarcely less important to establish a wise plan of supervision, not so much for the purpose of securing a faithful application of the public monies, as to introduce the most effectual modes of teaching, and the best systems of instruction.

The mere imposition of tasks, which are usually performed as an enforced duty, falls far short of the ends that should be aimed at. Emulation should be awakened in the minds of the pupils, and the acquisition of knowledge made a desirable object. When they once become sensible of the great advantages of education in the ordinary pursuits of life, and of the numerous enjoyments springing from the cultivation of their mental faculties, the difficulties of the work are nearly overcome, and the duties of the government are in a great measure performed. They then become their own teachers, and will seek opportunities, and furnish themselves with means of instruction.

Republican governments are the most deeply interested in the cause of education, and from them it is reasonable to expect vigorous efforts for the general dissemination of knowledge among the people; yet, I regret to see, that in this respect, we fall far behind even some of the monarchies of Europe. Several of the German states, particularly Prussia, are doing much more for the education of the people, than we are. If this state has failed to take the lead in well doing, in the cause of popular education, let it be the first to follow the example of those who have excelled us.

I fear there is too much reason to regret that more zeal is not felt, and greater efforts made, to improve the condition of our primary schools throughout the state; yet there are places where their importance is duly appreciated, and vigorous exertions have been made for their advancement. Justice requires that the example of the city of New York should not be passed with out notice and commendation. This city imposes annually a general tax, which now produces about ninety thousand dollars, for the support of its public free schools. They are under the management of a board instituted by the Common Council, called the Public School Society. This board are careful to select competent teachers, and to cause the schools under their charge to be often visited, and the course of instruction in them to be properly directed and vigilantly supervised by intelligent committees. The school established by "The General Society of Mechanics and Tradesmen," is liberally supported and wisely managed, and reflects great credit on the public spirit and intelligence of that class of citizens. A personal examination of these schools has convinced me that they are well conducted, and induces me to commend them to other parts of the state for their imitation, so far as circumstances will permit.

The results of our system of common schools throughout the state, will be fully presented to you in the report of the Superintendent. Eight hundred and twenty towns and wards, (being the whole number in the state,) have made reports to him for the year 1832. From them it appears that there were then nine thousand one hundred and seven district schools, in which five hundred and twelve thousand four hundred and seventy-five children were instructed. The whole number of children in these districts, between five and sixteen years of age, was five hundred and twenty-two thousand six hundred and eighteen.

The public moneys distributed to the districts, including one

hundred thousand dollars from the common school fund, and eighteen thousand five hundred and ninety three dollars and twenty four cents from local funds, amounted to three hundred and seven thousand seven hundred and thirty three dollars and eight cents; and the inhabitants of the districts raised for the same purpose, three hundred and sixty nine thousand six hundred and ninety-six dollars and thirty-six cents. These sums, amounting to six hundred and seventy-seven thousand four hundred and twenty-nine dollars and forty-four cents, except about sixty thousand dollars expended in New York for school-houses; were paid to teachers for their services. If to this amount were added the other expenses incident to this system, the whole sum expended for the support of common schools in that year, would be about one million one hundred thousand dollars.

The regents of the university distribute annually, from the literature fund, ten thousand dollars to the academies subject to their visitation. The number which partook of this bounty last year, was sixty-five; and the number of students in them was four thousand eight hundred and fifty six, which exceeds that of the previous year by six hundred and sixty eight. There are many other valuable institutions of the kind in the state, which do not participate in the literature fund. We have seven colleges, two of which are devoted to medical instruction. Some of them are firmly established and highly prosperous; the others are struggling with difficulties, for the want of sufficient endowments; but all, I believe, are in an improving condition. As affecting more extensively the general welfare, common schools are justly entitled to the first consideration and the most liberal patronage; yet seminaries of a more elevated rank ought also to be sustained and cherished for many reasons, and for this particularly, that upon them we must, in a great measure, depend for competent teachers of the common schools.

The subjects connected with the business pursuits of our constituents, next claim our notice. Among these, agriculture stands first in the order of nature, as well as in the rank of importance. It contributes so essentially to wealth, that the early writers on political economy regarded it as the only source of wealth. It furnishes the means of human subsistence, and supplies most of the materials for manufactures, and the chief articles for commerce. When the labor of the farmer is bountifully rewarded, all other kinds of industry partake of its success; whatever, therefore, is done by the government for the agricultural interest, redounds to the benefit of every other. There is no occupation which is so diversified in its objects, and requires such various knowledge to conduct it skillfully, as that of agriculture. This knowledge results from experiments in all climates, soils, and seasons, and is consequently to be derived from different countries. It receives large contributions from the mechanic arts, and from the sciences of botany, chemistry and natural philosophy. The patronage of the government can scarcely be directed to a more useful object than furnishing the means of collecting information on this subject, and of spreading it among the agricultural population. A board composed of practical farmers and men of scientific acquirements, would possess great facilities for concentrating this various and scattered information; and the best means of disseminating it among the people, would be afforded by a public institution, under the direction of such a board, where agriculture should be taught as a science, and practically illustrated as an art. The general interest felt for this branch of industry, will recommend it to your favor; and its intimate connection with the permanent prosperity of the state, will make you desirous of contributing to its advancement.

The citizens of this state have invested a large amount of capital in manufacturing establishments. The encouragement which this branch of industry has been most anxious to obtain, a protection against foreign rivalry, and this could be given only by the general government. The policy, as well as the right, of giving it, otherwise than as it incidentally results from the imposition of such duties on imports as are necessary to raise a revenue merely sufficient to support the government, has been contested. This interest has suffered by the frequency of legislation on the subject of the tariff, and by the uncertainty, as to the measure of protection, it would permanently receive. Hopes are now confidently entertained, that the existing laws will remain for some years without material modification. Should such be the case, there is reason to believe that our manufactures will flourish, and soon acquire a permanency which will enable them to withstand foreign competition.

Though commerce and agriculture are the branches of industry which seem to participate most directly in the benefits of our system of internal improvement, yet they are no more favored in this respect, than many kinds of manufactures and the mechanic arts. While our public works have been attended with local advantage, they have contributed, even beyond our anticipations, to the general prosperity of the state.

It was our fortune that the most practicable route for a water communication between the Atlantic ocean and the great western lakes, lay thro' our territory. This advantage was early discovered by the sagacity of the people of the state, and effectually improved by their enterprise. The internal commerce carried on through the Erie canal, aided as it is by the improvement executed by the enterprise and energy of the state of Ohio, has, during the past season, increased to a magnitude which was supposed to be attainable only in its full maturity, and has extended to regions which were conceived to lie beyond its utmost limits. The country around these lakes and along the rivers emptying into them, as well as the valley of the Ohio, quite down to the Mississippi, have been supplied through this channel with some portion of their merchandize. Boats are daily seen passing upon it, freighted with goods destined for the territory of Michigan, the states of Ohio, Indiana, Illinois, Kentucky, Tennessee, and even for Missouri and Alabama. The delightful climate of this western region, the great fertility of its soil, and the numerous conveniences it offers for the enjoyments of human life, are daily becoming better known, and attracting towards it an increasing tide of emigration. No human efforts—no conceivable changes of circumstances, can check its rapid settlement, or put far off the time when it will be the abode of a population of many millions, abounding in wealth, and seeking the comforts and luxuries to which commerce must necessarily administer. Its trade will increase with its wealth and its numbers. If our canals are to be what a wise management cannot fail to make them—the principal channel for this trade—we must calculate its extent, and make them adequate to this object. When our system of internal improvements was commenced, a great part of this fertile region was a wilderness, and scarcely a sail was spread, for the purposes of commerce, on the great western lakes. The advancing steps of settlement have but just passed the borders of what was then a wild domain, and it already abounds in products demanding a market, and inviting an exchange for articles from merchandise from the Atlantic states. Lake Erie now appears like a frequent track in the highway of commercial nations. Its waters

are navigated by twenty steamboats, and one hundred and twenty-eight sloops and schooners.

The shipping on this lake has increased in the three last years, from six to eighteen thousand tons. The tonnage entering the port of Buffalo last year, was more than two hundred thousand; and an hundred thousand passengers are estimated to have left it for the west.

We ought not, however, to flatter ourselves that we shall enjoy what we now possess, and what lies before us, without competition. The western trade is a noble prize, for which several of the Atlantic states are contending with a laudable emulation; and they are making powerful efforts to remove the barriers interposed by nature between them and their object. We look on their exertions with no unfriendly feelings; and we trust that they will view, in a like spirit, our efforts to administer to the wants and to subserve the conveniences of the western country.

It has already become quite evident that the capacity of the Erie canal will not much longer be adequate to the exigency of the business on it. The improvements which will soon be required, are double locks to facilitate the passage of boats, and an enlargement of the canal in its width and depth. These improvements must necessarily be made under great disadvantages. The public interests will not allow of an interruption to the navigation; and a considerable part of the labor must therefore be performed in the winter season. This subject will probably be presented to you in a communication from the officers having the charge of the canal, and it will undoubtedly receive from you the attention its great importance demands.

The extent of business on all canals is increased by the facility of transportation, and a reduction of the expenses. By enlarging the capacity of the Erie canal, the cost of transportation will be diminished. The tolls are considerable part of the expense. This subject has occupied the anxious attention of the Canal Board, during the present year; and some of the beneficial results to which I have alluded, particularly the wide diffusion of the trade into the western and southwestern sections of the union, are justly ascribable to the enlightened views of this board, and the judicious modification of the rates of toll. Previous to opening the canals last season, the tolls were reduced twenty-eight and an half per cent. on most of the products of the country, and fourteen and a quarter per cent. on merchandise. Notwithstanding the reduction, the amount of tolls received on the Erie and Champlain canals during the last season, is one million four hundred and sixty-four thousand and fifty-nine dollars and ninety-eight cents, which is two hundred and thirty-four thousand seven hundred and seventy-six dollars and fifty-one cents more than the receipts of the preceding year. This board have it in contemplation to make a further reduction on merchandise, of twenty-five per cent. on the present rates of toll, before the navigation opens in the spring. This reduction will bring the tolls down nearly to the constitutional limit. It is probable they might be reduced on some articles below that point, if it were practicable without lessening the total amount of revenue.

I deem it proper to mention another subject, which has an important connection with the operations of our canal system, but which belongs essentially to the general interests of commerce. The obstructions in the Hudson river, although they affect more immediately the interests of the people of this state, operate injuriously also, upon the commercial interests of the whole country. The federal government exercises a jurisdiction over this river, so far as the regulation of commerce is concerned. It is not only the medium of internal trade among the states, but is extensively used for the purposes of foreign commerce; and the duty of regulating both, is, by the constitution, committed to Congress. Tho' there is a great diversity of opinion as to the limits of the power possessed by the general government, to expend money on works in aid of commerce, and in some cases intrinsic difficulties exist in determining whether a particular object lies within or beyond its scope, yet I believe there are but very few acquainted with the subject, who would contest the right of that government to appropriate money for the purpose of removing obstructions in the Hudson river; and all who admit the right, and are apprised of the extent of the injury arising from the frequent interruption of the navigation, will at once concede that it is the duty of Congress to effect this object; but the appropriation for this purpose has heretofore been defeated, by being united in the same bill with appropriations for other objects, clearly unconstitutional, in the opinion of many members of Congress; and some who were most anxious for this improvement, were driven to the alternative of either voting against the whole bill, or of violating their obligation to support the constitution, by giving their sanction to what they regarded as the illegal exercise of a power, which, if once established, would certainly be used to withdraw from this state, to a great extent, the advantages she has won by her unaided efforts, & by the expenditure of millions derived solely from her own resources. The passage of the bill containing these appropriations would have formed a precedent for resorting to the treasury of the United States, for funds to execute projects having no pretensions to be ranked among those of a public or national character. I venture to affirm that the people of this state, in order to procure one or two hundred thousand dollars, for what is really a national object, will never depart from a sound construction of the constitution, approved by our wisest statesmen, and consent to a dangerous enlargement of the powers of the general government, which would be used to take from them indirectly many millions. They cherish the federal constitution, and more highly prize the common welfare, which can only be permanently maintained by

a proper exercise of the powers delegated to Congress, than any advantages they might obtain by unwarrantably extending these powers to accommodate their local interests, or by giving their sanction to an illegal application of them to favor the local interests of others.

If the appropriation for improving the Hudson river must be encumbered with others for objects not generally considered within the powers of congress, and its success must abide the event of a struggle to establish a theory of construing the constitution adverse to the salutary doctrines contained in the message of the present Executive on the Maysville road, and since virtually sanctioned by the people of the United States, you ought under these circumstances, to consider whether the interest of your constituents does not require that this improvement should be embraced among our public works.

Two modes of overcoming the difficulties in the navigation of this river have been suggested; the one by excavating the alluvial deposits with machines, or removing them by contracting the channel, and thus increasing the current; the other by constructing a lateral ship-canal, commencing below the bars, and extending to the cities above.

Apprehensions are entertained by many acquainted with this subject, that the removal of these deposits, will afford but a temporary relief, and that natural causes will soon torn others. The ship-canal is considered by them as the most certain, as well as the most economical mode of effecting this improvement. This work is of a different character from any that the state has yet executed. Your will therefore feel the necessity of examining carefully the various plans that have been, or may be, suggested, before making any selection, should you decide in favor of the expediency of the undertaking.

Our first public work of internal improvement was commenced in 1817, and in the course of sixteen years we have completed six canals—the Erie, the Champlain, the Oswego, the Cayuga and Seneca, the Chemung and the Crooked Lake. By means of them, water communications are opened from the Hudson river to the Susquehanna on the south, to the lakes in the interior of the State, and to the inland seas on our northern and western frontiers. The aggregate length of these canals, is five hundred and thirty miles and the amount expended in their construction, is more than eleven and a half millions of dollars. From the commencement of the system, it has been steadily carried forward, without interruption, under wise councils and prudent management.

At the last session of the legislature, another canal, of ninety-five miles in length, was ordered to be constructed, which will involve, as recent examinations seem to indicate, a further expenditure of one million five hundred thousand dollars. Though some of these works were not undertaken so early as those sections of the state most immediately interested in them, desired yet I am disposed to believe we have effected more, by a cautious policy, than would have been done by a less considerate course of proceeding. By attempting too much at once, we might not only have done less, but endangered the entire system.

The splendid success generally ascribed to the whole, is in truth, the result of only a part of our works.—The Chemung and Crooked Lake canals have not been in operation a sufficient time to show the extent of their utility; but it is estimated that they will not equal in productiveness the Cayuga and Seneca, or the Oswego canal, which have not yet ceased to be a burden on the public treasure.

The Commissioners of the Canal Fund estimate the charges above the amount of tolls, for the support of the Chemung canal, for the ensuing year, at thirty thousand eight hundred and thirteen dollars and sixteen cents; and of the Crooked Lake canal, at eight thousand five hundred dollars. These sums, if the estimate should prove correct, must be paid out of the treasury of the state.

The revenue of the Oswego and of the Cayuga and Seneca canals, has considerably augmented during the past season, and if a fair allowance were made for the increase of this on the Erie canal in consequence of the additional business resulting from these canals, their income would probably be equal to the expense of repairs and supervision, and the interest on the debt incurred for their construction.

The amount beyond the income of these canals, paid for their support last year from the treasury, was nineteen thousand five hundred and sixty-five dollars and twenty-seven cents; and the estimate of the amount to be paid for the same purpose the ensuing year, is twenty thousand two hundred and fifteen dollars and thirty-six cents.

I do not allude to these circumstances with the view of questioning the policy of these works subordinate to the Erie Canal, but to justify the considerate movements which have characterized our past legislation, and which I hope to see observed in our future measures on this important subject. I desire not to be understood by this remark as entertaining a wish to withdraw your attention from any of the applications which may be made to you for internal improvement; my wish is, to see the system not only continued, but carried forward, in the best way calculated to diffuse its blessings as widely as practicable. We are favored with a country every where presenting capabilities for improvement, and containing industrious and enterprising inhabitants, who are rapidly developing its resources, and anxious to have their own energies aided by

the patronage of the government in removing the obstacles which intercept their easy access to our great markets.

I am aware that applications will be made to you for the construction of several other works, which I deem it unnecessary to specify, because I have not sufficient information in relation to any of them, to enable me to make particular suggestions which would aid your deliberations. My views relative to the character of works which it is expedient to execute at the public expense, were submitted to your immediate predecessors. Upon further consideration of the subject, I see no reasons for modifying them. The proper application of the principles then stated, will, in my judgment, carry us forward in the progress of improvement as rapidly as sound policy dictates, and in due time will extend our system to all the objects which ought to be embraced in it.

If these views should appear to you too restrictive in their operation, and you should deem it expedient to authorize public works, which, for a series of years after they are finished, will impose an annually increasing charge on the treasury for their support, besides entailing on the State a debt for the original expenditure, you will, I presume, consider it your duty to provide the means for the ultimate payment of these burdens at the same time they are created. This provision can, in my judgment, only be made by a general tax, or by a permanent incumbrance upon the revenue of the Erie and Champlain canals. The injury that would result to the State at large, by resorting to either of these modes to raise funds for such a purpose, would, I think, much more than counterbalance the advantages of any public work which will not pay, after the lapse of many years, the interest on the sum expended for its construction, and the expense of repairs and superintendence.

For most, if not for all, of the proposed works, several routes are suggested; and various opinions are entertained as to the proper points for connecting them with the canals already completed, and with our rivers and the lakes. There are strong considerations to induce you, before authorizing the construction of any work, to have the routes minutely and accurately surveyed, and the proposed points of connection carefully examined by skillful and experienced persons, with a view to ascertain the amount of expenditure it will involve, and its utility when completed. The propriety of such a course is evinced by the fact that casual examinations and partial surveys have in all cases led to very erroneous estimates. All the works that have been completed, were authorized under the confident expectation that they would require a much less sum to construct than they have actually cost. The route of the Chenango canal was repeatedly surveyed, for the purpose of ascertaining accurately the expenditure; but after all the pains taken to arrive at a correct result, the estimates were in some instances 50, and in others 75 per cent. below the sum which the surveys recently made, with a view to its actual construction, indicate as its probable cost.

It would be desirable to distribute impartially to all parts of the state the benefits of internal improvements, but this cannot be done; because all parts do not offer equal facilities and equal advantages for public works. Indulging, as I trust you do, a desire to diffuse these benefits to a reasonable extent, you will consider the various plans that may be presented to you, and test them by the application of the general principles of legislation, which ought to direct your proceedings on this important subject. The disposition you may feel bound to make of them, will, I trust, be generally approved.

I have no doubt you will grant, as good policy requires you should, liberal terms and fair privileges to companies or individuals who may be willing to vest their capital in works for the improvement of the state, or for developing any of its resources.

The great design of internal improvements is to afford to the people generally the means of an easy and expeditious intercourse, and to increase facilities for the transportation of their products and articles of merchandise. While we are intent upon devising and executing magnificent works for attaining these objects, let us not lose sight of those of a humbler character, but of very general interest, essentially contributing to the same end. The heavy burdens annually imposed upon the people for common highways and bridges, are not, it is generally believed, attended with corresponding benefits. The mode of applying the labour assessed and the money raised for this purpose, is conceived to be defective. Without increasing the public expense, much better results might be obtained, by securing greater economy in the expenditures, and a more skillful application of the labour to the objects to be accomplished. The general interest of all classes of our citizens in this subject, will commend it to your favorable notice.

We are apprised, through the medium of the public journals, that numerous applications will be made to you for the increase of banking institutions. Notices for one hundred and five new banks, with capitals amounting to about sixty-six millions of dollars, have already been published, and it is probable that additions will be made to this number. These institutions have a vital connection with the business pursuits of our constituents, by reason of their effects on our citizens in their immediate vicinity, and their influence on the currency of the country. Our business transactions have been so long conducted by means of bank credits, and by the use of a paper currency, that this course has become firmly settled, and, if it were desirable, it would be scarcely possible, to change its direction. Banks are now regarded as necessary establishments, but I cannot believe that they are required to the extent now asked for. So far as the business of the country demands an increase of them, you will feel inclined to add to their number.

Banking privileges, not only as they are granted by this State, but as they exist in almost every country, are a monopoly which ought not certainly to be increased beyond the actual exigencies of the public. Private interest in res-

pect to these institutions, unless it accords with the public demand for them, should not, and I dare presume to say, will not be permitted to influence your action on this subject. All legislation which turns aside from the public good, to administer favors to individuals or classes, is partial and mischievous. Every charter granted on the terms heretofore imposed, confers, in the prosperous condition of the State, a donation on the stockholders, of a sum varying from ten to fifteen per cent. on the capital of the company.

Though I do not impute to the applicants, in any instance, selfishness as their leading motive, yet we should overlook a universal law of human conduct, if we did not suppose that self interest influences its influence in their actions, and exerts its sophistry to mislead their judgments, as to the public necessity for institutions from which they have reason to expect a considerable direct pecuniary benefit. If any means could be devised to cause the stock to go into the hands of those to whom it is distributed, worth only its par value, I think there would be much less solicitude for the increase of banks. Whatever value is given to the stock above the sum paid for it, in consequence of the franchise or peculiar privileges granted to the corporation, may, upon any principles of justice, be withheld from the subscribers and rightfully claimed by the state; and it is a cause of regret, that some provision to effect this object had not long since been adopted.

The increasing pressure upon the legislature for the multiplication of banks, and the constantly recurring contests attending the distribution of stocks, are every day demonstrating the propriety of such a measure. I am ready to admit that there are many plausible, and some weighty objections, to appropriating to the state the enhanced value of the stock of an institution chartered by the legislature. The consideration that former applicants have received advantages which are to be denied to others of equal merit, ought not to prevail against any measure for correcting the abuses resulting from the bestowment of these advantages. If such an objection is valid now, it must be equally so at any future period; and the evils must continue, because they have once existed. One of the most effectual modes which has occurred to me, of withholding from the original owners the premium on bank stock, is by a public sale, and reserving to the State the advance above the par value. To this mode of distribution there are several objections. It would facilitate the concentration of stock in the hands of a few wealthy individuals, and thereby lead to a monied influence unfriendly to the free principles of our government. Besides, a bank, in the vicinity of its stockholders, and these not only numerous, but composed of citizens of various pursuits and different sentiments, will be more certain to fulfil the public designs of such an institution, than one owned by a few individuals, residing perhaps at a distance from it, who would feel less disposed to accommodate local customers, and be more strongly tempted to devote it to personal and private purposes.

If the premiums on the sales of stock were either paid into the treasury for general purposes, or assigned to any of the particular funds, this disposition of them, which would be but the mere incident of a measure to correct existing abuses, might be converted into a principal motive for increasing such institutions. The desire of supplying the wants of an exhausted treasury, or of increasing a favorite fund, might possibly operate as an inducement to grant applications which would not be sustained on the ground of public utility. Combinations, by speculators, at the sale, might also prevent fair competition and engross the stock. These objections, to some extent at least, are admitted; but it is believed their force might be much weakened by wise provisions of law regulating the sales, yet whether sufficiently so to render the measure expedient, is a question for your determination.

The reduction of interest on bank loans has been suggested as a measure that would prevent an undue multiplication of banks, by removing private inducements for charters. Judging from the exorbitant profits on most of these institutions, it would appear that the interest on such loans, might be brought down to, and even below, six per cent, and still the investment of capital in bank stock yield ordinary profits. I much fear, however, that this measure is more specious in theory, than it would be sound in practice. There are many things that laws cannot effectually control, and one of them is the interest of money. If the use of money is worth eight or ten per cent, those who have it to loan will general ly contrive, in spite of legislative enactments, to obtain that rate of interest. The reduction of interest on bank loans, below the general rate, would increase, I apprehend, to a alarming extent, one of the evils to be dreaded from these monopolies. Their tendency is to degenerate into exclusive ly private institutions, conducted on the narrow principles of favoritism. If bank interest was one or two per cent. below the common rate, their loans would generally be made to persons interested in the institutions, and so far as the public at large was accommodated, it would be done by a secondary operation, through the agency of those persons, at or above the common rate of interest. The large profits in which all the stock holders now participate, would be partially withdrawn from them, not however to be more generally diffused, but to be concentrated in a narrower circle. The concentration of benefits would be speedily followed by the concentration of the stock; and the few who would by these means get the management of an institution, would be likely to use it for the purpose of private speculation, or to secure to themselves accommodations for their own business on better terms than their competitors would be able to obtain. If such should be the effect of this measure, the inducement of a private character for the multiplication of banks would be increased, and the public benefits intended to be conferred by them, diminished.

The beneficial effects expected from the proposed reduction, would probably be defeated by changing the mode of doing business at the banks. Instead of loaning money on paper, payable at their own counters, they would use their funds to purchase drafts and bills made payable at other places, at such a discount as would be equal, at least, to the general rate of interest. This operation could not be restrained, nor the rate of discount regulated by law, without essentially impairing the public usefulness of these institutions.

A general reduction of interest on all loans and other contracts, would leave banks with at least the comparative advantage they now possess, and the effects of such a measure upon the general prosperity of the state, are worthy of your profoundest consideration. That the accumulation of capital, as distinguished from bank loans and a surcharged circulation of bank paper, is conducive to our general prosperity, cannot be doubted. It is equally obvious that, bringing down the rate of interest, would, to some extent, diminish the total amount of our capital, or at least

check its introduction into the state. Other parts of the Union, where the rate of interest is below ours, think that in this respect we have advantages over them, and they are making efforts to increase it to our percentage. In prosperous times, abundance of capital enables us to expand our business and develop our resources; and in seasons of embarrassment, it helps us to sustain the public pressure.

But if the stock of such new institutions as you may deem it discreet to grant, must be scrambled for by the subscribers, and go into the hands of the successful competitors, worth considerably more than its par value, much of the bitterness of feeling, ordinarily resulting from these contests, would be prevented, and a combination to get control of these institutions, in some measure, defeated, by appointing commissioners for the distribution of stock, in each case, who reside out of the county wherein the bank is to be located, and who shall be not only disqualified from holding any office in it, but from taking, directly or indirectly, any of the stock, for a limited time after it shall go into operation.

These considerations are worthy of your serious attention; but much less so, than the great questions, how far banking capital can be safely augmented, and what further safeguards are required to secure our banking institutions from disasters, in seasons of great commercial revulsion and general embarrassment. In the course of events, such seasons will come, and the increase of banks may be one of the causes that will contribute to their recurrence; and when they do come, it will certainly be the cause of aggravating the severity of the public distress.

Almost the entire business transactions of this State, and of the whole country, are founded on a gigantic system of credit. This system expands, not only with the increase, but by the continuance of our prosperity. Success emboldens the spirit of enterprise, and men gradually forget the lessons of caution and prudence that adversity teaches, as they recede from the times in which they have received this useful instruction. It is your duty, when called on to extend this system by multiplying banks, to consider well what effect this measure will have upon the stability of the whole. If you enlarge the superstructure, you ought to strengthen the foundation.

It is worthy of your consideration, whether an additional safeguard would not be afforded by a general provision, restricting the circulation, not only of the new banks, but, in due time, of those already incorporated, to the amount of their capital. This restriction, seems to me, to be well calculated to add to the public security, without greatly impairing the ability of these institutions to administer to the public wants. Only the specie in the vaults of the banks, remains necessarily in an unproductive state; the residue of the capital may be profitably employed; together with the privilege of a circulation equal to the whole, and the use of the temporary deposits, will enable them to defray their necessary expenses, and render a liberal return to the stockholders for their investments.

I should extremely regret that the considerations which I have urged for cautious action on this subject, should be construed into a warning against particular impending dangers. I am confident there is, at the present time, no existing cause for alarm. Our system of credit, compared with the immense business of the State, embracing, as it does, the transactions of the principal commercial emporium of the great nation, is not extended beyond the systems of the neighboring States, or those of other commercial countries. Besides all the safeguards provided for banks elsewhere, this State has fortified her institutions with additional securities; by creating a fund to protect bill-holders from ultimate loss; by making it the interest of all to detect the mismanagement and contribute to the safety of each;—and by instituting a visitatorial commission to supervise their operations, with ample powers, not merely to correct but to prevent abuses.

The last four years have been to the people of this State a season of unwarmed prosperity. Within this time there has been none of those commercial alterations which ordinarily happen every few years, except a slight pressure at two years since, occasioned mostly by an unfavorable local operation, at this time, resulting principally from the management to which the Bank of the United States has resorted with a view to obtain a renewal of its charter; but the former of these did not, and it is believed, the latter cannot, put to a severe trial the solidity of our banking institutions.

The legislature, within these four years, added nine millions to our banking capital; and you will be urged at this session to add many millions more. It appears to me that it would be hazardous too much to augment this capital to an unprecedented extent, before we have had the experience of less prosperous times to test the effect of the increase already made. While you feel a desire to contribute, in this respect, to the wants of the various sections of the State, you will, I trust, bear in mind that you are acting on a subject of vital importance to all, in its nature both delicate and difficult—because it relates to a system sustained in a great degree by extensive and mutual confidence—and difficult, because it has numerous and complicated relations to the business pursuits of all classes of our constituents.

The constitution is now so amended as to allow the legislature to reduce the duty on salt manufactured in the western part of this state, to six cents on each bushel; this subject will, therefore, properly occupy your attention. The vote on the amendment of the constitution shows clearly that a reduction is generally expected; but a question may arise as to the amount proper to be made at this time. I think there are sufficient reasons for bringing down the duty at once to the minimum rate. Salt is an article of general consumption, and a diminution of its price is a direct benefit to the consumers. The demand for that manufactured in this State is regulated by the extent of the country to which it furnishes a supply, and this extent will be enlarged as the price is reduced. A regard to the public revenue, as well as to the interest of the manufacturers, requires that the region for consumption should be extended as widely as practicable. The material for the manufacture of this article is so abundant, that the supply may be easily equal to the utmost demand.

Of the salt manufactured by our citizens, large quantities are consumed in the Canadas—it supplies the country around the lakes, the western part of Pennsylvania, and a large portion of the State of Ohio, and enters into competition with the salt made at the Kenilworth springs in Virginia, on the borders of Indiana and Illinois. A reduction of six and one half cents on the bushel will be the means of extending the sphere of consumption far beyond these limits, and the increase in the quantity manufactured, for the purpose of satisfying this additional demand, will ultimately compen-

sate the revenue for the increase in the rate of duty. The mutual interest of the manufacturers and the consumers in this State—the advantages to the business intercourse between our citizens and the north and west, resulting directly and indirectly from our ability to supply these regions with this important and necessary article, and the ultimate effect of this increased demand upon the public revenue, considered in reference to the tolls on the canal, as well as to the direct duty on the salt, render it expedient, in my opinion, to bring the reduction to the lowest constitutional limit.

The militia system was cherished by the patriots who laid the foundation of the general and state governments, as essential to the preservation of our liberties. I regret that efforts have been made to bring it into some disrepute. The unfavorable opinions which now prevail on this important subject, do not arise, I am persuaded from a general conviction that all organization of the kind is useless; but they are to be ascribed to the defects of the present system. These defects can be effectually removed only by Congress.

The joint resolutions of both houses of the last legislature suggesting several modifications of the present laws, have been transacted, agreeably to a direction therein, to our senators and representative, in congress, and also to the governors of the several states, with a request that they might be laid before the respective legislatures thereof. It is reasonable to expect that this subject will occupy the attention of congress, and that the present organization will be so far improved, as to remedy its defects without impairing its efficiency.

By the report of the Adjutant General for the present year, the numerical force of the militia of this state appears to be one hundred and eighty-eight thousand, four hundred and forty-seven men.

The particular funds of the state continue in a prosperous condition. The Canal Fund, notwithstanding the reductions of the tolls, has increased in productiveness. The total amount of receipts during the fiscal year ending on the 30th of September, including the tolls on the Oswego and the Cayuga and Seneca canals, and the interest on the surplus moneys belonging to this fund was one million nine hundred and ten thousand eight hundred and ninety-five dollars and sixty-four cents. The total amount of canal debt is 6,3 millions six hundred and seventy-three thousand and six dollars and twenty-nine cents. The debt created for the construction of the Erie and Champlain canals, was, on the 30th of Sept., five million five hundred and twenty-two thousand six hundred and fifty-nine dollars and twenty-nine cents. To this debt the constitutional pledge of the tolls at a specified rate, and of the auction and salt duties, attaches. During the last year, the commissioners expended one million five hundred and sixty-six thousand three hundred and ten dollars and three cents, in purchasing the stock of this debt. In consequence of the period of redemption being in 1837 and 1845, they were obliged to make purchases at a premium. After making these purchases, they had in treasury on loan, and invested in other stocks, amounting to two millions six hundred and two thousand five hundred and ninety-four dollars and seventy-six cents, belonging to this fund. The actual amount of the debt to which the constitutional pledge is applicable, beyond the means the commissioners possess for redeeming it, is therefore only two millions nine hundred and twenty thousand and sixty-four dollars and fifty-three cents.

If large expenditures are not made for enlarging and improving the Erie and Champlain canals, the commissioners will probably have, before the end of three years, sufficient means for discharging the whole of this debt; yet the pledge must continue, unless all the stock be purchased, until July, 1845. The object of the pledge was to obtain the means of reimbursing the loans made for the construction of these works. When funds are accumulated amply sufficient for this end, there can be no good reason for retaining the pledge. Its continuance beyond that period, will be attended with embarrassments and positive injury. It will prevent such a modification of the tolls, as would best subserve the interests of trade, or as would produce the best result as to revenue. It is intended, as the course of your predecessors for a few years past seems to have indicated, that the canals shall return to the general treasury of the state, some part or the whole of the moneys that have been taken from it for their benefit. It would seem proper to have that matter adjusted as soon as practicable. Should it be judged expedient to make the revenues of the canals subsidiary to the support of the constitution, of other public works of internal improvement—even for this purpose, it would be convenient to have them disencumbered at an early period.—After considering this subject in all its bearings, you will determine whether the interest of the State requires that this pledge should be removed, when sufficient means for paying the loans secured by it, shall have been obtained.—As such a measure will require an amendment of the constitution, which cannot be effected in a shorter period than two years, you are invited to consider it at the present session.

The productive capital of the School Fund is one million seven hundred and fifty-four thousand sixty-six dollars and eighty-four cents, and has increased eleven thousand eight hundred and seventy-one dollars and fifty-six cents, the last year. Its income was, during that year, one hundred and nine thousand one hundred and seventeen dollars and seventy-seven cents.

The capital of the Literature Fund is two hundred fifty-seven thousand nine hundred thirteen dollars and forty-six cents, and it produced an income last year, of twenty two thousand five hundred and seventy seven dollars and twenty-two cents.

I presented to your immediate predecessors the condition of the General Fund, and urged on them the necessity of devising the means of replenishing it. Such a measure seemed to me necessary to enable that fund, not only to defray the ordinary expenses of the government, which amount annually to about three hundred thousand dollars, but to pay such appropriations as it might be deemed expedient to make, for establishing or supporting institutions for objects worthy of public patronage. That duty was deferred, and it now devolves on you. I take the liberty to refer you to my annual message to the legislature last year, for my views on this subject, and to recommend to you to devise and settle a system of finance for the support of the government.

Having discharged the duty imposed on me by the constitution, of communicating to you the condition of the State, and recommending such matters as in my judgment ought to engage your attention, permit me in conclusion to assure you that I shall most cordially co-operate with you in all measures for the common good of our constituents, or for the interest of any portion of them, so far as it is compatible with the welfare of all.

W. L. MARCY.
Albany, Jan. 7, 1834.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads.
No. 264 Elizabeth street, near Bleeker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 85 tr

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscriber at Paterson, or 80 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J 8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

**INSTRUMENTS.****SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.**

EWING & HEARTT, at the sign of the Quadrant, No. 43 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing & Hartt.—As you have asked me to give my opinion of the merits of those Instruments of your Manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

SUPERIOR VEGETABLE AND AGRICULTURAL SEEDS, &c.—The subscribers having devoted a portion of their grounds to testing the excellence of the various Vegetables of foreign climates and also the most select of our own country, now offer to supply vend read others with a most extensive assortment of the finest Esculent Vegetable Seeds: also with Agricultural Seeds, and with those of above 40 varieties of annual and perennial Flowers. The Seeds now offered possess the advantage of being reared under their own direction; or, when imported, of being tested to our satisfaction, and their accuracy and vitality are expressly guaranteed; and among them will be found a large number of highly estimable kinds never before offered to the public. Catalogues will be forwarded to every applicant, and orders sent by mail will meet with the utmost dispatch.

WM. PRINCE & SONS. [J 11]

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed; viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 73 of this Journal.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street,
J 31 & corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street,
Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information: The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rail on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. M. GILL, Civil Engineer.

German town, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
Common and Norristown Railroad.

GRACIE, PRIME & CO. having this day taken into co-partnership JOHN CLARKSON JAY, will continue their business under the same firm.—New-York, 1st October, 1833.

FOR SALE.

ATLANTIC JOURNAL AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Rafinesque, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. dedicated to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 100 plates, containing also the economical properties of 300 genera of American plants. \$3.

MANUAL OF AMERICAN VINES, and Art of Making Wines, with figures. 36 cents.

FISHES AND SHELLS OF THE RIVER OHIO. 1 dollar.

AMERICAN FLORIST, with 36 figures—price 36 cts.

* * Orders for these works, or any other of Professor Rafinesque's, received at this office.

A 91 J M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, {
January 29, 1833. F 14

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered Incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered Incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 60 North 5th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 18, 1833. A 90 tr RM & F

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M^d Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1820, by his savants filed in the Patent Office. Apply, post paid.

81 R J M & F

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as un mindful of safety. Apply, post paid.

81 R J M & F

ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and sowing of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* * Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the
NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JANUARY 18, 1834.

PORTSMOUTH AND ROANOKE RAILROAD.—The Editor acknowledges his obligation to R. H. Bradford, Esq., of Washington City, for a paper containing a report of the chief engineer of this railroad, a part of which will be found at page 24, and the remainder will be given in a future number of the Journal. The prospects of this road may, we think, be considered very fair; the more so at this moment, on account of the disposition exhibited in the Virginia Legislature, by the passage in the House of Delegates of a bill authorizing a subscription by the State for two-fifths of the stock of the company. The completion of the Roanoke and Portsmouth railroad will be of immense benefit to the whole Roanoke country, as well as to the ancient city of Norfolk. Lands which have for years been of no value, or of so little value as to remain uncultivated, will be again brought into use. The construction of railroads, intersecting the various parts of Virginia and North Carolina, will have a tendency to check emigration, and of course to re-establish a different and more gratifying state of things in those States.

In acknowledging our indebtedness to the numerous friends of the Journal for past favors, to which it is mainly indebted for its present standing, the Editor cannot refrain from soliciting, and even urging, a continuance of the same kind feeling which has enabled him thus far to contribute to the extension of information calculated in a high degree to promote the prosperity of the country. With a continuance of their aid, and an increased exertion on his part, he hopes to be able to diffuse, more widely

than heretofore, such information as will promote the convenience and happiness of the mass of his countrymen.

ITHACA AND OWEGO RAILROAD.—In a recent excursion westward, we had an opportunity of passing over and examining a part of this road. From a previous hasty perusal of the report of its able engineer, we were led to entertain a favorable opinion of the mode of construction adopted by him—and a personal examination, we are much gratified to say, enables us to speak in high terms of that part from the foot of the inclined plane to its termination at the inlet, which is now completed. The curve of this part of the road is upon a radius of 2,434 feet, which may be considered an easy one for the use of locomotive power. The ascent from the wharf to the foot of the inclined plane, a distance of 5,366 feet, is at the rate of $7\frac{3}{16}$ ft per mile. The rails are laid along and parallel to the inlet, at a distance sufficient to allow of a range of large storehouses between it and the water, so that goods may be taken in from the cars at one end, and from boats at the other. In forming the embankment for this part of the road, a channel for the stream or canal has been dug, which confines its waters within certain bounds, therefore does away, or remedies, a serious inconvenience, under which the place has sometimes labored, in consequence of its overflowing its banks. It will also, with a small additional expense, enable boats to come quite up into the village.

That part of the road, however, between the inlet and the foot of the inclined plane, loses, comparatively, its interest when you approach and ascend the inclined plane. This plane, probably, attains a greater elevation in the same distance, than any other in the world. It rises 1 in $4\frac{3}{16}$, or 405 feet in 1,733. It commences a short distance from the base of the hill with a high embankment, but soon finds a resting on a firmer basis—the solid rock—a considerable excavation of which is carried near to the summit, and upon which rails of the most permanent kind, being of white oak, 12 inches square, secured in the best manner to the rock beneath, are laid. At a distance of 1733 feet, and an elevation of 405, from the base of

the plane, stands the engine-house for stationary power, into the second story of which the plane is carried, in order to attain, in the shortest possible distance, the greatest practicable elevation; directly at the south end of this building, and at an elevation of over 20 feet, the railroad crosses the Owego turnpike, and continues gradually to ascend for about seven miles, to the summit level; after which, it descends gradually to the Susquehannah, at Owego. At first view, it will probably appear that so bold an ascent is injudicious—yet, on reflection, it will be conceded, we think, that, with a powerful stationary engine, and a plane of uniform grade, the ascent of 404 feet may as well be overcome in five as in ten thousand feet.

The second inclined plane commences a short distance from the head of the first, but its ascent is only as 1 in 21, or 106 in 2,225 feet: thus overcoming, in the distance of 3,959.3 feet, an elevation of 511 feet. The greatest part of it, however, or 405 feet elevation, is attained within the space of 1,733—which is probably a greater elevation than is attained on any other Railroad within the same distance.

Doubts are entertained by some of the policy of the measure, as they apprehend danger in descending. There will be danger, undoubtedly, unless the machinery is appropriate to the occasion; but with such machinery,—and we were informed that Mr. Randall had also invented a safety-apparatus, which will prevent damage, even if the rope were to break,—we entertain no doubts of the complete success of the plane. It will be a curiosity in the history of Railroads.

With a water communication on one side, and a railroad on the other, which will ere long be continued to this city, Ithaca, with her immense water power, which is said to be equal to the power of 30,000 horses, must become not only one of the most flourishing, but also one of the greatest manufacturing towns in the state.

The extreme cold weather, and other engagements, prevented an examination of the line; but we were informed that a section of about 13 miles is to be completed and in use early in the spring. It will not long continue, we trust, an isolated road, but soon be continued, or rather connected, with one which will extend from the Hudson to Lake Erie.

Mr. Burden's New Steamboat. By G. [Communicated for the American Railroad Journal.]

It is interesting to observe, as we sometimes may, how nearly the extremes of the perfection of science, and the early rude essays of art, approximate each other; how often, when the efforts of genius, after long and painful study and experiment, have produced a work which excites wonder and admiration. We may find among some of the earliest and rudest specimens of savage or untutored art, an example of the successful application of the principle by men whose minds were never admitted even to the vestibule of the science, and which has existed in the view of half the world for ages, without ever having been known to arrest the eye of science with reference to the particular principle sought for.

I was led to this remark by the notice I have seen in the Journal, of Mr. Burden's new invented steamboat, the principle of which seems to be so far in advance of all others heretofore known, that perhaps we might conclude that attempts so further improvements would be vain. It is indeed, so far as I can judge from the descriptions I have yet seen, a highly important improvement, and Mr. Burden deserves much credit for his sagacity, enterprise, and perseverance. And the remark with which this article is introduced was far from being designed to detract from the merits of the invention, or the credit of the inventor. It was intended rather to excite attention to the fact, that a careful observation of many of the earliest essays of art may be useful in any endeavors still further to improve this important department of naval architecture, as well in assisting the researches of science on other subjects.

Of the various elements which enter into the composition of the most perfect specimens of naval architecture, some are, in a degree, incompatible with others. Thus, of the respective forms of construction best adapted for speed, burthen, safety, strength, or power of control, severally, no one can be exclusively given, in its utmost extent, without destroying or essentially impairing the usefulness of the vessel in respect to some other requisite properties.

Since the introduction and extension of railway conveyance has appeared to threaten almost to supersede the use of canals, particularly in cases where speed of transportation was an essential object, the attention of a portion of the community has been directed to the question, whether the supposed limit to the speed of canal boats, occasioned by the accumulated resistance of the water in proportion to the increased velocity of the boat, might not be overcome. The laws of matter and motion, however, were confidently supposed to preclude the possibility of success, to any degree which should approach to the velocity already attained on railways, (unless perhaps at an expense of motive power greater than would be justifiable in practice.) But experiments were instituted in Great Britain, which soon determined that a speed of at least 15 miles per hour was attainable by a canal boat, with the power of a single horse. (I refer here to experiments on the Ardrossan, and on the Forth and Clyde canals, in 1830.) Later experiments may have produced still higher results, but I do not recollect to have seen any accounts of such. Mr. Burden's experiment, however, seems, so far as we can judge at present, to establish the fact that, by the power of steam, any desirable degree of velocity may be obtain-

ed on smooth water, as easily as on land. The disparity, therefore, between railway and canal transportations, so far as velocity is concerned, appears by this to be immensely diminished, if not perhaps annihilated; and modern science will glory over ignorant antiquity, in the discovery that the resisting power of water is no longer an insuperable impediment to the swiftness of conveyance over its surface.

But, let us pause. Making certain degrees of allowance for the facility rendered by the more or less gradual and smooth outline of the curves forming the stem and stern of the boat, the power necessary to propel a vessel through the water is not so much proportioned to the absolute weight of the boat, or the quantity of water it displaces, as to the superficial measure of the greatest transverse section of that part of the boat which is immersed in the water. This principle has long been applied to practice in the construction of boats used to ascend our rapid rivers with heavy loads. These have been made as narrow as they would bear without upsetting, or becoming too unsteady for safety; and as long as they would bear without breaking, when they happened to be aground; perfectly straight on the floor, with as long a rake, fore and aft, as was consistent with convenient management. They were so constructed from the observation of facts, obvious to the eye of the practical boatman, without reference to recondite principles of physical science, because they knew no more of those principles than their effect on the subject matter of their daily occupations. Yet they gained one of the points long sought by science. They transported their loads, ascending against the smooth rapid currents of our rivers, with the least possible expenditure of muscular power, which was the only power then employed; and this point was all they sought. But there were other points not attained in this simple construction. The long flat bottom, and strait "wall sides," were well adapted to easy motion in a direct line forward, in perfectly smooth water, but to move in a curve line was not so easy, and to double a short point, or follow the sinuosities of some of the rivers and streams, without constantly chafing against the banks, would require more power to be exerted laterally, than would be requisite for the direct propulsion of the boat in the strongest current. To navigate, also, in rough water, the long low-sided boat was unfit. The short waves, not sufficiently broad and gradual to bear up the whole boat, were yet sufficiently high to break over its sides, and fill and sink it.

Mr. Burden's improvement remedies both these disadvantages. The curves of the bottom, as well as the sides of his boat, facilitate the steering, and place it under the control of the helm. His tight deck, (for so that part of his boat which lies out of the water may be termed,) prevents the filling and sinking of the boat in rough water; though, perhaps, something of its speed in a direct line and smooth water may be sacrificed by the greater transverse section of the bilge. But in a minor consideration, compared with its other advantages. The great length, compared with its small transverse section, gives the advantage of increasing the tonnage without increasing the direct resistance to its speed; and the arched form of the whole gives it all the strength which is consistent with other indispensable properties.

But, the example of the river-boats, which I have cited, is not the only instance of the successful application in practice of principles unknown in theory (unless the practical observations of the untutored savage may be said to be scientific theory in another form). I have, many years ago, with emotions of surprise and pleasure, watched the rapid gliding of the long, slender, curvilinear forms of the cedar canoes of the Indians navigating the waters of the Oronoke—the apparent ease with which they propelled them with their light paddles—the velocity of their direct movements, and the graceful ease of their steering. With similar feelings I have seen

and navigated the light birch bark canoe of the Indians of the Penobscot. Their speed—ease of propulsion—facility of evolutions—safety, in skilful, yet, fragility and danger in unskilful, hands—have long been a theme of admiration to those to whom familiarity has not rendered the sight indifferent. These, with those of the Oronoke, and other parts of the south, and, as far as I can judge from the descriptions I have seen, the astonishingly swift pirogues of the South Sea Islanders, are all actually formed at and below their water-line, substantially on the principle of Mr. Burden's parabolic spindle! The savage fashions his rude back in the form which the experience of his forefathers has taught him was best adapted to obtain the ends desired—speed, safety, and ease of evolution, so far as circumstances would admit of their combination. But one thing more was wanting. The least possible width to the boat was necessary to diminish the resistance of the water to its rapid flight; but this rendered it too liable to be upset. To remedy this, the "outrigger," and the "double-canoe" of the South Seas, appear. These perhaps may have afforded the hint for the "twin boat," introduced but few years ago on the Forth and Clyde canal—and now to the latter succeeds, on the same radical principle, the "twin parabolic spindle raft" (if I may be allowed to coin the appellation) of Mr. Burden.

It is yet to be ascertained whether Mr. Burden's boat will prove as valuable an improvement in navigating the ocean, as it appears to be in the mode of river and canal navigation. Its "tight deck" gives it, in some respects, the advantage over its partial prototype, the Indian canoe; but, for some purposes, the form of the latter may be preferred. It may, also, at present be doubted, whether the extreme length of the projecting part of the "spindle," level with the surface of the water, may not, in ocean navigation, expose it so much to the power of the waves, as to impede its motion and endanger its safety, more than sufficient to counterbalance its other advantages. But this is only the precautionary suggestion of ignorance; and I would not, by any means, utter it to damp the ardor of inventive improvement, or diminish the credit due to the experiment thus far. Mr. Burden will doubtless be stimulated by his present success, to study still farther improvements; and will not, I am sure, impute the observations I have made to any unfriendly spirit. They are made on the spur of the moment, under the influence of real pleasure at the announcement I have just seen of his experiment, and a disposition to contribute my mite towards bringing to view any such facts in the history of the arts as may afford any lessons or hints useful to the cause of general improvement. The facts I have alluded to prove, at least, that one part of Mr. Burden's principle—the form of his boat below the water-line—is a sound one—that it has stood the test of long experiment. With respect to the other part—the unity of the whole to prevent the dangers, in rough water, of almost constant submersion—perhaps the "kajak" of the Greenlanders may afford an analogy of some importance. So that, on the whole, should Mr. Burden's first experiment fail, or come short of complete success, he will have the support of long-tried facts to sustain him in asserting the soundness of the principles; and need only to direct his attention to such improvements as may be necessary in the details, to make his invention complete in all respects. Every American—indeed, every friend to the success of rightly-directed enterprise and the improvement of the condition of man—must cordially wish him success.

G.

STEAMBOAT NEW ENGLAND.—We are induced to insert the annexed testimony of the witnesses examined respecting the bursting of the boilers of the New England, notwithstanding its length, on account of the importance of the general subject to which it relates, the

melancholy interest connected with the case immediately under consideration, and the high scientific reputation of the gentlemen composing the Board of Examiners. Public opinion had assigned a *deficiency of water* as the cause of the explosion; but the Committee, after the most careful investigation, are unanimous in the belief that it was "the pressure of steam produced in the ordinary way, but accumulated to a degree of tension which the boilers were unable to sustain."

Alexander Marshall, Engineer.—Was engineer of the Steamboat New England, on the 8th October last. Left New-York a few minutes after 4, P. M., on that day, with a light pressure of steam. The engine having been started cold, the steam did not increase till we had proceeded as far as Hurlgate.

The average pressure used on the passage was from 10 to 12 inches. The steam rose after starting from 8 to 14 or 16 inches. At 7, P. M., left the engine in charge of Mr. Younger, the assistant engineer, and retired to rest with a view of taking his watch at 10 P. M. Was called by Mr. Younger at 10 o'clock. There was a heavy sea in the sound, and, in consequence of orders which Capt. Waterman had given, the steam was reduced to 8 or 9 inches. Was obliged to stop before arriving in the river by order of the pilot, in order to adjust the wheelrope. Arrived in the river about 1 o'clock A. M. Missed the wharf at Saybrook, and after a second attempt to gain the wharf, some difficulty occurred with the lifting valves, in consequence of the binders by which they are confined being screwed too tight, which made it necessary to anchor. After loosening the valve rods, the boat got under way, and landed at Saybrook. Landed also at Lyme. Just before landing at Essex, went into fire-room and examined the gauge-cocks (water-cocks,) and found the water good in the boilers. This was three or four minutes previous to the explosion. The boat was stopped about two minutes at Essex to land a passenger, with the small boat. Took hold of the pulley of the safety valve for the purpose of raising it, and at this moment the explosion took place. Does not know whether he had lifted the valve or not.

Being further examined, he says, that the steam-gauge did not exceed 14 inches while in the Sound nor 10 inches after entering the river. This statement is not founded on actual measurement. There was no scale of inches marked to either of the steam gauges. Refers only to the height of his own gauge in the engine room. Is aware that the steam-gauges in the two fire-rooms ranged considerably higher. Ascribes the difference to the greater expansion of the mercury in the fire-rooms, from the proximity to the fire. Had a greater pressure of steam immediately previous to the explosion than was proper to use in the river, where the boat does not steer well under a strong power, and this was the reason why witness attempted to raise the safety valve.

Witness further says, that the New England commenced her first trip on the 30th August last, under the charge of witness as engineer, he having been employed to set up the engine. The charge of the engine was afterwards given to Mr. Potter, the engineer of the company who owned the boat.

Witness again took charge of the engine on the trip previous to that on which the accident occurred, in consequence of the illness of Mr. Potter. Witness was employed as engineer of a steamboat at the South, 12 years ago, which boat was run by him during the season of navigation. Says that his management on the night of the accident was not at any time influenced by a desire to shorten the passage. Heard no inquiry made by any of the passengers about racing. The only fuel used by him in the New England was pine wood. Witness has been

20 years engaged in his present business. Has served a regular apprenticeship in the manufacture of engines. Has been employed in New-York by Mr. McQueen, Mr. Allaire, Mr. Sabbatton, and the West Point Foundry Association.

The safety valve of the New England was loaded 18 pounds in the square inch, and its position on the steam pipe is 20 feet, or more, from the boilers. Besides two regular weights on the safety valve, there were two extra weights, a 50, and a 23. The valve will blow off at 8 pounds to the square inch, with the two regular weights. This is owing to the lever of the safety valve having been shortened about 2 feet, to bring it within the walls of the room by which it is enclosed. The diameter of the safety valve is 10½ inches. The diameter of the steam pipes which lead from the boiler is about 10 inches.

Robert Younger, Assistant Engineer.—Witness started from New-York at a few minutes past 4 o'clock, P. M., as assistant to Marshall. At 7, P. M., Marshall left the engine in charge of witness. About half past 8, Capt. Waterman came to the engine-room and asked if the engine did not labor too much in the sea. Also inquired the height of the steam-gauge; was answered 10 inches. Capt. Waterman requested him not to carry any more. Witness then blew off steam, and went to the fire-room and gave directions for less fire. Run with steam from 8 to 10 inches, till Mr. Marshall came on deck at 10 o'clock. Witness examined the water in the boilers frequently on the passage. Did not see the height of the steam-gauge for the last 10 or 15 minutes previous to the explosion, because his view of the gauge while standing at his post in the engine-room was obstructed by an appendage to the steam-pipe. There was no difficulty occurred in the management of the water in the boilers. One of the boilers foamed once while Mr. Marshall was below. This was immediately stopped by putting oil into the force pump. The steam was blown off at Saybrook while lying to for the purpose of loosening the binders of the lifting rods. This was before landing at Saybrook Point. The position of the bulk-head did not prevent the raising of the safety valve. Witness saw the moveable part of the bulk-head in its proper place on the morning after the accident. Is certain of this from his own personal examination. Has never witnessed an accident of this kind before. Has been 12 years engaged in the business of making engines. Made his first trip as an acting engineer in the New England when the boat was first started. Assisted Marshall in fitting up the engine. Thinks that there was no want of water above the flues, but is of opinion that the steam had blown the water from the legs of the boilers.

William Vail, Pilot.—Says that the New England left New-York at 12 minutes past 4 P. M. in company with the steamboat General Jackson. The steamboat Boston left the wharf soon after the New England. The Boston gained upon the New England till they reached Hurlgate. The New-England then got more steam on, and drew away from the Boston. Found a heavy sea in the Sound, after passing Sand's Point, and the Boston then preserved her distance. The New England steers very badly. After passing Falkner's Island, the wheelrope got foul, and detained us a few minutes, and the boat fell into the trough of the sea. Off Killingworth, and again off Duck Island, the same detention occurred. When off Cornfield Point, (Saybrook,) witness told the engineer that the boat would not steer in the dark with such a heavy sea, and told him not to carry over seven inches, and repeated the same direction to the engineer when in the river. When crossing the bar at the mouth of Connecticut river, the boat steered very bad, and was obliged to ring the bell to shut off the steam. Missed the dock twice at Saybrook, in consequence of no person being on the dock

to take a line. Backed down to near the Fort, where, owing to some difficulty with the valves, the boat could not be started ahead, and was obliged to anchor to prevent drifting on shore. Went into the engine-room and waited twenty minutes for the engineer to get ready for a start. Looked into the fire-room and asked if the water was plenty in the boilers, and was answered 'yes.' Got up the anchor and landed at Saybrook. Started again from Saybrook, and was obliged again to order the steam shut off, because it was difficult to steer the boat. Landed at Lyme, and on starting again, found that the boat jumped so with a head of steam, and steered so badly, that it was necessary to shut off the steam again, and continued shut off till we reached Essex, seven miles from Saybrook. Was detained three or four minutes in landing at Essex. When the small boat had landed, Capt. Waterman gave the word, and witness rung the bell to start the engine, and the explosion immediately followed.

The steam was not blown off at Essex. Witness thought at the time that there was too much steam on. Heard but one explosion, which was like a heavy fall or crash. Had been pilot of the New England for 30 days, which was nearly as long as the boat had run. The accident occurred an instant after ringing the bell to go ahead. Witness had felt apprehensions for his personal safety, on account of the pressure of steam which was carried; judged of this by the motion of the engine and the management of the boat. Saw at Saybrook, the steam-gauge standing at 12 or 14 inches, and cautioned the fireman against carrying too much steam. The stop at Essex was no longer than 3 or 4 minutes.

The greatest distance gained of the Boston was about two miles and a half, which was near the head of the Sound. The Boston was nearly abreast when we entered the river. Witness is unable to make up his mind as to the cause of the accident, but thinks that the rent commenced in the legs of the boiler near the after end.

Giles Farnham, Fireman.—This witness was on duty at the larboard boiler. Took the first watch from New-York, and went below at 8 o'clock. Took his second watch after 12 o'clock, just before the boat entered the river. There were but 8 or 10 inches steam on the boiler before the boat arrived at Saybrook. The steam-gauge rose to 12 or 13 inches while lying at anchor at that place. Blew off the steam to 7 inches, and pumped water by hand into the larboard boiler. Witness says the water was lower in the boiler at this time than at any other, being at the 2d cock. The other boiler needed no supply. Witness examined the water every five minutes. Started from Saybrook with water at three cocks, and kept it afterwards at four cocks till the time of the accident. Above Lyme there was more steam on than there ought to be for the river. The floating stick in the steam-gauge in the larboard furnace was within two inches of the upper or boiler deck, when the boat stopped at Essex, and witness supposes it must have reached the deck previous to the accident.

While the boat was stopped at Essex, tried the water-cocks, and found the water as high as the upper cock. The witness then went over to the starboard fire-room, and told Bell, the other fireman on duty, that "he would not have to fire up again for a week if they went on so." Had but a moderate fire at this time in the furnace. Says, the extra pressure was owing to the engine being shut off so much. At the moment of the explosion witness was sitting on the rail of the fire-room gangway, at the outside of the guard, conversing with Bell, the other fireman. Witness heard a sudden cracking of the boiler, and attempted to look round to see what was the matter, which was the last he knew till he found himself in the water. Was severely scalded, but succeeded in swimming to the shore. Witness says that when there was no steam on the boiler, the top

of his gauge-rod was so short as to fall three inches below the top of the muzzle of the steam-gauge, and therefore did not indicate so much pressure as the gauge of the other boiler, that is, did not indicate the whole amount of pressure by three inches.

Edwin Bell, Fireman.—Was in charge of the starboard boiler at the time of the accident. Left New-York with seven inches steam, and carried about the same pressure till through Hurlgate, after which carried 12 or 13 inches till dark.

Was then directed by Mr. Younger to keep 8 or 9 inches, which was done till 8 o'clock, when witness took his watch below. Came on duty, and took the fire again at Saybrook. At which time there were 8 or 9 inches of steam on, and the fire was run down. Capt. Waterman came and asked witness about the water. Examined and found three full cocks. Witness had no occasion to supply his boiler by the hand-pump. At Lyme, the steam-gauge was at 12 or 13 inches, and on reaching Essex, the gauge-rod was within 3 or 4 inches of the upper deck.

When the boat stopped it soon rose to the deck. Witness then turned off the condensed water from the steam-gauge, which caused it to fall about two inches, but it soon rose as high as before. Tried the water-cocks, and found good solid water at three lower cocks, and steam and water at the upper cock. Went over to the larboard boiler when first we stopped at Essex, and found 3 cocks of good water, and the gauge-rod three or four inches from the deck. The gauge-rod of the starboard boiler usually stood higher than the one in the larboard fire-room.

Witness never saw the float rods of the steam-gauges so high as at this time. Has run in the boat from her first trip. Witness told Giles (Farnham,) when the latter came into his room, "that they would not have to fire up more than once more during the whole watch."

There was a light fire kept up between Lyme and Essex. Witness heard no steam blowing off at Essex. The accident happened about 3 o'clock in the morning. The New England came out from New-York before the Boston. At 8 o'clock the Boston was about two miles astern.

Isaac Seymour, Mate.—Agrees in the statements made by Mr. Vail. In the Sound, from Sands' Point to Matinecock Point, the steam stood at the pressure about 8 inches, and Mr. Marshall was sometime blowing off. Marshall said that it was made faster than he wanted it, and he should speak to the firemen. Thinks there were 10 or 12 inches on the gauge in the engine-room, at the time when the boat was anchored at Saybrook, and they commenced blowing off. Saw the water tried in the boilers at Saybrook, which showed plenty. The larboard boiler was then pumped into by hand.

Perceived no difficulty in working the boat, except at Saybrook. Was not apprehensive of any accident. Was employed in landing with the small boat at Essex. Saw Mr. Marshall visit the fire-room just before the landing at Essex. Witness was facing the dock when he first heard a cracking noise, and was in the act of turning towards the steamboat when the explosion instantly followed.

The larboard boiler, which was nearest to witness, exploded a little before the other. Could just perceive the difference.

Roswell Potter, Engineer.—Witness has run the New England as engineer since she first commenced running, except the first and last trip, when he stayed back on account of ill health. Had no reason to expect that any thing would go wrong. Usually carries from 14 to 17 inches of steam on the boilers of the New England. The engine is intended for carrying 16 to 18 inches. Safety valve, as loaded at the time of the accident, would begin to blow off at 18 inches. Had three steam-

gauges, which would rise from 31 to 32 inches without blowing out the mercury. Steam-gauges of this length are now used in the steam-boats. The gauges in the fire-rooms would stand $3\frac{1}{2}$ inches higher than the engineer's gauge in the engine-room; supposes this to be owing to the loss of heat from the steam in passing through the steam-pipe. Has run with Capt. Bunker to New-Haven, with steam at 8 inches. This was several years ago. Boilers are now made stronger than those which were formerly used.

The extreme of safe pressure on the boilers of the New England he thinks to be 22 to 24 inches. The boat would not sail faster with this pressure than with 17 inches. Has had 24 inches on the boilers; once, when the boat was on trial, and at other times since. This was occasioned by stopping the engine. Has not seen the gauge rods rise as high as the boiler deck in any case. Witness examined the steam-gauge in the engine-room after the accident, and found it in perfect order, with the mercury remaining in the gauge. Also, found mercury in one of the fire-room gauges, both of which were torn down by the explosion. The height of the gauge rod, when up to the deck in the fire-room, would be 28 inches. After turning off the condensed water from above the mercury, we get the true gauge. Has not known any racing with the New England, except with the steamboat Providence, on which occasion had bad wood, and could get a pressure of but $11\frac{1}{2}$ inches. The engineer must stand constantly at the engine to attend to the orders of the pilot. Was engineer of the steamboat Oliver Ellsworth for several years, and usually carried from 12 to 14 inches of steam on the boiler of that boat. The Oliver Ellsworth has the strongest boiler. The latter is made of stouter copper than those of the New England, is $9\frac{1}{2}$ feet in diameter by $16\frac{1}{2}$ feet in length, and is stronger braced than any boiler the witness has ever seen. The engine of the New England is nearly four times the power of that of the Oliver Ellsworth. Thinks that the middle legs of the boilers were heated, and that they now appear to be annealed, and different from the outside of the boiler. The force pumps of the New England are very large, and will fill the boilers running over full from Saybrook to Essex. The New England will steer well with 8 or 10 inches steam in smooth water. The Oliver Ellsworth formerly carried from 12 to 14 inches, and now carries 16 to 18 inches. The McDonough carries 12 to 14 inches. On being further examined, witness says that one of the boilers of the New England was patched twice on the middle leg at the after end, and that a similar patch was put upon the same part of the other boiler. There was a crack in the flange at this point, which made it leak, but these repairs did not stop it. This was the trip previous to the accident. The safety valve would commence blowing off at 18 inches, but had carried 24 inches with the same weights, with the steam blowing through the valve. The boilers had not been proved above 24 inches. Had found the brace-bolts between the top of the furnace and the connection of the flues to the steam chimney, to be leaky, owing to a straitening in the angle of the braces. Had taken them out, and put strait screw bolts in their stead. This was on the second trip which the boat made. Considers the engine to be of 120 horse power.

Adam Hall, Engineer.—Witness is chief engineer of the establishment of the West Point Foundry Association. Made the engine and boilers of the New England. The boilers were 8 feet 4 inches wide, 8 feet high, and about 15 feet long. Each boiler had two arched flues and five circular return flues of 16 inches in diameter.

The arches were made of rolled copper, No. 3, wire gauge, the outer shell of No. 4, and the circular flues of No. 5. The boilers were placed one on each guard of the steamboat, at the

distance of about 25 feet from the engine. The boilers were strongly braced with $\frac{3}{4}$ inch bolts through the legs or flat sides, at the distance of 9 inches, and the arches were secured to the upper parts of the boiler by long bolts of $\frac{3}{4}$ inch copper, with screw fastenings. The steam-pipes were also of copper 10 or $10\frac{1}{4}$ inches in diameter, and the safety valve was of the diameter of $10\frac{1}{4}$ inches. The latter was calculated to blow off at a pressure of 20 inches; but the lever was afterwards shortened to about two feet, and new weights added, after the boat commenced running. There were four water cocks on each boiler, for ascertaining the height of the water.

The lowest of these cocks was three inches above the highest part of the upper flues, and each successive cock was placed three inches higher than the preceding one, the upper cock being twelve inches above the flues. Witness had proved the boilers. Thinks that the boilers should have borne fifty pounds to the square inch, if there had been no previous imperfection. The strength of copper, as compared with iron, is nearly as 3 to 5. The difference witness says is 60 per cent. in favor of iron. Copper has been preferred as a material for boilers, because it suffers less from corrosion. Copper is weakened by the action of heat at about 250 degrees. The strength of iron is increased when exposed to heat up to a certain point of temperature. A copper boiler will bear a greater pressure when cold than when heated. An iron boiler, if not heated beyond 450, will bear a greater pressure than when cold. Has tried experiments with Mr. Stevens on a flat iron boiler, braced at distances of 8 inches, with $\frac{3}{4}$ inch brace bolts, at distances of 6 inches with $\frac{3}{4}$ bolts, and at 5 inches with $\frac{1}{2}$ inch bolts. One of the $\frac{3}{4}$ bolts broke at 756 pounds to the square inch. Three of the $\frac{1}{2}$ bolts gave way at 256 pounds to the inch, and $\frac{1}{4}$ inch braces stood this pressure without injury. The power was applied by a water press, the safety valve being carefully loaded with an addition of 10 pounds at each trial. Witness thinks, from the appearance of the metal, that the rent of the boilers must have commenced in the arches near their connection with the after end. Knows Alexander Marshall, and would have no hesitation in trusting him with the care of an engine in any case. Witness employed him to take charge of a high pressure engine last winter.

Henry Waterman, Jr., Captain of the New England.—Left New-York without working the engine warm, and run the steam down to 4 or 5 inches. The Boston left soon after us, and came up strong till we got through the gate. Then got on 10 or 12 inches of steam and drew away from the Boston. Might be $1\frac{1}{2}$ or 2 miles ahead at $7\frac{1}{2}$ to 8 o'clock. At this time felt a little alarmed for the laboring of the engine in the heavy sea with 12 or 15 inches. Usually works 14 or 18 inches when in full speed. Was often in the fire-room, till half past 10, when he retired. Below Falkner's Island, the wheelrope got foul, which brought him on deck, the boat being in the trough of the sea. Crossed the bar, and got into the river at 1 o'clock, it being low water. Made two attempts to land at Saybrook, and failed, owing to there being no one to fasten a line on shore. Anchored in consequence of a difficulty in moving the valve rods, and blew off the steam. Observed the fireman pumping up one of the boilers, and ordered others to assist him. When the engineer was ready, got under way immediately, and went to the wharf. Heard no complaint of the boat behaving worse than common. Saw nothing unusual or alarming. Carried less steam in the sound than usual, on account of the heavy sea. Should have carried from 12 to 18 inches had the water been smooth. Had a favorable passage excepting the heavy sea. Did not notice the state of the steam after leaving Saybrook. Had no apprehension, or fears of any kind at the time, and had heard none expressed by the passengers,

or other persons on board. Had full confidence in the perfection and strength of the boilers and machinery. This confidence was derived from the experience we had already had. Witness has been five years in the steamboat business, and has had charge of a boat for the last 3 years. Was making no unusual exertions to reach Hartford early, and felt no inducement to such a course.

Has accidentally fallen in company with other steamboats since he has run the New England, and had not been able to keep as much steam while so in company as was desirable, the boilers being too small for the engine, and could not, on an average, in these cases, keep more than 13 inches. Six persons were blown overboard by the explosion, of whom two were drowned. Witness is not able to form an opinion as to the immediate cause of the accident.

Mr. Samuel M. Hayden.—The witness lives at Essex, about 25 rods from the spot where the disasters occurred. Heard the steam when the New England arrived at Essex, the noise of which continued while the boat was landing. Witness doubts if it was three minutes from the time he first heard the steam, till the explosion took place.

His first knowledge of the arrival of the steamboat was from hearing the steam. There were two distinct explosions, following very closely, and "lapping on to each other." The last explosion appeared to be the sharpest.

Fifteen persons have died, including those whose bodies were found in the river.

Such is the evidence which was submitted to our consideration. It was also testified by one of the firemen, that the damper, by means of which the fire is held in check, was not closed during the stop at Essex, a fact which has not been recorded in its proper place. We consider it a remarkable fact, as well as an important circumstance in respect to the success of our investigation, that we have been able to obtain the testimony of the engineers and firemen who were on duty at the time of the explosion, all of whom were providentially saved. This has relieved the case from much of that obscurity which has rested on other disasters of this kind, where those immediately in charge of the boilers and engine have been the principal sufferers.

We annex sketches of the longitudinal and cross sections of the boilers of the New England, reduced from the original drafts from which the boilers were constructed, which will serve to illustrate the foregoing descriptions.

The various theories and conjectures which have been put forward to account for this disaster may be comprized under the three following heads.

1. The production of some gas, (probably hydrogen,) suddenly evolved in great quantity.
2. A supposed injurious heating of the water legs, (d d d, Fig. 2,) and lower parts of the

boiler, in consequence of water being driven by the steam into the upper part of the boiler, and perhaps causing a rapid production of steam on its return to the heated metal.

3. A deficiency, at the time of the accident, in the quantity of water which it is necessary to carry in the boilers, owing to the carelessness of those in attendance, or to their being deceived in the examination of the water-cocks. It has been supposed that the metal of the boilers may thus have been weakened by heat or that the sudden suffusion of water on the metal thus heated, occasioned by the sudden discharge of steam at the safety valve, may have generated steam in such quantity, and in a manner so instantaneous, as to destroy the boiler.

4. Stress of steam, accumulated beyond what the boilers were able to sustain.

1. It is supposed by some that the explosion was produced by gas.

2. Others ascribe the explosion in question, to an over heating of the water legs of the boiler.

3. By others, the explosion is ascribed to deficiency of water.

After some lengthy objections to these suppositions, which we have not room for, they state—

"We are constrained to adopt the remaining conclusion, and give it as the unanimous opinion of the board of examiners,—That the explosion of the steamboat New England was caused by the pressure of steam, produced in the ordinary way, but accumulated to a degree of tension which the boilers were unable to sustain."

[For the American Railroad Journal.]

Mr. Editor: I wrote an article in your Journal, volume II, page 756, "on the southern termination of the Boston and Providence Railroad," which is replied to by a writer in your Journal, volume II, page 788; who attempts to convey the belief that it is the "termination of the Stonington and Providence" Railroad that is in question, instead of the Boston and Providence; by which disingenuous subterfuge, an attempt is made to deceive the public.

The low insinuations of a personal nature do not affect the merits of this question, and can have but little weight with a discerning community, who may chance to read the communications alluded to. Among other erroneous statements, this writer, referring to the Pawtucket Company, says—"These men profess to have an entire confidence on the committees appointed for the sole purpose of considering the termination spoken of." I will answer that, so far as that relates to the committee of the Boston and Providence Railroad Company, that no such confidence has been expressed.

The writer above referred to "offers his congratulations to the Pawtucket Company, on the sagacity of their counsel." Far better had this writer reserved his congratulations for the "Boston and Providence Railroad Company," whose cause, I presume, he means to espouse, (though he attempts to disguise it.)

On the honesty and integrity of their advocate, as manifested by his own false and puerile communication. As the writer above alluded to does not enter into the merit of the question, no farther remark here is necessary, but shall, in a future communication, refer to the subject of the

"Southern Termination of the Boston and Providence Railroad."

HEATING STOVES.—The wood used in close stoves should be sawed to the length of three or four inches, and put as near the door or draft as possible; one or two sticks, if placed parallel to the door, will produce a much greater body of flame than if placed in the usual direction.

ANNUAL REPORT OF THE COMMISSIONERS OF THE CANAL FUND.

The annual report of the Commissioners of the Canal Fund, was presented to the Assembly on Wednesday. It appears from this report, that the total amount of tolls collected on all the canals of the State, for the year ending 30th Sept. 1833, is as follows, viz:

Erie and Champlain canals,	\$1,324,421 63
Oswego canal,	20,950 23
Cayuga and Seneca canals,	14,783 59

\$1,360,155 45

The expenses of collection are deducted from the tolls received by the collectors, which add, say

25,800 00

And it gives, as the total amount of tolls,

\$1,385,955 45

The Erie and Champlain canal fund, has a considerable revenue in addition to that derived from canal tolls. The highly prosperous condition of this fund, is exhibited in the report as follows:

The actual amount of revenue received on account of the Erie and Champlain canal fund, from all sources, from the 30th September, 1832, to 30th September, 1833, is as follows, viz:

From tolls,	\$1,324,421 63
Vendue duty,	181,014 23
Salt duty,	227,860 05
Interest upon deposits of surplus monies,	122,236 74
Interest upon loan to Albany, and upon investments in stocks,	18,083 16
Interest on bonds for sales of lands,	934 43
Penalties, and sale of stone at little basin,	64 17

Total revenue,

\$1,874,614 41

The actual amount of expenditures during the year has been as follows, viz:

For interest on loans,	\$357,794 88
Repairs of the canals by superintendents,	330,759 44
Expenses on account of canals, by Canal Commissioners,	35,264 66
Salaries of Weighmasters, assistants, &c.,	4,602 25
Salary of clerk, and other incidental expenses,	447 34
Printing, including circulars, blanks, and all other printing for the canals,	2,016 61
Tolls refunded,	551 22
Costs of suits brought for penalties for violations of canal regulations,	489 21
To the proprietors of the Albany basin,	6,470 25
To Samuel Young, Canal Commissioner,	304 14
To George W. Newell, 2d Deputy Comptroller, canal department,	453 08
For clerk hire in the canal department of the Comptroller's office, estimated for one year,	1,300 00

739,453 08

Thus showing the nett revenue of the Erie and Champlain canal fund, after paying all expenses, to amount to the sum of

\$1,135,161 33

The report states the amount of surplus funds under the care of the Commissioners, on the 30th Sept. 1832, at

\$3,055,247 65

And the amount received since, up to 30th Sept. 1833, at

1,875,655 50

Making a total sum to be accounted for by the Commissioners, of

\$4,930,913 15

This sum is accounted for as follows, viz.

Paid for interest on canal loans,

\$356,794 88

For purchase of canal stock, viz:

5 per cents of 1837, \$414,346 47

6 per cents of 1837,	723,039 51
5 per cents of 1845,	428,924 05
	1,566,310 03
To canal superintendents,	330,759 44
To Canal Commissioners,	35,264 66
To Crooked Lake Canal Fund, premium on stock,	20,402 26
For sundry expenditures on account of the canals,	13,406 79
For clerk hire in the canal dept.,	5,390 33
	2,328,318 39

Leaving a balance in the hands of the Commissioners, on the 30th Sept., 1833, applicable to the canal debt, of

\$2,602,594 76

Of this balance there was in deposits and on loan in sundry banks, on the 30th Sept., the sum of \$2,510,941 81

Loaned and invested in stocks,

91,652 95

2,602,594 76

The Erie and Champlain canal stocks are redeemable in 1837 and 1845. The following statement exhibits the amount of stocks unpaid at the close of September 1832, the amount redeemed during the year ending 30th September, 1833, and the amount outstanding at the latter period, viz:

Six per cents of 1837, outstanding 30th Sept. 1832,

\$2,093,500 00

Redeemed during the year ending 30th Sept. 1833,

663,629 35

Outstanding, 30th Sept. 1833,

\$1,429,870 65

Five per cents of 1837, outstanding 30th Sept., 1832,

\$1,395,500 00

Redeemed during the year ending 30th Sept., 1833,

391,250 17

Outstanding, 30th Sept. 1833,

1,004,249 83

Six per cents of 1845, outstanding 30th Sept. 1832 (none redeemed),

850,000 00

Five per cents of 1845, outstanding 30th Sept. 1832,

\$2,662,035 86

Redeemed during the year,

413,497 05

Outstanding, 30th Sept. 1833,

2,238,538 81

Total amount of Erie and Champlain canal stock unpaid, 30th September, 1833,

\$5,522,659 29

From this amount deduct the monies in the hands of the Commissioners at the close of the fiscal year, and applicable to the redemption of this debt, as before stated,

2,602,594 76

And there will remain a balance of the Erie and Champlain canal debt, as yet unprovided for, of

\$2,920,064 53

If the annual receipts for three years to come should equal the revenue for the year embraced in this Report, there will be funds sufficient to pay off the entire debt contracted for the construction of the Erie and Champlain canals, nine years before the latest period fixed by the State for the redemption of the stock.

We quote the following paragraphs from the report:

Redemption of Canal Stock.

"From the foregoing statement it will be seen that since the last annual report, the commissioners have purchased and cancelled \$1,478,376 57 of the stock issued for the construction of the Erie and Champlain canals.

"The 7th sec., title 2d, of chap. 9th of the 1st part of the Revised Statutes, provides that 'the Commissioners of the Canal Fund shall, from time to time, apply the surplus revenues of the canal fund, after paying the interest of the canal debt, to the purchase of canal stock of this state, if in their opinion such stock can be purchased upon advantageous terms; and the certificates of stock so purchased shall be cancelled.

"The Commissioners have for several years been desirous of applying the surplus funds in their hands to the redemption of the debt, in conformity with the requirements of the section above quoted. Their views upon this subject have been presented to the legislature from year to year, in their annual reports.

"During a considerable portion of the year 1832,

the Commissioners kept a deposit of \$20,000 in the bank in New York, where the transfers of stock are made, for the purpose of purchasing stock, should an opportunity offer; but the effort to obtain it in this way proved entirely unsuccessful.

The surplus moneys which have been rapidly accumulating since 1826, amounted, on the 30th September, 1832, as stated in the last annual report, to the sum of \$3,055,247 65. This great accumulation of funds in the hands of the Commissioners, with the prospect of having this sum increased, by the ordinary receipts, to at least six millions of dollars, before any portion of the debt would be payable, has been a source of much solicitude to the Commissioners; and they have been so fully impressed with the importance of availing themselves of the first, and of every opportunity to purchase and cancel the stock, that all the loans and deposits of the surplus moneys have been made with reference to this object.

"The banks which receive the tolls from the collectors, and the general depositing banks in Albany, are under a stipulation to pay the Commissioners' drafts at sight, for the sums held by them respectively; and the banks which have loans from these funds, and pay 4 1/2 and 5 per cent. interest, are liable to be drawn upon by the Commissioners on a notice of sixty days. The measures of the Commissioners have been such, that there has been no period for the last seven years, in which the entire amount of funds under their care could not have been applied to the payment of the debt, on a notice of sixty days; and one half of the surplus has constantly been in a situation to be drawn at sight.

"The Commissioners have no reason to question the ability of the banks to comply with these stipulations. It has been apprehended, however, that if the moneys belonging to this fund were allowed to accumulate in the banks until the year 1837, and were to be at that time drawn for the payment of the entire sum which is then reimbursable, it might occasion a severe pressure upon the customers of the banks, if not upon the banks themselves.

"In the last annual report the Commissioners presented this subject to the consideration of the legislature, that they might, if they thought proper, prescribe limits to the loans to Banks, and also that the remarks of the Commissioners might reach the institutions interested, and prepare them for the event apprehended.

"The Commissioners were so strongly impressed with the importance of applying the surplus funds to the payment of the canal debt, that they determined in January last to redeem the stock, whenever it could be obtained on such terms as would render the purchase equal to an investment at an interest of about 3 1/2 per cent.

"On the 28th of January, the Commissioners received an offer from Messrs. Prime, Ward, King & Co. of \$30,000 of the 6 per cents. of 1837, at a premium of 9 per cent. with the addition of the interest upon the stock, from the 1st of January to the date of the purchase. This offer was accepted, and the persons of whom the stock was purchased, were informed that the Commissioners would redeem any amount of the 6 per cent. stock of 1837 at the same rate, and would pay a premium of 6 per cent. for the 5 per cents. which are reimbursable at the same time; and that these prices would be paid until the 1st of July following.

"This determination of the Commissioners was made known to other dealers in stocks; and letters were also addressed by the Comptroller to a number of the stockholders whose residences were known, offering the premiums before stated, as an inducement for them to surrender the stock."

"On the 1st of August, the stock of 1837 then having about four years to run, the Commissioners resolved to reduce the premium one per cent. and from that time, to the 1st of January, 1834, to pay 5 per cent. premium and the current interest upon the 5 per cent. stock, and 8 per cent. and interest upon the 6 per cents.; and the Comptroller, on the 7th of August, issued a circular, which was sent to all the stockholders whose residences could be ascertained."

"The efforts of the commissioners to obtain the stock were so successful, that the funds in the general depositing banks were soon exhausted,* and it

* The general depositing banks are the Mechanics and Farmers bank, and the New York State bank, of Albany. The deposits in these banks being drawn upon at sight for the current expenses of the canals, and to pay the interest upon the canal debt, the rate of interest paid for these deposits is only 3 1/2 per cent. When the commissioners commenced purchasing canal stock, there was a deposit in the banks of more than six hundred thousand dollars. The commissioners drew upon these deposits to such an extent, that on the 14th June, the amount in the Mechanics and Farmers bank was only \$47,020

became necessary to draw upon the monies which were on deposit at an interest of 4 1/2 per cent. At this rate of interest, upon a calculation merely arithmetical, it would appear less favorable to the interests of the State to purchase the stock at the premiums paid, than to continue the deposits in the banks. But the extinguishment of the State debt, always a desirable object, is peculiarly important in the case of the canal debt, from its connection, by a constitutional pledge, with the regulation of the tolls and the application of the canal revenues.—These, and other considerations, to some of which allusion has already been made, far outweigh, in the opinion of the commissioners, the apparent loss to the fund of about 1 per cent. by the purchase, and are decisive in favor of the policy which has been pursued. It is proper also to add, that the premiums paid have not in general exceeded the market value of the stocks, and the Commissioners had no alternative between paying those prices and suffering the funds to accumulate in their hands."

Loans and Deposites of the Canal Fund Monies.

"Since the last annual report, loans have been made from the surplus funds, at 5 per cent interest, as follows:

Ogdensburgh Bank, at 5 per cent.,	\$30,000 00
Bank of Albany, at 5 per cent.,	50,000 00
Leather Manufacturers' Bank, (N. Y.)	
at 5 per cent.,	50,000 00
Union Bank, (N. Y.) at 5 per cent.,	5,000 00
Yates County Bank, at 5 per cent.,	20,000 00

Total \$200,000 00

Notwithstanding the large sum which has been applied to the extinguishment of the canal debt, the interest received upon the surplus moneys remaining in the banks for the year ending the 30th of September, 1833, amounts to \$122,236 74. The estimated interest for the current year is \$130,120 61."

Reduction of Tolls.

"The Canal Board, in March last, made a reduction in the rates of toll upon wheat, flour, salted beef and pork, butter and cheese, and most of the productions of the country coming towards tide-water, which was equal to about twenty-eight and an half per cent; and a reduction upon merchandize and most articles passing from tide-water, which was equal to about fourteen and one-fourth per cent. upon the former rates. These reductions in the rates of toll, applied to the same commodities which were transported upon the canals in 1832, would have diminished the aggregate amount of tolls about 150,000 dollars. Such, however, has been the increase of business upon the canals, that the amount of tolls received from the commencement of navigation on the 22d of April, to the 30th of September, has exceeded, by the sum of \$209,566 72, the tolls for the same period of the preceding year; and by the sum of \$144,679 76 the receipts for the same months of the year of 1831. The amount of tolls was considerably diminished in July and August, 1832, by the prevalence of the cholera; and therefore the comparison is carried back to 1831, which was a prosperous season for the canals.

"How far the reductions in the rates of toll have contributed to swell the total revenue, by increasing the commodities transported, and how much of this increase is to be credited to the natural growth of the country which seeks a market through the canals, is not easily determined.

"In relation to the trade of the western States generally, the maximum of revenue to the Canal fund, is probably to be attained, by a considerable reduction from the present rates of toll. Merchandize, during the past season, has been transported through the Erie canal, by way of the Lakes and the Ohio canal, to the borders of the Mississippi. To continue and extend this trade, a further reduction of 25 per cent. of the tolls on merchandize, bringing that article within a fraction of the constitutional minimum, is contemplated.

"An arrangement has been made between the canal board of this State, and the Canal Commissioners of Ohio, by which it is expected that a reduction in the rates of toll upon merchandize, of 25 per cent. from former rates, will take place simultaneously upon the New York and Ohio Canals, at the opening of navigation in the spring of 1834.

"If the Canal Board had the power of reducing

the toll upon lead, to one or two, instead of five mills per 1000 pounds per mile, it is supposed that a branch of trade, important to our citizens generally, if not to the canal revenue, might be opened with the mining country between Lake Michigan and the Mississippi river. The revenue could not be diminished, and might be considerably increased, by such a reduction in the rates of toll."

The condition of the lateral canals, as exhibited in the report, is somewhat unfavorable. The tolls are insufficient to keep them in repair and pay the interest upon the debts created in constructing them. The following sums have been drawn from the treasury to make up the deficiencies in the revenues of the several canals named, to wit:

Oswego canal.....	\$12,738 8
Cayuga and Seneca.....	5,226 44
Chemung.....	41,730 28

Total sum paid from the Treasury to make up deficiencies.....\$63,295 54

The debt standing against the state, on the 30th of September, for the several canals, was as follows, to wit:—

Erie and Champlain canal debt.....	\$5,532,639 29
Oswego do.....	327,347 00
Cayuga and Seneca do.....	257,000 00
Chemung do.....	316,000 00
Crooked Lake do.....	120,000 00
Chesapeake do.....	50,000 00

Total.....\$6,673,406 29

CONSUMPTION OF STAPLE ARTICLES IN ENGLAND.

"The following is an accurate estimate of the home consumption of England in the great staple articles of commerce and manufactures. Of wheat, 15,000,000 quarters, or 120,000,000 bushels, are annually consumed in Great Britain—this is about a quarter of wheat to each individual; of malt, 25,000,000 bushels are annually used in breweries and distilleries in the United Kingdom, and there are 46,000 acres under cultivation with hops; of the quantity of potatoes and other vegetables consumed we have no accounts; of meat, about 1,250,000 head of cattle, sheep, and pigs, are sold during the year in Smithfield market alone, which is probably about a tenth of the consumption of the whole kingdom; the quantity of tea consumed in the United Kingdom is about 30,000,000 pounds annually; of sugar nearly 4,000,000 cwt., or about 500,000,000 pounds every year, which is a consumption of 20 pounds for every individual, reckoning the population at 25,000,000; and of coffee about 20,000,000 pounds are annually consumed; of soap 114,000,000 pounds are consumed; and of candles about 117,000,000 pounds; of sea-borne coals alone there are about 3,000,000 chaldrons consumed in England and Wales, and it is estimated that, adding the coals of the midland counties, each person of the population consumes a chaldron throughout the kingdom; of clothing we annually manufacture about 200,000,000 pounds of cotton wool, which produces 1,200,000,000 yards of calico, and various other cotton fabrics, and of these we export about a third, so that 800,000,000 yards remain for home consumption, being about 32 yards annually for each person; the woollen manufacture consumes about 30,000,000 pounds of wool; of hides and skins about 50,000,000 are annually tanned and dressed; of paper about 50,000,000 pounds are annually manufactured, which is about 2,000,000 reams of 500 sheets to the ream.—[Farmer's Magazine.]

BUTTER IN NEW-YORK AND LONDON.—On

the supposition that half a pound of butter is consumed by each inhabitant of this city, in a week, 6,500,000 pounds would be required in a year. This, at 20 cents per pound, amounts to \$1,300,000. This sum is considerably less

than that paid by the inhabitants. Allowing 150 pounds to each cow, 43,333 cows would be required. The following we take from an English paper.

"Butter is very extensively used in this and most other northern countries: that of England and Holland is reckoned the best. In London, the butter of Epping and Cambridge is in the highest repute: the cows which produce the former, feed during summer in the shrubby pastures of Epping Forest; and the leaves of the trees, and numerous wild plants which there abound, are supposed to improve the flavor of the butter. It is brought to market in rolls from one to two feet long, weighing a pound each. The Cambridgeshire butter is produced from cows that feed one part of the year on chalky uplands, and the other on rich meadows or fens: it is made up into long rolls like Epping butter, and generally salted or cured before being brought to market; the London dealers, having washed it, and wrought the salt out of it, sell it for Epping butter.

"The butter of Suffolk and Yorkshire is often sold for that of Cambridgeshire, to which it is little inferior. Somersetshire butter is thought to equal that of Epping; it is brought to market in dishes containing half a pound each; out of which it is taken, washed, and put into different forms, by the dealers of Bath and Bristol. Gloucestershire and Oxfordshire butter is very good; it is made up in half-pound packs or prints, packed up in square baskets, and sent to the London market by waggon. The butter of the mountains of Wales and Scotland, and the moors, commons and heaths of England, is of excellent quality when it is properly managed; and though not equal in quantity, is superior to that produced by the richest meadows.

"Considerable quantities of butter are made in Ireland, and it forms a prominent article in the exports of that country; it is inferior to that of England. Some of the best Irish butter brought to London, after being washed and repacked, is sold as Dorsetshire and Cambridge butter.

"The salt butter of Holland is superior to that of every other country; large quantities of it are annually exported. It forms about three-fourths of all the foreign butter we import.

"The production and consumption of butter in Great Britain is great. The consumption in London may be averaged at about one half-pound per week for each individual, being at the rate of 26 pounds a year; and supposing the population to amount to 1,450,000, the total annual consumption would be 37,700,000 pounds, or 16,830 tons: but to this may be added 4,000 tons for the butter required for the victualling of ships and other purposes, making the total consumption, in round numbers, 21,000 tons, or 47,040,000 pounds, which, at 10d. per pound, would be worth £1,960,000.

"The average produce per cow of the butter dairies is estimated by Mr. Marshall at 168 pounds a year; so that, supposing we are nearly right in the above estimates, about 280,000 cows will be required to produce an adequate supply of butter for the London market.

"But the consumption of butter in London has sometimes been estimated at 50,000 tons; which would require for its supply 666,000 cows!"

83, and in the New York State bank \$48,474 49. It will be seen by reference to the table marked B. that the total sum received by the two banks above named, during the year, was \$1,336,515 47; and that the sum drawn from them by the Commissioners during the same time, was \$1,571,112 43. The accommodation afforded by these banks, in giving drafts on New York, to pay for stock purchased, has greatly facilitated the operations of the Commissioners in cancelling the debt, and has enabled them in all cases to transmit the funds for the payment of stock, on the afternoon of the same day on which notice of its purchase was received.

Report of WALTER GWYNN, Esq., Engineer, to the President and Directors of the Portsmouth and Roanoke Railroad Company.

SUFFOLK, Nov. 18, 1833.

To the President and Directors, &c.:

GENTLEMEN—I have the honor to submit to you the following report and estimate of the probable cost of your railroad:

The ease with which the supposed difficulties in the construction of the road between Portsmouth and Suffolk have been overcome, will dissipate all apprehensions as to the feasibility of the work, and the expediency of the undertaking has been so fully and clearly established by former statements to the company, as to render further comment unnecessary on the present occasion. I shall therefore proceed to the subject immediately before me.

The line which I have selected as the basis of my estimate, commences at the intersection of the western boundary of Portsmouth and the centre line of High street, and proceeds over an extremely level and unbroken surface to an eligible site for crossing by a bridge a branch of the Nansemond River, a few hundred yards north of the termination of the Dismal Swamp Land Company's Canal. Thence continuing the line to Suffolk several spring branches are crossed, requiring the construction of small stone drains and some heavy cuttings and fillings. After leaving Suffolk the character of the country changes and becomes somewhat bold—and in order to diminish the quantity of excavation and embankment several undulations in the plane of the railroad are unavoidably made—the inclinations are, however, gentle, and the line reaches Blackwater without encountering any other difficulties than an increased expenditure on this portion of it. From Blackwater a level is maintained for some distance, the line passes along the borders of the Swamps, which make up to the Highlands and crossing the Nottoway, on the lands of Mr. Rochelle, about seven miles below Jerusalem, it ascends at the rate of twenty feet per mile, passing near Mr. Gurley's, to the Cypress Bridge Road. Thence, leaving Vick's Chapel a little to the south and making a slight undulation to avoid some filling, the line arrives at Captain Barnes's Quarter, on the summit of the ridge dividing the waters of the Nottoway from those of the Meherrin. From Captain Barnes's a descent is effected on a grade of twenty feet per mile to Buckhorn Run. Thence the line is continued, on a level, across the Meherrin, about a mile above Branch's Bridge. It then ascends, varying from an inclination of twenty to twelve feet per mile, until the summit of the railroad is attained, giving an elevation, above the level of tide water, of one hundred and forty-four feet.

Descending from the summit, the line crosses the Petersburg Railroad, (on a level with that road), about two hundred yards south of Captain Garey's. It afterwards crosses the head of Raccoon Swamp, and terminates on the north bank of the Roanoke river, opposite Weldon. Its direction is S. seventy W., and its length seventy-seven miles, being only a half mile longer than the distance on a direct line between Portsmouth and Weldon. On reference to the profile, the inclinations and distances will be found as follows:

TABLE OF ASCENTS AND DESCENTS FROM PORTSMOUTH TO THE ROANOKE.

From Portsmouth to Suffolk.

—	3550	12.00	8.067
—	370	11.00	11.770	10.208
—	4900	10.00	12.500
1	1320	0.00	30.085
3	1810	7.00	25.056
3	3060	5.00	10.795	2.746
2	840	4.00	4.099	3.545
—	2900	3.00	3.295
—	4630	2.00	2.008	12.826
1	520	1.00	1.430
1	220
6	2170
1	2270
59 m.	5160 ft.			

From an inspection of the above table, it will be perceived that the greatest inclination does not exceed 20 feet to the mile, and throughout the whole extent of the road there are but few deviations from a straight line, and these are effected on the arcs of circles whose radii are in no instance less than 5730 feet, and are most generally 11,460 feet in length.

Gentle inclinations and easy curvatures (when it is necessary to vary from a straight line) are points of essential importance in the location of railroads; these desirable objects, as well as a line extremely favorable to the advantageous employment of locomotive engines, are here attained. Indeed, considering the straightness and the moderate ascents and descents, the performance of an engine (of given power) will be greater on this than on any other railroad now constructed in the United States. We are therefore enabled to use light engines, thereby diminishing very considerably the great and leading items in the expense of transportation on railroads, viz: wear and tear and repairs.

The engine which it is proposed to use will not exceed five tons weight, and its performance on this road will be equal to that of a six ton engine, on a road with 30 feet grades. From this general view it will be seen, that the face of the country is eminently suitable to the proposed work. The intervening Swamps and the alluvial bottom lands of the Nottoway, Blackwater and Meherrin, offer no serious obstacles. The bottom is every where composed of solid materials, affording a firm foundation for any embankment or other structure it may be necessary to place on it.

Before proceeding with the estimate I would offer a few remarks in relation to the construction of the railroad.

It will not be necessary on the present occasion to discuss the relative merits of the various modes of construction, and the variety of materials which have been used in the formation of railways. Suffice it to say, that the almost universal substitution of wood for stone, and the iron-edge rail, establishes its preference in the first instance, even where stone is abundant and timber scarce. Among the many reasons for this preference of wood are its elasticity, its sufficient stability, and its diminution of the wear and tear of engines and cars. It follows, then, as a necessary consequence, that I recommend for your railroad the use of timber, which is found in abundance, of excellent quality, on almost every part of the line.

The superstructure, then, which I propose to adopt, will be heart-pine rails, nine by five inches, plated with iron bars two inches wide, and half an inch thick, resting on white or post oak sills, ten by twelve inches, and eight feet long, placed across the road, five feet apart from centre to centre. The rails will be placed parallel to each other four feet eight and a half inches apart, let into the sills and properly secured by white oak wedges. The sills will be notched for the reception of the rails and wedges, and hollowed out in the middle, so as to admit of the construction of a path over them, which will add considerable stiffness to the road, at a very moderate expense, and adapt it to the use of either horse or locomotive power, or both.

WIDTH OF ROAD-BED.—I have estimated for a single railway, which for the present will afford sufficient accommodation to the trade and travel. The ditches, however, will be cut, and the waste earth disposed with a view to a double track, whenever it may be deemed necessary. The graded surface of the road-bed in excavations, will vary from 18 to 16 feet in width, the slopes being 45 degrees. The graded surface on embankments will present a uniform width of 12½ feet, with side slopes of 33½ degrees, or 1½ base to 1 perpendicular.

Between Suffolk and Spikes' Run we shall pass several small streams by means of stone drains. The stone for this purpose can be readily obtained at Port Deposit, and the work done now, on as reasonable terms as at any other period. Farther on, wooden structures will be thrown over the water courses, with a span affording sufficient room for the erection here.

after of stone or brick culverts. The bridges across the Blackwater, Nottoway and Meherrin rivers, will be supported by abutments and piers of masonry, the stone for which can be transported by water from Norfolk to their respective sites, and will not at most exceed \$5 per perch (of 25 cubic feet) delivered. On approaching the Roanoke, rock is found tolerably convenient to the line, and will probably be used in crossing the Oconeechee, Troublefield, and Raccoon Swamp.

[To be continued.]

[For the American Railroad Journal.]

Mr. EDITOR—The Delaware and Hudson Canal Company have put in the Delaware, on the North river, "Disbrow's Combined Steam Boiler," to test the best method to create steam with anthracite coal; and the following are some of the many benefits derived:

1st. This new boiler, in the Delaware, will generate steam faster with Lackawana coal than the old boiler, which was much larger, ever did with the best pine wood.

2d. The saving of fuel, by these experiments, has been proved to be 25 per cent.; and competent and experienced judges say, that no doubt one half may be saved.

3d. The saving of labor in tending s at least one half.

4th. But little room will be required for this fuel, on board the boat; and no detention of boat occasioned in putting it on board.

5th. And last, though not least, in the minds of passengers, a boiler of this construction, with one row of cones, can be so disposed of, on the wings of the boiler, that in case of explosion it would be thrown overboard.

All persons building new boats would be richly repaid by examining the great advantages obtained by this experiment.

I will send you a drawing, to be inserted in a future number, that a description of this boiler, and a knowledge of its utility and advantages, may be widely extended.

A. Z.

AGRICULTURE, &c.

USEFUL INSTRUCTIONS REGARDING THE MILKING OF COWS.—The operation of milking is performed differently in various parts of the country. In some, the dairy-maid dips her hand into a little milk, and by successively stripping the teat between her finger and thumb unloads the udder. The plan, however, is attended with the disadvantage of irritating more or less the teat, and rendering it liable to cracks and chaps, which are followed by inflammation, extending to the rest of the quarter. This accounts for the disease occurring more frequently among the cows under the charge of one milker than it does in those which are under the charge of another; and, as this practice is more common in some parts of the country than in others, it also accounts for the disease being more common in these parts. This plan of milking, where the irritation is not sufficient to excite the extent of inflammation to which I have alluded, frequently produces a horny thickening of the teat, a consequence of the cracks and chaps, which renders it more difficult to milk than when in its natural state; and, at the same time, predisposes to inflammation, when any cause occurs to set it up. These effects may be, and are almost entirely avoided, by the more scientific plan of milking adopted in other parts of the country, where, instead of drawing down or stripping the teat between the thumb and fingers, the dairy-maid follows more closely the principles which instinct has taught the calf. (The calf jerks its nose into the udder, and forces down the milk.) She first takes a slight hold of the teat with her

hand, by which she merely encircles it; then lifts her hand up, so as to press the body of the udder upwards, by which the milk escapes into the teat, or if (as is generally the case when some hours have elapsed between milking-times) the teat is full, she grasps the teat close to its origin with her thumb and fore finger, so as to prevent the milk which is in the teat from escaping upwards; then making the rest of the fingers to close from above downwards in succession, forces out what milk may be contained in the teat through the opening of it. The hand is again pressed up and closed as before, and thus, by repeating this action, the udder is completely emptied, without that coarse tugging and tearing of the teat, which is so apt to produce disease.—[Quarterly Journal of Agriculture.]

MEANS OF RENDERING THE VINE MORE PRODUCTIVE.—A foreign journal, of some ability recommends four ounces of alum to be mixed with four pellets of clay, by means of a sufficient quantity of water, and the roots of the vine being uncovered on a fine day towards the end of winter, they are to be moistened with this mixture, and the earth then changed, so that what was previously uppermost shall be undermost. It is asserted that through this operation a vine produces a great additional quantity of grapes.

INCREASE OF BEES.—The recent improvements in preserving bees will probably produce very great additions of honey, at a much cheaper rate. We still import honey from the Havana. The following we extract.

“It is not to be expected that many will attend to bee-husbandry merely for the sake of pleasure, but profit may induce others to follow that employment during their leisure hours. Often has the industrious laborer or mechanic been relieved from embarrassed circumstances, by the toil and labor of a swarm of bees, when he could avail himself of no other mode of relief. Not only are bees of immediate profit to their owners, but were they encouraged to the extent of which the pasture of the United Kingdom would permit, they might become even a source of national wealth. It is estimated by persons of learning, that the pasture of Scotland could maintain as many bees as would, on an average, produce 4,000,000 pints of honey, and 1,000,000 pounds of wax. Were this quantity tripled for England and Ireland, the produce of the empire would be 12,000,000 pints of honey, and 3,000,000 pounds of wax, annually. The income that would thus arise from honey, at the very moderate price of 5s. per pint, would amount to £3,000,000 sterling; and the wax, at 1s. 6d. per pound, would produce £2,225,000 sterling, affording, in round numbers, a total of £3,225,000 annually. The rearing of the bees must, therefore, appear to be an object worthy of the consideration of all who feel an interest in the welfare of their country. As there are few concerns more profitable than bees, in favorable seasons, considering the small expense that attends them, I humbly beg leave to lay before my readers the following estimate. Suppose a person to commence with only two hives, which may cost £3 10s. sterling, and allowing each hive, on an average, only to double its number annually, they would increase as follows in a period of ten years—

1st year, 2 hives; 2d, 4 do.; 3d, 8 do.; 4th, 16 do.; 5th, 32 do.; 6th, 64 do.; 7th,

128 do.; 8th, 256 do.; 9th, 512 do.; 10th, 1024 do.

At this rate, two hives would produce one thousand and twenty-four swarms in the period of ten years, which, at a very moderate calculation, would be worth £1 15s. sterling, each, so that there would be a clear profit of £1,792 sterling, for a little attention to the rearing and proper management of the bees, allowing the second and third swarms to pay for the hives, stools, labor, and incidental losses. It may be supposed by the above estimate that the seasons are favorable, but allowing 50 hives to fail from various causes, there would still remain £1,700 10s. sterling of clear profit. The years 1824 and 1825 were very favorable for bees, the latter was remarkably so. Almost every hive that year swarmed once, many of them twice, and a few even three times. When the store was collected, they weighed from 25 to 40 pounds each hive. Notwithstanding, I read in the public papers that honey to the value of £240,000 sterling had been imported into Great Britain in the course of this same year, 1825; a most extraordinary sum, and one which in my humble opinion might have been easily saved to the nation, if a stricter attention had been paid to the proper encouragement of our own bees.—[The Bee Garden.]

SKINLESS OATS.—At the meeting of the Warwickshire Agricultural Society, a specimen of the *Avenaica Farina*, or skinless oat, was produced by the Rev. Mr. Knott, which had been plucked that morning out of a piece of ground belonging to that gentleman, at Wormleighton. It was produced from seed furnished to him from Mr. Trucker, of Heanton Punchardon, near Barnstaple, Devonshire. According to the account furnished to us by that gentleman, it was grown in the season of 1830, for the first time it was ever produced in Great Britain, by Thomas Derenzy, Esq. of Clebemon Hall, who obtained the seed through a friend of his at Rotterdam, whether it was imported from Shantag, a remote district in China, and was quite unknown to Europeans till within these three years. The advantages which this extraordinary and valuable grain possesses over all other kinds of oats are numerous, viz.: When thrashed from the sheaf, it is exactly like oatmeal, and it is fit for immediate use for culinary purposes, and every other sort which oatmeal is consumed for, the grain being quite free from every particle of rind or husk. The flavor is delicious, and it contains much more farinaceous matter. There is, of course, considerable saving of oats, and expense of kiln drying, sifting, &c. &c.; and one peck of it contains more nutritious food for a horse than three pecks of common oats. The produce is most astonishing, the average being twenty-six barrels, of fourteen stone, to the Irish acre—the exact quantity grown by Mr. Derenzy on one acre. It was not sown till the 4th May, 1830, and was reaped early in August the same year. It is remarkably hardy, and well adapted to this climate.

POTATOES FOOD FOR HORSES.—An Irish writer on husbandry, whose name is Martin Doyle, and whose works were published in Dublin in 1830, has the following remarks:

With respect to potato-feeding for horses, I recommend it from an experience of some years. My horses are old (one of them at least 20 years of age), but they are in high spirits and condition, from having every eve-

ning after work, excepting during the soiling months [when grass &c. was cut and carried to them,] an abundant supply of boiled potatoes (warm) regularly given to them; but as the authority of T. C. Curwen, Esq. M. P. of Workington Hall, Cumberland, is infinitely more valuable than mine on this subject, I shall quote the following passages from his ‘Agricultural Hints.’

‘It requires from 5 to 6 hours for a horse to masticate a stone [14 lbs.] of hay, while he will eat a stone of potatoes in 20 minutes or less. The saving of 4 hours for rest, is alone sufficient to produce the greatest difference in the health and condition of the animal. After great fatigue also, a horse would be tempted to take warm food when he would not eat hay. I have at this time in my works, horses which were purchased six years ago of a farmer, who was selling off his stock as worn out and of little value, and which are yet able to do their work with the best horses I have. I think there is little doubt of the life of this valuable animal being considerably prolonged by this mode of feeding—I have begun to mix an equal quantity of cut straw and potatoes; racks are, according to this mode of feeding, as unnecessary as they are productive of waste—for to save trouble they are always filled, and what is not eaten is always so tainted with the breath of the animal as to be wasted.’

Probably steamed mangel wurtzel, and other roots, would be valuable as food for horses.—[N. E. Farmer.]

BAYBERRY BARK.—The bark of the root of the bayberry bush, which grows so plentifully in the woods and waste fields of this county, has become of late quite an article of traffic. We learn that it is used at the manufacturing for the purpose of dying. In the town of Harwich, we are informed that a great quantity of this bark, (perhaps 30 tons,) has been collected during the past season by the women and children, who obtain at the stores three cents per pound for it. It is sent to Taunton, Fall River, and other manufacturing places, where it is sold for 12½ cents, and in some instances much higher. It is also used for medicinal purposes. This bark is easily obtained; the bushes grow in a light soil, the roots near the surface; they are pulled up with little strength and dried, and then the bark flies off with a gentle pounding. We believe this is the greatest benefit this county has ever received from the ‘American System.’—[Barnstable Patriot.]

PLOUGHING IN WINTER TO KILL INSECTS.—Professor Rennie says, the common notion of frost killing insects is far from being correct. We, however, give the following from the Bucks County (Pa.) Intelligencer:

Last winter, observing several weeks of open and mild weather, unsuitable for threshing, I ploughed up a stiff sward, in a field which had been infested with the *Wire-worm*, for nearly thirty years. The ravages of this insect had even been so great, that not more than half a crop had been raised on the field during all this time. The ground was ploughed a good depth, say from eight to ten inches. About the middle of April it was well harrowed, and afterwards ridged. I planted about the first of May, and, from the present prospect, I should think the field would average forty bushels of corn per acre—and no *Wire-worms* appeared. I know not whether success is to be attributed to the time of ploughing; but it is an experiment, which, giving a favorable result in one instance, may induce others to examine into the best means of guarding against this potent enemy to agriculture.

AGRICOLA.

NEW-YORK AMERICAN.

JANUARY 13—17, 1834.

LITERARY NOTICES.

No. X.

DETROIT, November 25.

I had just left the reading room of the Franklin Hotel, in Cleaveland, and was making myself at home for the rest of the evening, in my own neat chamber, when the sound of a steamboat bell, about nine o'clock, gave note that one of these vessels, which at this stormy season cannot navigate the lake with any regularity, had touched at Cleaveland on her way to this place. No time was to be lost, and huddling my clothes, &c. into my trunk as quickly as possible, I jumped into a vehicle waiting at the tavern door, and in a few minutes was upon the quay. Here I witnessed a scene of indescribable confusion. The night was dark and somewhat gusty, and the boat and the wharf were both crowded with boxes, bales, and the effects of emigrants, who were screaming to each other in half as many languages as were spoken at Babel. Lanterns were flashing to and fro along the docks, and hoarse orders and countermands, mingled with the harsh hissing of the steam on every side. At length we pushed from the shore, and escaping in a moment from the head of the mole, stood fairly out into the lake, while the bright beacon of the Cleaveland lighthouse soon waned in the distance, and was at last lost entirely. I found myself, upon looking around, on board of the fine steamboat "New-York," captain Fisher, to whose politeness I was much indebted for showing me about the boat before turning in for the night. Taking a lantern in his hand, and tucking my arm under his, he groped about among his motley ship's company like Diogenes looking for an honest man. Our course first led us through a group of emigrants collected around a stove mid-ships, where an English mother nursing her infant, a child lying asleep upon a mattress, and a long-bearded German smoking his meerschaum on the top of a pile of candle-boxes, were the only complete figures I could make out from an indefinite number of heads, arms, and legs, lying about in the most whimsical confusion. Passing further on we came to two tolerable cabins on either side of the boat just forward of the wheels, both pretty well filled with emigrants, who were here more comfortably bestowed. We next passed the forward bar-room, (there being another abaft for cabin passengers,) and finally came to the bow, of which a horse and several dogs had already been the occupants for so many days, the New-York having been twice driven into port and delayed by stress of weather, that it might have been mistaken for either stable or kennel. A noble English blood-hound, the second dog only of that rare breed that I have ever seen, here attracted my attention, and delayed me until I made his acquaintance, which was but a moment, however, for every dog of a generous strain can tell instinctively when a friend of his kind approaches him. Among others of the canine crew, too, there was a fine spaniel, whose deplorable fate subsequently I may as well mention here as elsewhere. The master of poor Dash, it seems, went ashore during the night at Huron, where the boat put in to land way-passengers, and the animal springing eagerly along a plank at his call, was kicked from his narrow foothold by some brute of a fellow into the lake. The night was dark, and the shadow of the high wharf shut out the few lights on shore from the view of the poor animal, while those on board of the boat led him away from the land. He swam after us, yelling most piteously, until his suffocating cries were lost in the freshening sea, which probably the next morning tossed him a carrion on the shore. Had I witnessed the act of throwing him overboard, I could not have restrained myself from pitching the dastardly perpetrator of the cruelty af-

ter the victim of his brutality: for if there be one trait in men, which awakens in me, indignation amounting almost to loathing of my kind, it is to see human things treating those parts of the animal creation beneath them, as if this earth was meant for none of God's creatures but man. If Heaven ever grants us another revelation, I am convinced there will be yet one more commandment added to the decalogue, besides those which enjoin upon us our duty to God and our neighbor, and that will be, our duty to those of the brute creation, which Providence entrusts to our kindness and our care. But to return to our travels through this floating castle—we next ascended a steep stairway to the upper deck of all, and I here spent some moments rather amusingly in surveying the furniture of the emigrants with which it was crowded. They differed according to their origin. The effects of the Yankee were generally limited to a Dearborn wagon, a feather bed, a saddle and bridle, and some knickknack in the way of a machine for shelling corn, hatching flax, or, for ought I know, manufacturing wooden nutmegs for family use. Those of the Englishman are far more numerous; for John Bull when he wanders from home, would not only, like the roving Trojan, carry his household gods with him into strange lands, but even the fast anchored isle itself could he but cut it from its moorings. Whenever, therefore, you see an antique fashioned looking-glass, a decrepit bureau, and some tenderly preserved old china, you will probably upon looking further have the whole housekeeping array of an honest Briton exposed to your view. But still farther do the Swiss and Germans carry their love of family relics. Mark that quaint looking wagon which lunders up a dozen square feet of the deck. You may see a portrait of it among the illuminated letters of a vellum-bound edition of Virgil's *Bucolics*. It was taken from a Helvetian ancestor that transported Cæsar's baggage into winter quarters. It might be worth something in a museum, but it has cost five times its value in freight to transport it over the Atlantic. What an indignity it is to overwhelm the triumphal chariot with the beds and ploughs, shovels, saddles and sideboards, chairs, clocks and carpets, that fill its interior, and to hang those rusty pots and kettles, bake-pans, frying-pans and sauce-pans, iron candlesticks, old horse-shoes, and broken tobacco-pipes, like trophies of conquest over Time, along its racked and wheezing sides. That short man yonder, with square shoulders and a crooked pipe in his mouth, is the owner; he with the woollen cap, that is just raising his blue cotton frock to thrust his hand into the fob of his sherrivalleys. That man had probably not the slightest idea of the kind of country he was coming to. His eyes are but now just opening to his new condition; nor will he sacrifice a particle of his useless and expensive trumpery, until they are completely open. That man has not yet a thought in common with the people of his new abode around him. He looks indeed as if he came from another planet. Visit him on his thriving farm ten years hence, and except in the single point of language, you will find him (unless he has settled among a nest of his countrymen) at home among his neighbors, and happily conforming to their usages, while that clean looking Englishman next to him will still be a stranger in the land.

I subsequently looked into the different cabins and compartments of the boat not yet visited, and had reason to be gratified with the appearance of all; though the steamboat Michigan, which I have since visited at the docks here, puts me completely out of conceit of every part of the New York, except her Captain. The Michigan, machinery and all, was built at Detroit; and without entering into a minute description of her, I may say, that fine as our Atlantic boats are, I do not recollect any on the Atlantic waters, for strength and beauty united, equal to the M.

It is worth a journey to the Lakes to make a trip in her. A great mistake, however, I think, exists here in building the boats for these waters with cabins on deck, like the river boats. In consequence of such a large part of the hull being above water, they are rendered dangerous during the tremendous gales which sweep lake Erie, and are often compelled to make a port of safety several times during a passage. The English steamers which ply between Dover and Calais are built like other sea vessels; and having their machinery below, can consequently keep on their course in a sea where one of ours would live but a few minutes. I was fortunate, considering the stormy season of the year, in having a tolerably smooth passage across the lake, there being but few persons sea-sick aboard the boat, and I happily not included in the number. But it must be very unpleasant, during a heavy blow, to be tossed on the short cobble sea which the light fresh water of these lakes always breaks into beneath the wind.

We passed a number of islands soon after breakfast in the morning; some of them mere rocks, and others several miles in circumference. On one of these, of a few acres in extent, a row boat, in which a man undertook to transport himself and one or two members of his family to the shore, was wrecked some years since. The father and brother, with a daughter of about 12 years, managed to subsist upon the snakes and snails they found among the rocks, until a passing vessel took them off, after some ten days of suffering.

It was during a shower, shortly after noon, when some low wooded islands on the American side of the lake, with a tall flag-staff peering above the haze from the little town of Amherstburgh on the British shore, indicated that we had entered the mouth of the Detroit river. The wind, which was now beginning to rise into a threatening tempest, compelled us to hug the Canadian shore so closely, that the red-coated sentinel, pacing along the barracks above Fort Malden, was plainly seen from the boat. The river soon after narrows sufficiently for one to mark with ease the general appearance of its banks and the different settlements upon their course. Their appearance must be pretty in summer, when fields and woods show to the most advantage. But now, though slightly undulating, with a sudden rise from the river of some fifty or sixty feet, the adjacent country is too low to be strikingly beautiful. Those, however, who admire the Delaware below Trenton, if they can dispense with the handsome seats which ornament its not very clear waters, may find a charm in the gentle banks and transparent tide of the Detroit river.

The city of Detroit itself stands upon an elevated piece of table land, extending probably for some twenty miles back from the river, and being perfectly unbroken for at least two miles along its margin. Beneath the bluff—for the plain is so high as almost to deserve the name—is a narrow bustling street of about half a mile in length, with the wharves just beyond it; and fifty yards inboard runs a spacious street, called Jefferson Avenue, parallel with the lower street and the river; for three or four miles along this latter, the chief part of the town is built. The dwelling houses are generally of wood, but there are a great many stores now building, or already erected, of brick, with stone basements. The brick is generally of an indifferent quality, but the stone which is brought from Cleveland, Ohio, is a remarkably fine material for building purposes. It is a kind of yellow free stone, which is easily worked when first taken from the quarry, and hardens subsequently upon exposure to the air. There are at this moment a good many four story stores going up in Detroit, as well as other substantial buildings, which speak for the flourishing condition of the place. The want of mechanics is so great, however, that it is difficult as yet to carry on these operations upon the scale common in our At-

lantic cities, although the demand for houses in Detroit, it is said, would fully warrant similar outlays of capital. The public buildings are the territorial Council-house, situated upon an open piece of ground, designated on an engraved plan of the city as "The Campus Martius," a Court house, Academy, and two banks. There are also five churches, a Catholic, an Episcopal, a Presbyterian, Baptist and Methodist. The Catholic congregation is the largest, and their stone church, which after remaining several years in an unfinished state, it is said, is now soon to be completed with funds derived from Rome, will make an imposing appearance when finished. The population of Detroit is, I believe, between three and four thousand—it increases so rapidly, however, that it is difficult to form an estimate. The historical associations, the safety, and commodiousness of the harbor with its extensive inland commercial advantages, must ever constitute this one of the most interesting and important points in the Union, although other causes may combine to make newer places in the territory equally as flourishing as Detroit.

The appearance of the place is any thing but what you would expect from a town founded in the same year with Philadelphia. The ancient houses which formerly stood upon streets hardly ten feet wide, were all swept away in the great fire twenty years since, and the new white dwellings standing upon broad avenues of twenty-five yards, make the town show like a place of yesterday.

I am surprised to find so few military remains in a frontier post so frequently fortified, and which has witnessed so many scenes of border war. A small stone arsenal, with a tall picket fence around it, is the only thing of the kind discoverable, and yet the place is thought by military men to have been sufficiently strong during the last war, to have held out, if properly commanded, against twice the force which the brave General Brock brought against it. The lapse of twenty-two years has not yet cooled the indignation of the inhabitants at its dastardly surrender by Hull. It is necessary to see the ground to estimate properly that besotted act, at which his officers broke their swords, and his men nearly rose in open mutiny, while even the women of the fort shut the gates and declared that their husbands and brothers should not abide by the disgraceful orders of their commander. It is astounding to think how slight an exertion of force might have annihilated the attacking party. They landed about two miles below the town, and advanced in solid column along a straight road, which runs parallel with the river, and is walled inland with a high picket fence, in front of the French farm-houses which line the way. At the entrance of the town, and nearly in front of the handsome hotel where I am staying, were planted two pieces of cannon, loaded with grape and canister. A single discharge must have swept half of the British force into eternity, while the river on one side, and the high picket on the other, would have hedged the remainder in upon a spot where the slaughter of the whole would have been inevitable. The artillerymen were standing with lighted portfires when the order to retire within the fort caused them to fling their matches to the ground, and leave it with disgust. The memory of General Hull, which with that love of glorification that constitutes the weakest point of our national character, was so hallowed in the Eastern newspapers when he died, a few years since, is here held in the contempt that was the due of a man who was sentenced to be shot to death for conduct entailing so much disgrace upon the nation.

I was not a little amused while talking over these events, upon the very scene of contention, with some gentlemen a few evenings since, to hear a person, whom I soon discovered to be an Englishman, sliding into the conversation,

and taking his part of it with equal animation and good feeling; upholding, however, like a leal and true Briton, the acts of his own nation. The conversation was very frank on both sides, although when he spoke of the Kentuckians slaying the body of Tecumseh after the battle of the Thames, I could not trust myself to retaliate by mentioning Proctor's massacre at Frenchtown of the flower of the youth of Kentucky, which, as you know prompted this ferocious act of their countrymen in relation to the fierce but noble savage. The ball of conversation which had hitherto been thrown with equal temper and breeding by better and abler hands, fell into mine, just as "the delicate question of impressment" was suggested by the English stranger, and in begging him to dismiss a matter upon which our views could so little harmonize; I could not help adding the opinion you have often heard me express, that my country should never notice the existence of that national difficulty, except through the mouths of our cannon, that is, that we should regard and treat impressment like piracy or kidnapping on the high way.—"Kidnapping!" exclaimed my well bred antagonist, politely waving the further discussion of the subject of the word, "why, I myself, Sir, have been taken up for kidnapping within the very precincts of this town." He then went on to tell in most admirable style, a series of whimsical adventures which he met with, when on a surveying party on the lakes, just after the last war—"surveying on the lakes twenty years ago," exclaimed I to myself, why, who can this man be? I have already travelled with him since tea, over all Europe, and a greater part of Asia, not to mention the West Indies, and South America, with the whole coast of Africa.) The lively and unaffected relation was every thing to the story, which at once enlisted the attention of all present, but the particulars were barely these:—The stranger, then a subaltern in the British service, was sent by his commanding officer, to catch some deserters, who had escaped by night from the schooner in which the surveying party were embarked, and which was anchored in the Detroit river. He landed on the American shore, and tracing one of the knaves to an Inn hard by, he seized him near the door, handcuffed the fellow, and handed him to his men to take off to their boat in waiting. Then entering the inn the sight of a number of articles stolen by the runaways, induced the young officer to search for the rest of their number. Provoked at his want of success, he very naturally exclaimed, while passing vainly from room to room, "well thank heaven, I have one of the rascals in limbo:" a stout looking fellow present, immediately slid out of the apartment, and for the present, was seen no more. The young Englishman tired at last with his search of the premises, determined to leave the house to look further elsewhere.—His foot was on the threshold of the door.—"Stop there you mister," exclaimed a tall Yankee, bringing a bayonet to a charge at his breast, "you dont come here and kidnap our citizens at that rate, I gues."

"Kidnap your citizens, why my good fellow that was a rascally deserter that I apprehended."

"Deserter or no deserter, we don't want no such doings over our side, and you don't budge from here my hearty, except to go before Gov. Cass."

"Gov. Cass? Why my dear Sir, I have a letter here for Gov. Cass, and am anxious to find him out in person."

It was "no go," however, as the sturdy yeoman said, and he and his comrades at once led our young and hasty adventurer to the residence of the Governor. Detroit was then a military post of the first distinction. The town was crowded with officers and their families, and on that very day there was a levee, at which three general officers, with their respective suites, received company at the Governors.—

The culprit was politely received by the Governor, and being soon drawn within a group of officers, they all heartily sympathized with him and agreed that they might, without thinking, have acted similarly in violating a foreign territory when sent after a scoundrel of a deserter. It was, in short, a mere matter of moonshine, and the young offender need give himself no concern about it, but fill his glass, and let the hour bring forth what it might. To make a long story short, however, our subaltern was soon ordered before the Governor, who in a totally altered manner explained the grave nature of his offence to him, and told him he must be handed over to the civil authority, adding, that if he did not like to go to jail, he might take up his residence in the fort, under the care of Captain O'Follon, whose politeness the English gentleman had already experienced, and under whose custody he was glad to place himself. His stay there he found far from disagreeable, and he spoke with warmth of the courtesy of the officers in walking out with him every day, and keeping up their necessary surveillance over his person in a manner that made it not at all unpleasant. The Grand Jury soon after found a bill against him for the crime of kidnapping "an American citizen, name unknown," and he was held to bail in the sum of \$2000, which was at once forthcoming from a gentleman on the Canadian side. The result of the trial was against the prisoner, but the United States subsequently quashed the proceedings of the Court, and set the culprit at liberty.

This relation, the particulars of which I have since found, are familiar to the old residents of Detroit, seemed from the unaffected yet animated manner in which it was made to strike every one present, and as you may imagine, our interest in the party chiefly concerned, was not a little heightened by our discovering the next morning, that the individual who had made himself so agreeable the evening before, was Captain Vidal of the British Navy, whose enviable reputation as the companion of Captain Owen in his recent arduous voyage of discovery along the coast of Africa, gives one the privilege of mentioning his name, as that of a public man. Capt. V. has just settled on a farm on the Canada side, but so near to Detroit that his society will be an acquisition to a neighborhood remarkable for its agreeableness and elegant hospitality.

I have made several excursions to different places in the vicinity of Detroit. The pleasantest ride perhaps is one along the river on the Canada side; from which Detroit appears to great advantage. Every thing looks dead, though in William IV's dominions, after coming from the bustling American town. The French there insist upon holding on to their acres, and being unwilling to improve their property, its value remains stationary. These French tenures have had their effect too, in retarding the growth of Detroit, and they still check in no slight degree, its advances in prosperity. The French farms are laid out along the river on both sides, with a front of only two or three acres on its bank, while they extend back into the country for half a dozen miles; a disposition of property very unfavorable to agriculture, and only adopted originally, to bring the colonists as near together as possible, for the sake of mutual protection against the Indians. Many of these farms now cross the main street of Detroit at right angles at the upper end of the town, and of course offer on either side a dozen building lots of great value. The original owners, however, persist in occupying them with their frail wooden tenements and almost valueless improvements notwithstanding large sums are continually offered for the merest slice in the world off the end of their longtailed patrimonies. They are a singular race of beings altogether. Mild and amiable, with all that politeness of manner which distinguishes every class of the courteous nation from which they derived their origin—they are still said to be profoundly ignorant. They call Detroit

"the Fort" to this day, and yet few of them know anything of the country whose soldiers first held it. They are good gardeners but very indifferent farmers, and their highest ambition is to turn out the fastest trotting poney when the carriage race commences on the ice at mid-winter. Some of them will own a hundred of these ponies, which, in defiance of snow and sun, run in the woods from one end of the year to the other. The fastest of the herd, which is generally a three minute horse, the owner will keep for himself, or if he parts with him, asks the purchaser two or three hundred dollars for his bargain, while from the rest, for twenty-five or thirty, he may select at pleasure. They are very easy gaited animals, carrying astonishing weights with ease, but their shoulders are so low it is difficult to keep an ordinary saddle on their backs with any comfort. But though generally rough misshapen looking creatures, some are very elegantly formed, and remind me often—while neither resembling the Arabian nor the English horse—of some French drawing I have seen of the spirited steeds of the Balkore, or the rushing coursers of the Ukraine. I am credibly informed that they are known to perform journeys under the saddle of 80 miles a day for 10 days in succession without being at all injured by it. They are thought to have a different origin from the Canadian horse, to which the best of them bears no particular resemblance except in size.

A race of horses might be raised from this hardy stock to vie in vigor and beauty with the magnificent pear trees which are here produced by grafting a delicate fruit upon the tough wild thorn of the country.

The drive to lake St. Clair must be very pleasant in summer judging from what I saw of it during a raw snowy day. The banks of this river are indeed rather low for beauty and the lake itself when you arrive at it, is only a large black sheet of clear water, but the thick set orchards of the French farmers coming quite down to the shore of the river, are pleasing objects in themselves, and with the green islands in the strait, the decaying windmills so frequently recurring along its shores, and the groups of shaggy ponies almost invariably grouped around their base, would enable a painter to eke out a very pretty landscape.

About ten miles from Detroit a United States Arsenal is now erecting, under the superintendence of Lieut. Howard, of the Army; for an introduction to whom I was indebted to two young officers, who rode out with me to visit the place. The day was cold and cloudy, like most it has been my lot to describe to you of late; but my companions were intelligent and agreeable, my horse free and sufficiently fast, and my reception at the end so satisfactory, that I still think of my ride along the lazy banks of the billious looking river Rouge with pleasure. The arsenal, though of brick, is by far the best specimen of masonry I have yet seen here. It is to be regretted, however, that for such a national work the appropriation by government for its erection had not been large enough to have permitted the beautiful Cleveland stone which form the lintels of its doors and windows to be substituted for the perishable-looking material of which the building is now constructed. The taste of Mr. H., which is already evinced by some arrangements in the vicinity, will no doubt induce him to preserve some hoary and fantastic-looking oaks, which cling their gnarled branches within a few yards of the walls, and which even now, stripped as they are of their foliage, are worth a whole forest of common ornamental shrubbery. The trees I have generally seen around our military posts look all as straight and martinet-like as if planted by a drill-sergeant. These veteran oaks stand upon a sloping bank, and as they are too crooked ever to catch the eye of the utilitarian, and to be sawed up into boards, they may, if not now molested, wave yet for a century above these ingenuous idlers who delight to—

—under the shade of melancholy boughs
Lose and neglect the creeping hours of time.

Too much praise can hardly be accorded to the activity of the officer, who, in five months, has reared such a building, and created the village which is already growing up around it in the midst of an unbroken forest. There is a capital tavern, a store, and

two or three dwellings, in the new town of "Dearbornville"—all built since last July. I sat down to dine on a fine haunch of venison, with the veteran General B— and his young Aid, who were together on a hunting expedition in the vicinity. Nothing could have impressed a stranger more favorably with military breeding, than the bland, paternal manner of the gentleman-like old officer to his four juniors present. The deer yet abound within a morning's walk of Detroit, the primitive forest standing untouched within a few hundred yards of the town, immediately in its rear. They are hunted daily at this season, and no slight sensation was made here a day or two since, by the prolonged absence of the General, who had been benighted and lost his way, upon one of these short excursions. The town was about to turn out en masse, when the re-appearance of the hunter, after two days' absence, relieved a very general anxiety.

The tedious length of this letter is sufficient apology for the abruptness with which I must break off.

H.
THE KNICKERBOCKER, for January. PEABODY & Co.—This—in so far as it is original, is a poor number—but its volume is chiefly made up of Mr. Verplanck's discourse before the Mechanics' Institute, which, though excellent, has appeared in another shape, and selections from English annuals, which have no business in an American Magazine purporting to be original.

AURUNGESE, OR A TALE OF ALRASCHID, 2 vols.—Philadelphia, CAREY, LEA & BLANCHARD.—Another novel of the East, setting forth the splendors and the crimes of that region of the sun, and depicting with a vigorous pencil, and, as cannot be doubtful, from personal knowledge, the gorgeousness of Indian scenery, the fierce and implacable feuds of Indian despots.

LA REVUE FRANÇAISE, No. 3. New York, HOSKINS & SNOWDEN.—There is much good reading in this number, which is, moreover, less inaccurate than its precursors in its typography, of the general execution and appearance of which, and of the Magazine generally, we have only to speak with praise. The account of an assault by a Paris mob in 1789, on the Hospital of Lazarus, is new to us, and well told.

THE MILITARY AND NAVAL MAGAZINE, for January. Washington: B. HOMANS.—We perceive we think—and it gives us pleasure—that the two services take a more decided interest in this periodical, dedicated so particularly to their amusement and instruction; under their auspices, and with the aid they can give, it must flourish.

The leading paper in this number, respecting the Navy, with suggestions for its improvement, is worthy of attention. We have heard before, what is broadly stated by this writer, that the efficiency of the Navy is retrograding; and viewing it as we do, as the great arm of our safety and defence, the 'decus et tutamen' of the nation, we would hope that any well considered suggestions for its improvement, may be operative in quarters where the power exists of giving effect to them.

The plan of a *Provident Society*, for the two services, which has been for sometime under discussion, is, as it strikes us, shown to be both unadvisable and impracticable, by the elaborate report of the officers stationed at West Point. Life Insurance Companies offer to officers of the Army and Navy, and all others, dependant upon a salary, the easiest and surest means, at the cost of a little present self-denial, to ensure some provision at their death for their families.

THE YOUTH'S SKETCH-BOOK. Boston: LILLY, WAIT & Co.—It is not yet too late, we hope, to express, as, but for the pressure of other matters, we should have done before, our admiration and approbation of this pretty little book, so well finished, embellished with so many engravings calculated to arrest the attention of young readers, and of which the contents, diversified by prose and poetry, and mostly original, are all of a nature to improve as well as to amuse. It is, too, handsome in appearance, as well as good in purpose and execution.

CONGRASSES.—The following were among the petitions, memorials, &c. called up during the week ending on Saturday last:—

Mr. Hazeltine, the petition of inhabitants of Chataugue Co., for an appropriation to construct a harbor at Portland, Lake Erie.

Mr. Seldon, of the Masters and Owners of Vessels navigating the Hudson, that a Light House may be erected at Leopold Creek—all which were referred to the Committee on Commerce.

Mr. Reed, of Mass., the petition of inhabitants of Nantucket for Buoys in Swash & Tuckanuck Shoals, heretofore presented; and Mr. Fillmore, of Richmond, Hargrave Lee.

Mr. Davis, of Massachusetts, a petition of Thomas Blanchard, of New York, praying that letters patent granted him for an invention of an engine for turning or cutting irregular forms may be renewed.

Mr. Turrill, a petition from inhabitants residing near Lake Ontario, for the construction of a ship Canal around the Falls of Niagara.

Mr. Hiester, for the construction of a steamboat navigation from Chesapeake Bay, up the Susquehanna River, Seneca Lake, and Oswego River, to Oswego; also a similar connection between Lake Michigan and the Illinois River; were referred to the Committee on Roads and Canals.

LEGISLATURE OF NEW-YORK.

January 9.—SENATE.

The President announced the following Standing Committees.

On Claims.—Messrs. Sudam, Tracy, and Fisk.

On Finance.—Messrs. Dodge, Van Schaick, and Halsey.

On the Judiciary.—Messrs. Lansing, Edmonds, and Edwards.

On the Militia.—Messrs. Foster, Maison, and Kemble.

On Canals.—Messrs. Hubbard, Armstrong, and Livingston.

On Rail-Roads.—Messrs. Edwards, Mack, and Maison.

Roads and Bridges.—Messrs. Westcott, Lynde, and Seger.

Literature.—Messrs. Van Schaick, Gansevoort, and Bishop.

State Prisons.—Messrs. McDonald, Seward, and Foster.

Banks and Insurance Companies.—Messrs. Edmonds, Stower, and Armstrong.

Division of towns and counties.—Messrs. Cookling, Fisk, and Mack.

Agriculture.—Messrs. Halsey, Cropsey, and Griffin.

Manufactures.—Messrs. Quackenbush, Cary and Bishop.

Privileges and Elections.—Messrs. McDowell, Westcott and Dodge.

Enrolled Bills.—Messrs. Lynde, Hasbrouck and Seger.

Indian Affairs.—Messrs. Seward, Conkling and Kemble.

Expiring Laws.—Messrs. Tracy, McDowell and Cropsey.

On Expenditures.—Messrs. Stower, Griffin and Quackenbush.

Incorporation of Cities and Villages.—Messrs. Gansevoort, Birdsall and Livingston.

On the Governor's Message.

On the Boundary line between New Jersey and New York.—Messrs. Sudam, Lansing and Livingston.

Relative to the Deaf and Dumb.—Messrs. Birdsall, Dodge and McDowell.

On the Asylum for the Blind.—Messrs. Cropsey, Cary and Hubbard.

On the Asylum for the Insane.—Messrs. Hasbrouck, Lansing and Edmonds.

On Salt.—Messrs. Edwards, Mack and Gansevoort.

County Poor Houses.—Messrs. Fisk, Seward and Westcott.

The Senate then adjourned.

Saturday, Jan. 11.—IN ASSEMBLY.

The Speaker announced the following committees.

Ways and Means.—Wheeler, Myers, Clark, A. J. Parker, Cash.

Grievances.—Anderson, De Graw, Livingston, Healey, Sumner.

Privileges and Elections.—Brasher, Dusenbery, Williams, Mabbett, Terry.

Judiciary.—Haight, Phelps, Gordon, Grinnell, Clary.

Expiring Laws.—Bagley, Martin, Watt, Collier, Harris.

Claims.—Ingalls, Fox, Crosby, Robertson, Cuykendall.

Colleges, Academies and Common Schools.—M'Kean, Begardus, Beardslee, Schermerhorn, Yates.

Engrossed Bills.—Jackson, Case, Hall, Conklin, Nichols.

Erection and Division of Towns and Counties.—O. Robinson, Butrick, Wheaton, Orr, Kingman.

Incorporation of Cities and Villages.—Drake, Wright, Bull, Stone, Enos.

Agriculture.—Kernon, Morehouse, Woods, Temple, Dyer.

Incorporation of Charitable and Religious Societies.—Cargill, Stroug, M'Knight, Bockhoven, Young.

Incorporation and Alteration of Banking and Insurance Co's.—Morris, Willes, Younglove, Bowne, Smith.

Aliens.—Osborne, Ringgold, Chamberlain, Arnold, Lewis.

Canals and Internal Improvements.—Humphrey, Strong, Stevenson, Morrill, West.

Roads and Bridges and the Incorporation of Turnpike Companies.—Angel, Stafford, Campbell, Mabet, Fleming.

State Prisons and Penitentiary System.—Staats, Gordon, Lockwood, Groom, Harkhurst.

Militia and the Public Defence.—Fowler, Tompkins, Ruggles, Ward, Germond.

Indian Affairs.—Snyder, Jones Mitchell, Patterson, Hanbrouck.

Manufacture of Salt.—Strong, Guinnip, Wright, Osborne, Boatwick.

Medical Societies and Colleges.—Winfield, Staats, Stevenson, Anthony, Palmer.

Two Third Bills.—Tompkins, Haight, Archibald, Johnson, Lefever.

Public Lands.—M'Knight, J. P. Robinson, Hunt, Myrick, Grover.

Trade and Manufactures.—Myers, Hough, Barnes, J. B. Parker, Spafford.

Railroads.—Beardsley, Todd, J. H. Parker, Shays, Coe.

Select Committees on the Governor's Message.

On so much as relates to Poor Houses.—Marvin, Culver, Church, Whipple, Emmons.

On so much as relates to Insane Poor.—A. J. Parker, Titus, Dana, Sears, Thompson.

On so much as relates to the Deaf and Dumb.—Hertell, Brasher, Elithorp, Mercereau, Brown.

January 7.—IN SENATE.

Documents accompanying the Governor's Message.

Copy of a letter from the Commissioners appointed to settle the boundary between New York and New Jersey.

NEW YORK, OCT. 20th, 1833.

Sir:—We have the honor to inform you that pursuant to our appointment under the act concerning the territorial limits and jurisdiction of the State of New York and the State of New Jersey, passed January 18th, 1833, and after several conferences with the Commissioners appointed under a similar law of the State of New Jersey, we have concluded an agreement for the purpose of settling the boundary referred to in those acts.

We deem it unnecessary to enter into a detailed account of the course of the negotiation, and will only observe in respect to it, that waiving all discussion of the strict rights of either party, the Commissioners on both sides made such concessions as they supposed to be not only compatible with the substantial interests of each of the States, but conducive to the harmony and welfare of both. Proceeding upon these principles, it will be seen that the middle of the waters which divide this State from New Jersey has been agreed upon as the line of property, with such variations as to include within this State the islands belonging to it; and that this is also to be the line of jurisdiction, except where circumstances render a departure from it proper. This was peculiarly the case with respect to the waters adjacent to the city of New York, and we trust that the jurisdiction necessary for the health, improvement, and police of that city has been amply secured, and that the agreement herewith delivered to you will be satisfactory to the Legislature and to our fellow-citizens generally.

We are, Sir, with high respect, your obedient servants,

B. F. BUTLER,
PETER AUGUSTUS JAY,
HENRY SEYMOUR.

To His Excellency Wm. L. MARCY,
Governor of the State of New York.

Agreement made between the Commissioners on the part of the State of New York and the Commissioners on the part of the State of New Jersey,

relative to the boundary line between the two States.

Agreement made and entered into by and between Benjamin F. Butler, Peter Augustus Jay and Henry Seymour, Commissioners duly appointed on the part and behalf of the State of New York, in pursuance of an act of the Legislature of the said State, entitled "An act concerning the territorial limits and jurisdiction of the State of New York and the State of New Jersey," passed January 18th, 1833, of the one part, and Theodore Frelinghuysen, James Parker and Lucius Q. C. Elmer, Commissioners duly appointed on the part and behalf of the State of New Jersey, in pursuance of an act of the Legislature of the said State, entitled "An act for the settlement of the territorial limits and jurisdiction between the States of New Jersey and New York," passed February 6th, 1833, of the other part.

ARTICLE FIRST.—The boundary line between the two States of New York and New Jersey, from a point in the middle of Hudson river opposite the point on the west shore thereof, in the forty-first degree of north latitude, as heretofore ascertained and marked, to the main sea, shall be the middle of the said river, of the bay of New York, of the waters between Staten Island and New Jersey, and of Raritan bay, to the main sea, except as hereinafter otherwise particularly mentioned.

ARTICLE SECOND.—The State of New York shall retain its present jurisdiction of and over Bedlow's and Ellis' islands, and shall also retain exclusive jurisdiction of and over the other islands lying in the waters above mentioned, and now under the jurisdiction of that State.

ARTICLE THIRD.—The State of New York shall have and enjoy exclusive jurisdiction of and over all the waters of the bay of New York, and of and over all the waters of Hudson river lying west of Manhattan Island, and to the south of the mouth of Spuyten-duyvel creek, and of and over the lands covered by the said waters to the low water mark on the westerly or New Jersey side thereof; subject to the following rights of property and of jurisdiction of the State of New Jersey, that is to say:

1. The State of New Jersey shall have the exclusive right of property in and to the land under water lying west of the middle of the bay of New York and west of the middle of that part of the Hudson river which lies between Manhattan Island and New Jersey.

2. The State of New Jersey shall have the exclusive jurisdiction of and over the wharves, docks and improvements made, and to be made, on the shore of the said State, and of and over all vessels aground on said shore, or fastened to any such wharf or dock; except that the said vessels shall be subject to the quarantine or health laws, and laws in relation to passengers, of the State of New York, which now exist or which may hereafter be passed.

3. The State of New Jersey shall have the exclusive right of regulating the fisheries on the westerly side of the middle of the said waters, provided that the navigation be not obstructed or hindered.

ARTICLE FOURTH.—The State of New York shall have exclusive jurisdiction of and over the waters of the Kill Van Kull, between Staten Island and New Jersey, to the westernmost end of Shooter's Island, in respect to such quarantine laws and laws relating to passengers as now exist or may hereafter be passed under the authority of that State, and for executing the same; and the said State shall also have exclusive jurisdiction, for the like purposes, of and over the waters of the Sound, from the westernmost end of Shooter's island to Woodbridge creek, as to all vessels bound to any port in the said State of New York.

ARTICLE FIFTH.—The State of New Jersey shall have and enjoy exclusive jurisdiction of and over all the waters of the Sound between Staten Island and New Jersey lying south of Woodbridge creek, and of and over all the waters of Raritan bay, lying westward of a line drawn from the light house at Prince's bay to the mouth of Mattavan creek, subject to the following rights of property and of jurisdiction of the State of New York.

1. The State of New York shall have the exclusive right of property in and to the land under water, lying between the middle of the said waters and Staten Island.

2. The State of New York shall have the exclusive jurisdiction of and over the wharves, docks and improvements made and to be made, on the shore of Staten Island; and of and over all vessels aground on said shore, or fastened to any such wharf or dock, except that the said vessel shall be subject to the quarantine or health laws, and laws in relation to passengers of the State of New Jersey which now exist, or which may hereafter be passed.

3. The State of New York shall have the exclusive right of regulating the fisheries between the shore of Staten Island and the middle of the said waters, provided that the navigation of the said waters be not obstructed or hindered.

ARTICLE SIXTH.—Criminal process issued under the authority of the State of New Jersey, against any person accused of an offence committed within that State; or committed on board of any vessel being under the exclusive jurisdiction of that State as aforesaid; or committed against the regulations made or to be made by that State, in relation to the fisheries mentioned in the third article; and also civil process issued under the authority of the State of New Jersey against any person domiciled in that State, or against property taken out of that State to evade the laws thereof; may be served upon any of the said waters within the exclusive jurisdiction of the State of New York, unless such person or property shall be on board a vessel aground upon, or fastened to the shore of the State of New York, or fastened to a wharf adjoining thereto; or unless such person shall be under arrest, or such property shall be under seizure, by virtue of process or authority of the State of New York.

ARTICLE SEVENTH.—Criminal process issued under the authority of the State of New York, against any person accused of an offence committed within that State; or committed on board of any vessel being under the exclusive jurisdiction of that State as aforesaid; or committed against the regulations made or to be made by that State, in relation to the fisheries mentioned in the fifth article; and also civil process issued under the authority of the State of New York, against any person domiciled in that State, or against property taken out of that State to evade the laws thereof; may be served upon any of the said waters within the exclusive jurisdiction of the State of New Jersey, unless such person or property shall be on board a vessel aground upon, or fastened to the shore of the State of New Jersey, or fastened to a wharf adjoining thereto; or unless such person shall be under arrest, or such property shall be under seizure, by virtue of process or authority of the State of New Jersey.

ARTICLE EIGHTH.—This agreement shall become binding on the two States when confirmed by the Legislatures thereof respectively, and when approved by the Congress of the United States.

Done in four parts (two of which are retained by the Commissioners of New York to be delivered to the Governor of that State, and the other two of which are retained by the Commissioners of New Jersey, to be delivered to the Governor of that State,) at the city of New York, this sixteenth day of September, in the year of our Lord one thousand eight hundred and thirty-three, and of the Independence of the United States the fifty-eighth. (Signed.)

B. F. BUTLER, THEO. FRELINGHUYSEN,
PETER AUGUSTUS JAY, JAMES PARKER,
HENRY SEYMOUR, LUCIUS Q. C. ELMER.

IN ASSEMBLY.—Friday, Jan. 10.

Bill introduced on notice.

By Mr. Myers, for the better security of steamboat passengers—referred to a select committee, and double the usual number of copies ordered. The bill provides that three steamboat inspectors shall be appointed for two years by the Governor and Senate for each of the cities of New York and Albany; whose duty it shall be to direct the peculiar construction of steam boats intended to navigate the Hudson, so as most effectually to guard against the bursting of boilers—to inspect all such boilers previous to their being placed on board—to examine as to the competency of the engineers now, or hereafter to be employed—to ascertain once every two months, during the season, the condition of the boilers and machinery of every boat, and examine minutely into the causes of every explosion:—Also, that no boat shall be permitted to carry passengers on the Hudson, without having been examined by two inspectors (any one of whom may prohibit the conveyance of passengers by any boat which he may judge to be defective in boilers or machinery,) nor unless the engineer shall have submitted to an examination and received a certificate of qualification. Penalty for navigating the Hudson without obtaining the certificate of the two inspectors, \$500 for each offence; and for employing an engineer who has not complied with the requisitions of the act, \$50 for each day he may be so employed. Fees of commissioners \$5 each per diem while on duty; to be paid by the person employing; and \$5 for each engineer's certificate. Each boat is to be reported by the captain, and registered, for which he shall pay \$2 50. Tow boats not included in the act. Racing prohibited on penalty of forfeiture of boat, machinery, &c.

LATEST FROM BUENOS AYRES.—We have been favored by a friend with the perusal of a letter from a gentleman in Buenos Ayres, to his friend in this city, dated the 8th of November, from which we learn that the insurrection, of which our last previous accounts made mention, is at an end, and tranquillity restored.

It appears that popular discontent rose so high that vast numbers of citizens abandoned Buenos Ayres, and repaired to the outside party, which soon amounted to 7000 men, well armed, whilst the government had only about 500 men, very badly mounted. In this state of things Gov. Balcarce addressed a note to the legislature, soliciting their advice. They returned an answer somewhat equivocal, but containing an oblique hint to resign. He rejoined, and said "he was resolved to abide by their advice, and even to resign, if their honorable body thought it advisable."

Without waiting for further formality, the Legislature immediately voted to consider his suggestion as a resignation—and addressed another note to his Excellency, acquainting him that they had accepted his resignation! They next proceeded without loss of time to elect a new Governor, when General Viamont received 17 votes, and General Pinto, the Speaker of the House, 12. The former being declared elected, was ordered to appear before the House immediately, to make the usual oath, which he did at once, and entered upon the active duties of his office. Having taken possession of the fort, he despatched a communication to General Piendo, the head of the insurgents, informing him of the state of things in the city, and received for reply that the armed citizens without the walls rejoiced at the election of General Viamont, and would cheerfully yield obedience to any commands that he might issue.

The next day about one hundred officers of Balcarce's party went off to the schooner of war Sarandi, and having made Capt. Wilder prisoner, got her under way and decamped. The Captain wrote back to the Captain of the port, stating that he was a prisoner, and that the officers required him to land them at Colonia—on the Banda Oriental. It was expected that the vessel would be returned. On the 7th of Nov. about five thousand of the outside troops entered the city and marched to the Plaza de la Victoria, where they saluted the new Governor, and after making a grand display those of them who were soldiers repaired to their respective quarters, and the citizens to their houses and avocations. "Our present Governor, says the letter, is an old patriot, universally beloved, and one who, though firm, is inclined to peace. The selection which he has made for his ministry cannot be better—Garcia for finances and government, and Gen. Guide for War and Foreign Affairs. Gen. Mancilla, Chief of Police, Gen. Pinedo, Inspector General, and Col. Espora, Captain of the Port. Thus has ended the most systematic and orderly revolution which has ever taken place. I call it a revolution because a legitimate government has been compelled to abdicate by the torrent of public opinion, and we are now likely to enjoy the sweets of peace for some years to come."—[Com. Adv.]

The idea of the annexed dialogue, which is of course supposititious, is clever—and it is cleverly carried out:

DIALOGUE BETWEEN CAPTAIN ROSS AND CAPTAIN HUMPHREYS.

[From the Leeds Mercury.]

Capt. R.—I have been thinking, Humphreys, what Lord Melville, and Croker, and my old enemy, Barrow, will say to my discoveries. I have prepared despatches for the Admiralty at least ten times, sealed them firmly, and enclosed them in a wooden box, in the hope that they might be found if I perished.

Capt. H.—Lord Melville and Croker are out long since. Sir James Graham is First Lord now.

Capt. R.—What, Sir James Graham? Of course it is not the radical member from Cumberland, who makes the motions about sinecures.

Capt. H.—The very same, and as stingy in office as he was snarling out. Even the King, though so fond of the service, can't stop his pruning and lopping.

Capt. R.—The King! why I thought he preferred the army, and neglected the navy.

Capt. H.—Ah! I forgot to tell you. Old George has gone. We've now William IV. The Duke of Clarence that was.

Capt. R.—Indeed! What sort of a King does he make? Is he a strict disciplinarian? I hope he has not infringed on the liberties of the people, nor ordered Brougham and Denham, who abused him so at the Queen's trial, to be strung up at the yard-arm.

Why, what a horrible renegade Sir James Graham must be! I wonder the Duke would take him in.

Capt. H.—The Duke! Brougham! and Denham! renegade! strict disciplinarian! Ah! my good fellow, you are a thousand leagues out of your reckoning: we've changed the poles of the earth since you left us.

Capt. R.—I hope you've not had a revolution?

Capt. H.—Oh no, but we've had Reform.

Capt. R.—What! Has Lord John Russell carried his motion to give members to Manchester, Leeds, and Birmingham? Did the Duke and Peel consent?

Capt. H.—The Duke has been turned to the right about three years since. Earl Grey and the Whigs are now in office.

Capt. R.—Is it possible! Grey is a fine fellow, but rather proud of his order. However you say reform is carried. How do Grey and the boroughmongers go on together?

Capt. H.—Just as the dog Billy and the hundred rats did. He has worried them every one—there is no such thing as a boroughmonger in the Kingdom—they have all gone to Davy's locker.

Capt. R.—You make game of me. Why, what has become of the Tory majorities of Parliament?

Capt. H.—Reduced to a miserable minority in the Commons, and kept in decent order in the Lords.—All the large towns have representatives. The rotten boroughs are annihilated. The King turned Reform, and then it was up with the Tories.—The Reformed Parliament has emancipated the West India slaves, opened the China trade, and reformed the Irish Church.

Capt. R.—You tell me miracles. Pray have the Whigs found out a way to pay off the National Debt?

Capt. H.—No, that and the North West Passage will be discovered together.

Capt. R.—But tell me, has the King forgiven Brougham and Denham?

Capt. H.—Judge for yourself, the first is a Lord, and keeps the King's conscience; the second is Lord Chief Justice of the King's Bench.

Capt. R.—Good Humphreys! tell me next, do people walk on their hands or their feet now in England?

Capt. H.—The fashion had not changed in that respect when I sailed; but what think you of their travelling at the rate of thirty knots an hour—a hundred people or so drawn by one engine!

Capt. R.—Now, Humphreys, don't bounce; no tricks upon travellers; you, at home, are turning Munchausens now.

Capt. H.—As I live, its true; the Duke of Orleans went the other day from Liverpool to Manchester in an hour and five minutes.

Capt. R.—The Duke of Orleans! I hope the French have not invaded us; yet old Charles X. must have hated the English Reform.

Capt. H.—To be sure he did; he was running as fast as possible the other way, that is, towards pure despotism; so the French capsize him, and put his cousin the Duke of Orleans at the helm. They call him Louis Philip, and he makes a moderately good King, and keeps the French quiet, though the Liber-

als say he does not go far enough. His daughter married Leopold.

Capt. R.—Prince Leopold, you mean; do they live in England then?

Capt. H.—Prince Leopold! No, lack-a-day, one has to teach you the whole alphabet over again. King Leopold—King of Belgium; that is a new kingdom sprung up, separated from Holland; the Belgians did not like playing second fiddle to the Dutchman, so they mutinied, and chose a captain of their own, and they've got our Prince Leopold.

Capt. R.—And what said the Holy Alliance to that?

Capt. H.—Said! Why, Nic was beginning to be saucy, and talked of sending an army to France; but the Poles revolted, and it took a twelvemonth to lick them; they fought like lions, but what signified that when they were surrounded by such a set of devils? At last Nic got them down, and then he cut their throats. As to Austria and Prussia, they did not like the look of things, as the Frenchmen were clearing for action, and calling all hands on deck. So they thought it better to sheer off.

Capt. R.—You take away my breath. I can't receive all this at once, and I fear you're bouncing, Humphreys, or else the world has turned topsyturvy, whilst I have been locked up in ice these four years, almost as fast as a block of freestone. I thought if any body had climbed to the top of the tree in England, it would have been Huskisson.

Capt. H.—Poor Huskisson! he's gone; he was run down by an engine at the opening of the Liverpool railway, and killed.

Capt. R.—Horrible! I am almost afraid to ask who is alive. But tell me, how is my old neighbor —, and his daughter; a pretty little girl just left school.

Capt. H.—Little girl! She is Mrs. —, and has a fine boy a year old.

Capt. R.—You don't say so: the chit! Well, I see the world's going on the old principle still; but every thing seems to be done quicker in England than it used to be. What is Walter Scott's last tale?

Capt. H.—Ah! He has told his last; we have got to the Finis: the bright star has set. But I have news for you—the course of the Niger has been discovered.

Capt. R.—Who is the lucky man?

Capt. H.—Two young chaps called Lander; one of them was the attendant of poor Clapperton.—They are well behaved, steady lads, and they have done what so many fine fellows perished in attempting. They have traced the river to the Bight of Benin. One of them has gone out again, and it will be well if the dysentery does not catch him this time.

Capt. R.—(Sighing) I was not born under so fortunate a star. But I have done what man could do, and suffered more than most. Even Barrow will confess that.

Capt. H.—Every body will confess it. Cheer up man, you have solved the problem one way at least: you could not find a passage where there was none. Four winters in the ice is what no man ever endured before. The world will give you every credit for bravery, perseverance, and skill, not to be outdone.

Capt. R.—Do you think so?

In December, the observations of winds from the North-Eastern quarter, were 791—from the South-Eastern, 1—from the South-Western, 23—from the North-Western, 431.

The observations of the direction of clouds or higher currents, for the same month, were as follows: From the North-Eastern quarter, 28—from the South-Eastern, 1—from the South-Western, 534—from the North-Western, 251.

Maximum of the barometer 30.50 in.—Minimum, 29.50 in.—Range, 1. in.

* The snow storm of the 14th commenced at Baltimore at half past eleven on Saturday morning, and at Philadelphia at 4 o'clock in the afternoon, and continued about the same length of time as here.

† The storm of the 17th, as well as that of the preceding Saturday, commenced somewhat earlier at the south and later at the eastward than usual; or, in other words, the progress of these two storms from south-west towards the north-east was slower than the average of other storms. The storm of the 17th is said to have been near twenty-four hours in travelling from New-York to Portland.

The common notion that the violent westerly wind which commonly succeeds an easterly gale is an opposing or antagonist wind, forcing back the easterly gale, is disproved by the facts attending the gale of the 17th, which, in this part of the country, exhibited no change to the westward—the wind continuing to blow from the north-eastern quarter till long after the gale had passed beyond the eastern limits of the United States. Such facts can be satisfactorily accounted for only by admitting the circuitous or whirlwind character of these storms.

GRACIE, PRIME & CO. having this day taken into co-partnership JOHN CLARKSON JAY, will continue their business under the same firm.—New-York, 1st October, 1833.

FOR SALE.

ATLANTIC JOURNAL AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Rafinesque, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. dedicated to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 100 plates, containing also the economical properties of 300 genera of American plants, \$3.

MANUAL OF AMERICAN VINES, and Art of Making Wines, with 8 figures, 25 cents.

FISHES AND SHELLS OF THE RIVER OHIO, 1 dollar.

AMERICAN FLORIST, with 36 figures—price 36 cts.

** Orders for these works, or any other of Professor Rafinesque's, received at this office. A9 J M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon-dale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, {

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 5th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means. S1 R J M M & F

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 18, 1833. A29 d RM & F

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his caveats filed in the Patent Office. Apply, post paid. S1 R J M M & F

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as un mindful of safety. Apply, post paid. S1 R J M M & F

ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated. Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzell, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber.
D. K. MINOR, 35 Wall street.
New-York, August 14, 1833.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

AGRICULTURAL WAREHOUSE AND SEED STORE.

No. 81 Barclay street.

H. HUXLEY & CO., Produce Brokers, offer their services in selling and buying all kinds of Country Produce, and Farming and Gardening Implements.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bloecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, cake, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company. WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 72 of this Journal.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.
J 31 81

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested:—

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee with the following information: The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as much most cheerfully recommend it to Engineers and Surveyors.
E. H. GILL, Civil Engineer.

German town, February, 1833.
For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
German and Norman Railroad.

RAILWAY IRON.

				Flat Bars in lengths of 14 to 16 feet, counter sunk holes, ended at an angle of 45 degrees with splicing plates, nails to suit.
Ninety-five tons of 1 inch by 1/2 inch,	300	do.	1 1/2 do.	do.
40	do.	1 1/2 do.	do.	do.
800	do.	2 do.	do.	do.
800	do.	2 1/2 do.	do.	do.
soon expected.				

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

The above will be sold free of duty, to State Governments, and Incorporated Governments, and the Drawback taken in part payment.
A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and flued to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Heartte.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JANUARY 25, 1834.

SAFETY APPARATUS FOR STEAM BOILERS.—

An apology is due to several of our esteemed correspondents for the delay which has occurred in the publication of their communications. That of Lieut. A. C. Twining and of J. S. Williams, Esq. of Cincinnati, Ohio, were received a long time since, but have been delayed by my absence and a desire of giving another communication upon the same subject, in the same number of the Journal. It is not, however, in readiness, and we will not longer delay those which have been so long in hand.

The communication of Mr. J. N. Pomeroy, describing a new mode of constructing vessels, has also been some time in hand. It is, indeed, as he observes, "as a water craft entirely unique," and as such, we submit it to the observation of the public.

At a meeting of the Stockholders of the LAKE ERIE AND MAD RIVER RAILROAD COMPANY, held, as we are informed, at Urbana, January 9th, 1834, it being ascertained that more than five thousand shares had been subscribed, they proceeded to the election of officers, when the following gentlemen were duly appointed :

President—Joseph Vance.

Directors—Horatio G. Phillips, Pierson Spining, John C. Pearson, Benjamin M. Platt, William Townsend, Charles G. Swain, Jonathan Harshman, Charles Cavileer, John H. James, Josiah Hedges, James Hollister, and John G. Camp.

Treasurer—John H. James, of Urbana.

Secretary—Jeremiah Warder, Springfield.

Committees were appointed to take such other measures as they may deem proper to cause the subscriptions of stock to be filled, to employ a competent engineer for the final location of the road, to commence on the first day of May, and so soon as 800,000 dollars shall be taken, the work is to be put under contract, from Day-ton to Urbana, and from Portland to a point 40 miles south, and beyond Tiffin.

MR. BURDEN'S STEAMBOATS.—It is said that a company of gentlemen in Albany have purchased of Mr. Burden the exclusive right to use steamboats made after his model, for the conveyance of passengers upon the Hudson river. Mr. B. reserves to himself the privilege of using his boats on the Hudson for freighting and towing.

However great may be the improvement which Mr. Burden had made in the construction of boats to be propelled by steam, we think further progress in the art will yet be exhibited. Mr. Langdon, of West Troy, has already a model of a boat prepared, which promises fair to outstrip Mr. Burden's. While it combines all the requisites which B.'s plan furnishes for obviating the resistance of fluid through which it passes, it also possesses the additional advantage of a greater buoyancy. It may also be constructed at a less expense, and does not appear so likely to get out of repair. We shall not be surprized to see it rank before Mr. Burden's, both as to speed and safety.—[Troy Budget.]

The following extract is taken from a London paper :—

Application is intended to be made in the ensuing session for a bill "to authorize in the constructing, improving, and using ten feet in width of the carriage way, or waste ground on the side of the carriage way, of the turnpike roads from Islington, in the county of Middlesex, to the town of Birmingham (being part of the several roads constituting the Holyhead mail-coach road between those places) into a hard and solid road, for the passing or travelling thereon of locomotive steam carriages;" comprising also powers to levy and collect tolls upon such carriages, and to apportion them between the trustees or proprietors of the said roads, and the persons who shall be authorized to construct such intended steam carriage road, and to alter and increase the tolls, rates, &c. authorized by the various acts at present in force.

RAILROAD, GERMANY.—The subscription for the intended railroad between Nuremberg and Furth amounts already to 130,000 florins.

Our "highly esteemed correspondent," the writer of the following extract and communication, need not be at all apprehensive that his communications will be omitted "agreeably to the law (of editors) in such cases made and provided" in consequence of a "press of other matter"—especially if they should have the same, hereafter, to recommend them as those already received: they will always find a place in the Journal. We cannot, however, forbear to publish the following extract from his letter by way of showing his philosophy, and at the same time recommending it to those who may have occasion to exercise it.

"I am sorry that I could not have furnished you with an article less prolix, and more worthy of the Journal; but you need not hesitate at declining to use it. You have only, "agreeably to the law (of editors) in such case made and provided," to express your "profound regret, that the press of other matter, &c. &c. obliges you to omit the publication of the communication of your highly esteemed correspondent, &c. &c. &c.—and this, you know, applies the anodyne to all wounds of this kind."

On the Petrifying of Wood, as applicable to Timber for Railroads, &c. By G. [For the American Railroad Journal and Advocate of Internal Improvements.]

Some time since, in an eastern paper, there appeared an article stating that some person had discovered a method of completely petrifying wood, and so preserving it nearly, or quite indestructible, by saturation with HYDRATE OF LIME. If any of your correspondents can furnish any information of the process; or any facts which may elucidate the subject, perhaps they might render an important service to the cause of railroads, in situations which require or admit the use of wood; and I would respectfully suggest to any who may recollect such facts, that the communication of them to the Railroad Journal would be a gratification to at least one of its readers—probably to many.

It is said that timber imbedded in lime, under certain circumstances, as, for instance, the ends of beams inserted in the walls of brick houses, decays sooner than in the open air—becomes dry rotten, &c. I have heard it argued that this is owing to the causticity, or some other quality of the lime; and to prevent the effect, it has been a practice, in some cases, to leave a space for the ends of the beams, large enough for the free circulation of air around them, and free from contact with the lime used in the construction of the walls. Whether the facts ob-

served in these cases fully justify the conclusion that time is always, or ever, injurious to the durability of the timber, I would not venture to assert, and it is not my purpose now to inquire. I am willing to admit the conclusion that it *may* be so in some cases; but I would suggest the inquiry whether its causticity may not be so completely destroyed by saturation with water, and in this state whether wood may not be so far impregnated with it as to become much more durable, and perhaps next to indestructible.

The notice mentioned at the introduction of this article, if it may be relied on as fact, answers the inquiry in the affirmative. Of the fact, however, I am ignorant, and therefore it is that I make this communication and inquiry. My object is to excite others to further investigations, and with this end in view, I beg leave to state some facts of which I have been informed, which seem to me to prove sufficiently, that lime may, in some situations, be made to contribute very essentially to the durability of wood; and, perhaps, may suggest a remedy, to some important extent, for the disadvantages to which wooden railroads are obviously liable.

Some years ago, I was travelling on the sea-coast of Maine, and put up for a night at the house of an elderly gentleman, who had been all his days concerned in ship-building and navigation, and appeared to be a sensible, shrewd observer. He had, that day, a new vessel arrived from her first voyage to a foreign port, and among other circumstances was told that she had not leaked a *drop* during the voyage. This led me to remark that she must have been exceedingly well built. He replied that he thought the tightness of the vessel was owing, in a measure, to the *lime* with which she had been stuffed while building. He had been led to believe that lime was a better preservative of the timber of ships than salt, or any other substance heretofore used for that purpose. While this vessel was being built, and before ceiling up the inside, he had the interstices of the timbers filled with new stone lime, pounded fine enough to be driven in between the timbers, and rammed in as solid as was possible in that state; the planking was then finished, and the lime left to slake and fill the remaining interstices. His theory was, that the air, and the moisture of the wood, and perhaps a little water, which might be expected to leak into the best built vessel, would slake the lime so that its expansion would fill every chink in the timbers, and penetrate the pores of the wood itself, sufficiently to prevent speedy decay; but any effect in rendering the vessel more staunch he had not anticipated. He, however, concluded that the expansion of the lime, though, from its small quantity, not sufficient to injure the vessel by its mechanical force, yet had been sufficient, by the addition of the little water which had leaked in, to form a mass of mortar so solid as to prevent, at least in some degree, the further ingress of water from without. This, however, was a new idea, and the present experiment was not conclusive; but as to its effect in preserving the timber, he had no doubt; and he related several facts in his own knowledge in support of this opinion.

As one instance, he stated that he had once owned a coasting vessel, built of the common timber of the coast of Maine, which, when nearly new, was once bound from Thomaston to Boston, with a cargo of lime, and on her passage went ashore somewhere between Cape Ann and Boston, and bilged. The lime slaked, burnt the deck and upper works, and, as might be expected, penetrated the timbers throughout. The vessel was unloaded, repaired, and lived, I think he said, thirty or forty years after this event; had undergone occasional repairs since, but the principal part of the original timber remained. When, after that time, examined, it was found that the original timbers, which had been impregnated with the lime, were *perfectly sound*, while those which had been added *since* that time, were all, or nearly all, *rotten*. He adduced, also, the

fact that vessels employed in carrying lime, generally, if not always, last longer than any others; and said that he had resolved thereafter to saturate, as far as possible, all his vessels with lime, as the best method of preserving them from decay.

Another instance was that of a parcel of pine planks which had been used as a platform, on the ground, on which to make lime mortar. This platform was laid by his grandfather, in a corner of the yard, and used more or less every year for the purpose of a "mortar bed." His father continued it in the same use; himself, the grandson, continued it for a time, as long as he had occasion; after which, it lay some years unused, and overgrown with grass and weeds; at length, wanting the ground for another purpose, he had it torn up and removed, expecting to find the planks entirely rotten—but, to his surprise, found them sound, and, to use his forcible expression, "as hard as a bull's horn." This was after they had lain in contact with the surface of the ground, exposed to all the vicissitudes of the atmosphere, I think he said, *about sixty years!*

It is now near 15 years since I received these accounts from the old gentleman, and I have never seen him since: my recollection, therefore, may not be perfectly accurate in the details of his statements, but of their *substance* I feel certain. When I saw the notice referred to in the beginning of this article, respecting the preservation of timber by means of hydrate of lime, these facts at once recurred forcibly to my mind, and I was led to the inference that, in the cases mentioned, there had been so much water present as to destroy the *caustic* properties of the lime, convert it to a *hydrate*, and hold so much of it in solution, and in such a situation, as that it might always be presented to the wood for its absorption, until it had become entirely saturated, and the wood thus effectually preserved.

Will some of your correspondents recollect, and furnish for publication in the Journal, such facts as may confirm or correct this inference, and trace out its legitimate consequences if confirmed? G.

Safety Apparatus for Steam Boilers. By ALEX. C. TWINING. To the Editor of the American Railroad Journal.

SIR,—I have read several interesting articles in your Railroad Journal, the object of which was to propose one plan and another for protecting steam boilers against that danger of explosion which arises from the exposure of the flues to a violent heat when the water is permitted to descend below them. Respecting this hazard, (which is of frequent occurrence, as any man may be satisfied who takes time and pains to make extensive inquiries, and concerning which I speak reflectively when I express the opinion that it subjects the traveller to more multiplied and more fearful risks than any other circumstance attending the steam engine,) there can scarcely be too much discussion, until some adequate means of public safety in relation to it shall have been discovered and brought into common use. In this article I design to add one more to the proposed expedients for safety, after bringing up to view one or two principles which are necessary to a clear understanding of the precise object before us, and which are often overlooked by those who discuss this subject.

It is a principle, or, at least, it is a truth, which ought to take the place of a principle, not to be lost sight of on this subject, that mechanism, ever so excellent, cannot be made to supersede the practice of that same strict and personal examination by means of the gauge-cocks, which is now enjoined upon the engineer and other attendants of the engine. The propriety of this assertion will be understood by every one who is practically acquainted with the imperfection of materials, and knows that machines, put together according to the best rules of art and maxims of science, are subject, nevertheless, to irregularities, which, in

mechanism for this purpose, though they occur but once in many years of time, do entirely prostrate the whole design. Nothing can be more simple, as a security against excess of steam in the boiler, than the present safety valve; yet, simple as it is, no one ventures to rely upon it without the attendant indications of the mercurial gauge; and if any arrangement equally simple shall ever be devised to meet the object now in question, as it is very probable there may, no wise man will rely upon it without the attendant indications of the gauge-cocks,—at least, until the construction of boilers shall make their explosions, when they do occur, altogether less destructive than they are at present. Indeed, if the vigilance and skill of those who are entrusted with the engine might be implicitly relied on, there would be little occasion for seeking any other safeguard: but *men* are scarcely less fallible than *mechanism*; and if the defects of this make it an uncertain dependence, the defects of the other ought, on the same principle, to teach us the necessity of providing a check against those causes of danger which do continually act,—such, for example, as deficient skill, or inattention, or drowsiness, or the use of spirituous liquors, or unforeseen accidental circumstances—causes that beset the passengers' way with dangers which a timely prevention generally disarms, but which sometimes give terrible demonstration that they are not imaginary. From such considerations we infer that no apparatus can do away with the necessity of that personal vigilance which is now the only dependence for safety—that the single end of an apparatus should be to provide a check upon those causes which make that first dependence sometimes to fail, and that such an apparatus is really most necessary, notwithstanding the opinions of many practical men to the contrary.

But, in forming such an apparatus, it should be a principle to make its indications of such a kind as to give the early notice of impending danger, not to passengers, but to those attendants on the engine whose business it shall be to apply the remedy. An opposite idea, it is true, has been incorporated into most of the current devices, for sounding or ringing alarms, or regulating moveable indices, open to the sense of all who may wish to gauge, at any moment, the precise dimensions of their travelling security. Not that bells or an index might not be so arranged as to give timely notice in the proper quarter only; but those projectors who have contemplated arrangements for indiscriminate alarm, have taken measures to defeat the success of their own projects, since experience has shown that the excitement and headlong impulses of a mass of people, acted on by the impression of impending danger, are almost as much to be dreaded as any common danger itself; and it is from their experience of this tendency, as well as from motives of immediate interest, and pride of personal feeling, that captains and proprietors would naturally discountenance every plan which would proclaim indiscriminately each momentary danger. The thing to be aimed at is to give notice when danger is at hand to those who have the means of averting it, and not at once to others; for, although it were ever thought a doubtful question whether passengers ought not at once to know the crisis, yet it is not a doubtful question whether captains and proprietors will readily consent that they shall; and still less is it doubtful respecting any specific means of safety, whether it will come into general use without the favor of those authorities.

These considerations, with others, led the writer many months ago to suggest to two or three individuals, of great skill in the steam engine, an arrangement for causing a small puff of steam to issue and alarm the engineer and firemen, in case the water should fall too low, while by others it would be undistinguished from the common sounds that now issue from the boilers, unless, indeed, the evil were permitted to continue uncorrected, in which case the

increasing alarm would give indiscriminate notice of neglect and hazard. Since the time when those communications were made, an interesting article has found insertion in your Journal respecting a safety apparatus invented by Mr. Kennedy, of New-York, which, if I understand it rightly, embraces in its plan substantially the same idea. Mr. Kennedy, therefore, if that method of alarm shall be found to possess advantages sufficient to bring it into use, will be entitled to the merit of having first brought the idea up to public notice; though his particular arrangement, there is reason to fear, would fail of success, from a circumstance which deserves to be pointed out more specifically.

The circumstance alluded to, (and which, indeed, is common to most other plans that have been proposed for this object,) is that the rod, which connects Mr. Kennedy's float with his escape valves, is made to pass through the boiler in such a manner that this rod, or rather the "wadded stopper" which it works, is subject to the atmospheric pressure above, and the steam pressure beneath; but as the atmospheric pressure is subject to changes equivalent to two inches of mercury, and the steam pressure in the boiler to changes much greater, it may be seen at once that a stopper of no more than one inch in area would be subject to influences which would of themselves greatly impair the accuracy of the indications of any float of moderate size. Add to this the friction of the stopper, which by reason of its packing must adhere to the tube with a considerable force, and there will be found in these three disturbing forces reason to apprehend a very capricious action of the float.

In my own arrangement, as well as the preceding, there are valves and a rod; but the rod is to work wholly in the steam, and is to be connected with the float by the intervention of a lever, which gives a considerable mechanical advantage,—say, an advantage of three to one. At the same time, packing is made unnecessary by the adoption of a metallic plate, working upon another plate in the manner of the common slide valve; but this will be more fully understood when we shall come to the figure and explanation.

None of the plans in your Journal which I have noticed, except Mr. Kennedy's, have guarded against the uncertain amount of action in the float from its ebullition or foaming of the water. Mr. Kennedy has proposed a box, in which his float is to rise and sink; but I propose to accomplish the same object only by adapting the form of my float to that purpose, in the manner following: Suppose a float of the form and in the position of an upright cylinder, sunk just to touch the boiler at its lower end, or within an inappreciable distance of it, the water in which it floats being dead or free from ebullition; then when steam began to be generated, the water would swell in bulk and rise in height around the cylinder, but the upward pressure upon the cylinder's base would remain unvaried, since the specific gravity of the column above it is as much diminished as its height is augmented. The cylinder, therefore, would neither sink nor rise, but would retain its position unaltered until the absolute quantity of water in the boiler became itself altered. By adopting thus a cylindrical float, to sink in the dead water as near to the bottom as the requisite play of the float will admit, we may secure the necessary regularity of action. But, in case it should be inconvenient for the float to sink so deep, let us suppose the immersion to be only to a part of the water's depth—it may be one-third, or one-fourth—then, if the immersed cylinder suddenly break off in its shape to a less diameter at the water line, forming a smaller cylinder, resting immediately upon the larger, and united to it at the precise line of the water, and if the cross section of the smaller bear the same ratio, in area, to the cross section of the larger, that the immersion in dead water of the combined float bears to the average depth of dead water required in the boiler, such a float will be very nearly stationary

tionary when the water changes from its dead state to a state of violent ebullition, or foaming. By the principles of hydrostatics, it would be perfectly stationary if the density of the floating column of water in ebullition were alike from bottom to top; but this is not the case in reality, by reason of the bubbles of steam enlarging a little as they ascend, and the greater quantity of steam thrown up along the sides of the boiler, establishing a superficial current from the sides to the middle. The variation from equal density, however, in the middle, is not great, and it is in favor of the float's descending too low when the water foams: which is on the side of safety. One of the gentlemen to whom I had communicated, in conversation, the principles of this apparatus, objected to hollow floats; that he had often in the actual trial found them unaccountably to fill with water. This result was doubtless occasioned by minute imperfections in the metal and workmanship, which did not manifest themselves until the float became subject to the steam pressure in the boilers, and to the corrosive action of the water and gases. These imperfections it may not be easy wholly to avoid; and the objection led me to adopt, in my proposed arrangement, a float entirely open at the bottom, which would always be emptied of water by the ascending steam, and its buoyancy kept unimpaired so long as there is occasion for its action.

Before leaving this subject, I will remark upon one mechanical principle, which, if real, possesses the greatest practical importance. The nature of the danger which is to be dreaded, in the case of a deficient supply of water in the boiler, is very generally understood—that is, if the water line descends below the flues, they become intensely heated, and when the water, either by ebullition or by injection through the supply cock, again reaches the incandescent metal, an immense quantity of vapor is immediately generated, which neither the safety valve can discharge, nor the boiler sustain. This is a common and satisfactory statement, and one which receives confirmation from the valuable experiments of Professor Johnson, of the Franklin Institute. There is, however, a mode of action in this vapor, and one which may be, in particular cases, of intense efficacy, that involves a mechanical effect additional to those above mentioned; and I embrace this opportunity of calling the attention of men of practical science in the steam engine, to the principle involved, as I do not remember ever to have met with it. It is well known that, if a charged gun barrel be so loaded as to leave a considerable space between the ball and charge, the piece will burst when fired. The French, and I believe the military rationale of the fact is, that the flame, reverberating from the ball back to the charge, creates a more perfect and sudden inflammation in the chamber than would otherwise take place. But, although this explanation does assign a real cause, we might ask whether the amount of gas thus sud-

denly evolved, can exceed that which was pent up in the same chamber, at the proof of the piece with double or even treble charges, and weight of ball? A more adequate cause might be assigned, arising out of the established principles of re-action: for when inflammation of the charge takes place, the whole volume of gas, urged by a pressure equivalent to hundreds of atmospheres, rushes towards the muzzle of the piece; but when it meets the ball, there is a sudden check in the moving mass, which must re-act laterally upon the chamber in the manner of a shock or blow. The accumulated force which the gaseous material has been progressively receiving from its evolution to its impact on the ball, is brought to bear in one instantaneous impulse on the sides of the piece which cannot resist the momentum, and swells or bursts. A most able mechanic, the same who is engaged in conducting the gun factory of the late Eli Whitney, of New-Haven, informed me, not long ago, that, at one period of their inspections by the United States' officer, more than a hundred barrels were ruined by being swelled or burst at the chamber, from some cause most inexplicable to the artificers, till at length they made a ponderous rammer, to drive home the balls with most unerring certainty, and the mysterious effect was experienced no longer. Now, to apply this principle of force to the subject in hand, when, in the case supposed, the water, by ebullition or by injection through the supply cocks, reaches the incandescent metal, not only an immense volume of vapor is suddenly generated, but, being generated within narrow limits, it must rush on every side with great velocity, and reach the limits of its confinement with accumulated momentum, and a shock similar in kind (though vastly less in amount) to that experienced in the case of the gun barrel already dwelt upon. This principle of force is a real cause of rupture, of an unknown degree of efficacy, and one which ought not to be neglected by practical men; for it may sometimes occur, in consequence of the same mode of action, that even without a deficiency of water, but merely from excess of steam, our present means of safety may become a cause of explosion; for if an overstrained boiler were suddenly relieved from its state of undue tension by a hasty opening of the escape valves in full, the water, being of high temperature, would fly into steam, which, though not in volume too excessive for the boiler to bear, would certainly rush with an upward motion to the limits of the boiler, and encounter the resistance there with a shock which might prove fatal. In every such case the escape valves should be opened very gradually. This may possibly prove to be the explanation of the circumstances which have been accounted so mysterious, that boilers placed apart, and connected only by the steam education pipes, manifest a sympathy through which, in case of rupture, a second boiler often follows the destiny of the first: for instance, in the late disaster of the New-England,

which was caused, it is believed, by excess of steam, and not by deficiency of water, it cannot be supposed that the two boilers were so nicely matched in strength that a given pressure in the same instant shattered both; but it may be supposed that, when the first exploded, and pressure was thus taken off the second through the eduction pipes, water flashed into steam in quantities equal to the discharge through the vent opened through the pipes, and met the boiler, already strained to its limit, with a momentum which proved fatal. This idea is countenanced by the first and second boilers in that unhappy disaster.

I now proceed to explain the prefixed figure, which is intended to represent a middle and vertical section made longitudinally through the boiler, and safety apparatus proposed and alluded to in the foregoing remarks. A B represent the lowest admissible water line; and the dotted line, above, the highest. At A is a cylindrical float, extending nearly to the bottom of the water; or, for the uniform cylinder, may be substituted the two cylinders combined in one float, as shown by the dotted figure at A. If this form be adopted, the lower cylinder must lie wholly immersed, when the water is free from ebullition, and the smaller must be as much less in cross area as the depth of immersion is less than the depth of water, in order to counteract the effects of ebullition. The float which is adopted must be open at bottom, to admit steam; and tight at the top and sides. It is to be attached to a lever, A B, working vertically around a fixed axis at B, and carrying the slide D by means of the rod shown in the figure, which must be so attached to the lever as to allow a slight horizontal play at the point shown at the bottom of the rod. The water line being shown in its lowest admissible position, it will be seen that, if it descend lower, the orifice in the sliding piece at D will come into junction with the lower orifice C, and emit a puff of steam into the fire room; and the lower the water descends, the greater will the quantity of steam which is emitted become. But if so much water be injected as to raise the water line above the dotted line parallel to A B, the orifice D will come into junction with the upper orifice C, and steam will be emitted thence.

The subordinate fixtures and arrangements there is no necessity for explaining. I would only add, that every thing in this arrangement, of which I am the author, is at the service of every one who can use any part of it to advantage. I am, Sir, yours, respectfully,

ALEXANDER C. TWINING.

We annex the following plan, suggested by Mr. John S. Williams, of Cincinnati, Ohio:

The principle may be thus applied:—Place the water chamber (C) either against the boiler, or at a distance on a level with it. This chamber must have one valve (E) opened toward it from the supply water, and another (F) from it towards the boiler, on the principle of the seat of the common force pump. By an escape-ment, or three-way cock (D), placed in a small pipe (b) leading from a, the steam in the boiler to the chamber the atmospheric and steam pressure may be alternated in the chamber, so as to allow the supply water first to flow into the chamber through E, and then from it

through F to the boiler. No force is required, except to work the very small escapement in the alternation pipe; and never while the supply water in A, and operation is kept up, will the water in the boiler rise higher or sink lower than the line a, above the level of which the chamber shall have capacity equal to the waste during the operation. d is a float to prevent condensation.

Or the same result may be produced, by placing the chamber C something higher than above described. Let the water in the supply pipe, reservoir, or cold water pump, A, be kept higher than the chamber C, which is furnished with valves, E and F, as before. Let the entrance of the alternation pipe b, be exactly at the water line a in the boiler B. By means of the lever c, work the double puppet valve D up and down; or provide any means so as alternately to shut the steam and air out of the chamber C. This is all the power required. It is evident that if the water in the boiler should be lower than a, the chamber would pour in more than the water, and raise the water to a; but if the water should happen to be higher than a, no steam could pass through b to displace the water in C; and of course there would be no supply until the water would be evaporated down to a, where it would stand for ever, provided the supply water in A, and the opening and shutting of D, were continued. When the steam is down, the boiler might be filled through E and F.

If the chamber C were placed in the common condenser, and subject to the action of the escape steam, the necessary supply of water, and no more, would be heated.

One apparatus will supply any number of connected boilers; but should one be attached to each boiler, and the boilers unconnected, a boat might be ever so much, or ever so long listed, without a possibility of the water being more exhausted in one than in another; and no more sediment would be collected in one boiler than in another. If, in addition to this, were each boiler furnished with a valve in the steam pipe, opening toward the cylinder, the following benefits would be the result of the arrangement. A weak boiler or flue would not be subjected to the strain of an accidental surcharge of steam in another. Should a surcharge happen in one boiler, it would occupy the whole safety valve for its relief. Should one boiler burst, or a flue in one collapse, the others would not be affected by it, and not a stroke of the engine would be lost, but the remaining boilers would continue to work the engine as if nothing had happened, unless the bed were deranged. Were one boiler to burst, that, and that only, would exert its power to destroy the boat and crew, and to derange the bed: whereas by the present system, the force of all is exerted by an accident in one. The above results might be obtained from one supplying apparatus, having a branch pipe with a valve F and stop cock, running into each boiler, for its separate supply.

On increasing the Facilities for Transportation by Water. By JOHN N. POMEROY. To the Editor of the American Railroad Journal.

Sir,—Although my acquaintance with you is very limited, I hope you will pardon the liberty I take in addressing you. My profession necessarily occupies a great portion of my time and attention; nevertheless, I am not indifferent to the progress of improvements which are going on at such an astonishing rate in our country. The wonderful facilities for rapid transportation afforded by the introduction of railroads, and its vast superiority, in velocity at least, to the modes of transportation on the natural water communications throughout the country, could not but excite the inquiry—"Is it true, then, that the various rivers and arms of the sea, which intersect the face of the earth,

and which have been heretofore considered as great highways for the convenience of man, and designed as such—is it true that the progress of improvement is to prove these but *obstacles*, rather than *facilities*?" The present superiority of the railroad system would seem to indicate an affirmative answer to this question; but a reflecting mind would be unwilling to admit it, and would be led to inquire into the *reason* of the apparent superiority, and would, at all events, be induced to doubt the wisdom of man, rather than his Maker. What, then, is the reason why we cannot pass with equal (or with greater) facility and velocity through the water, as on the railroad? It is doubtless, chiefly, if not wholly, on account of the *law of resistance* to motion in fluids: can that be obviated? I do not hesitate to say it can, and will be. How? This leads me to the object of this letter, which is to describe a plan which I have invented for that purpose, and as your opinion, and, through you, the opinion of practical men, of whom, I think, you must number many among your friends or acquaintances. It appears to me to obviate the difficulty above referred to; but is the plan *practicable*; or are there insuperable practicable objections to it? In order to give you an idea of the plan above mentioned, or machine, I may as well describe the one which I have made; first premising that the object is to have the *sustaining* part of the vessel the part which moves and *gives motion*. The machine which I have made is composed, first, of 25 tin cylinders, 8 inches long, 2 inches in

diameter, with caps at each end, water-tight, and a pivot also in each end, in the centre of the cap or head, say a half inch in length. These cylinders are connected together by a chain, composed of narrow strips of tin, having

holes at each end, and placed on the pivots, so that the cylinders nearly touch each other, not

quite; and so that the cylinders can revolve on the pivots without interfering. These cylinders, thus connected at each end, are made to enclose the *hull*, or boat, which is (as I have

made it for experiment) a frame about 18 inches long, 8½ inches wide, and 4 inches in height or thickness, and so turned at each end as to admit an easy path for the cylinders, and also so that the cylinders may strike the water in a proper direction. There is a flange on the exterior edge, or circumference of the frame, to prevent the cylinders from rolling off. It will now be perceived, I think, that a force exerted on the pivots in the same direction, on any one or more of the cylinders, that it will give motion to the whole, and when placed in the water, the machine, sustained by the buoyancy of the cylinders, must move as fast *ahead* as the cylinders pass through the water to the stern. This power in my machine is applied to the pivots of the cylinders by two wheels, on a shaft, which passes transversely through the machine, and plays on gudgeons at each end—

the wheels adapted by cogs to act on the pivots, and the shaft turned by a spring.

Now, what are the practical objections to the above? I admit the first impression must be unfavorable—it is, as a water-craft, entirely unique; but, appearances aside, it may be said that a vessel on this construction cannot be made sufficiently strong to sustain itself in rough water without being too heavy to derive the benefit proposed from the cylinders. It appears to me that the form of the hull is well adapted for strength, without much weight. As to the cylinders, it is more doubtful. I have supposed a vessel made of about 100 feet in length, and 30 feet broad, 10 feet high between the two floors, having 60 cylinders or barrels, each 30 feet long, 5 feet in diameter, and having 25 barrels, say, in the water, which would be about the number. Now, 25 of these barrels, entirely immersed, would sustain 450 tons; and it appears to me that a vessel complete of this construction and size might be made considerably within the limits; and it is to be borne in mind, that, from its mode of progression, it would not conflict with rough water, as ordinary vessels do, as the impinging cylinders would rather 'nullify' than make war with the opposing element. Would it not be top-heavy, and careen? I see no objection to its being made sufficiently broad to avoid this difficulty. Would it not be inconvenient? I should judge not, but the reverse, as the rooms might be made square, high, and with sufficient windows at the sides; and I see no objection to having guards, a deck fore and aft the cylinders, and a promenade deck over the cylinders. Would it require more power to produce a given velocity than ordinary steamboats? I think very far less; but the cylinders, which are in the water, would be much impeded in their revolutions (which must be rapid) by the water. If this be a difficulty, it may be avoided by wheels on the pivots, or gudgeons of the cylinders, which should sustain the cylinders and revolve on their axes, leaving the cylinders to pass the water without revolving.

I do not flatter myself that I have nullified all objections which may be raised to the practicability of the above plan. What I have said is by way of suggestion; and having had the subject on my mind for two or three years, I am anxious to relieve myself, by getting the opinion of experimental and scientific mechanics, as to its practicability and probable utility. The same principle, I am inclined to think, may be applied to railroad cars with many advantages.

Very respectfully, yours, &c.

JOHN N. POMEROY.

Report of WALTER GWYNN, Esq., Engineer, to the President and Directors of the Portsmouth and Roanoke Railroad Company.

[Continued from page 24.]

The difficulties to be overcome having been adverted to, and the plan of the work described, I have next to submit to you the probable cost of the railroad.

The gradation on division I, from Portsmouth to Suffolk, is finished, a portion of the road has been laid, and nearly all of the timbers delivered. It is contemplated to complete it in the course of the winter, or very early in the spring. On this section of the road, the Dismal Swamp is encountered and successfully crossed; large ditches were dug, which sufficiently drained and furnished materials for the substratum of the road-bed, and this covered with sand to the depth of a foot or more, formed at once a durable and unyielding foundation for the superstructure. Capt. Crozer's estimate of \$90,563, for this portion of the work, will prove more than adequate; the cost will not exceed \$75,000; which will be for

DIVISION I.—From Portsmouth to Suffolk—17 miles.
At \$4411 76 per mile, \$75,000

DIVISION II.—From Main Street, in Suffolk, to Station 290—10 miles.
Excavation—108,923 cubic yards, at 9 cents per yard, \$10,347 68
Embankment—123,213 " at 10 cents, 12,321 30
Four Stone Drains, 1,000
Abutment at Smith's Branch, including Bridge, 4,200
Six Truss Bridges, 600

One hundred and sixty tons iron, at \$45 per ton, 7,200
Six Tons of Spikes, at \$198 per ton, 1,188
Splicing Plates, at \$15 per mile, 150
105,600 lineal ft. heart pine Rails, \$50 p. 1,000 ft., 5,280
10,560 Sills, at 50 cents per Sill, 5,280
21,120 Oak Wedges, at 31 cents per wedge, 739 20
Carpenter's work, Horse-path, &c., \$704 per mile, 7,040 J

Total, \$55,846 18

DIVISION III.—From Station 290 to Station 525, on the West bank of the Blackwater—9 miles.

Excavation—90,849 cubic yards, 9 cents p. yd. \$8,176 41
Embankment—92,358 " 10 " 8,647 59
20 Truss Bridges, 1,500
Stone abutments, Pier & Bridge across Blackwater, 9,500
144 Tons of Iron, at \$45 per ton, 6,480
Spikes, at \$118 80 per M., 1,069 20
Splicing Plates, at \$15 per mile, 135
95,040 lineal ft. heart pine Rails, \$47 per 1,000 ft., 4,466 88
9,504 Sills, at 40 cents, 3,801 60
19,008 Wedges, at 31 cents, 665 28
Carpenter's work, Horse-path, &c., \$704 p. mile, 6,336

Total, \$50,777 96

DIVISION IV.—From the Blackwater to Station 672, on the West bank of the Nottoway—5 miles, 2275 feet.

Excavation—12,375 cubic yards, 9 cents p. yard, \$1,113 75
Embankment—60,735 " 10 " 6,377 17
Stone abutments, Pier & Bridge over Nottoway, 11,100
87 Tons Iron, \$45 per ton, 3,915

Add for contingencies, superintendence, land damages, the extension of the Road to the wharves in Portsmouth, warehouses, shops, water-stations, passing places, &c. \$69,666 22

Total amount, \$475,000 00

The foregoing aggregate amount, it is believed, embraces every item of expenditure that is likely to occur. The increased demand for labor, which may be occasioned by the commencement of the James River and Kanawha Improvement, and other works contemplated in Virginia and North Carolina, is the only contingency that can affect the cost of this road. This I have endeavored to provide for, by estimating the amount of work as exhibited on the profile; notwithstanding I am confident that the line is susceptible of modifications, by which the amount of excavation and embankment may be materially lessened, and the grade and direction at the same time considerably improved.

I am unable, at this time, to form any correct estimate of the revenue likely to be derived as a return for the capital expended. It may, however, be expected, that I should offer a few general remarks on a subject of so much importance. The direct communication which this railway, in connection with the Chesapeake Bay, and the French Town and Newcastle railroad, offers between the northern and southern cities, the speed, comfort, and perfect safety, with which passengers can be conveyed through this route, must certainly secure to this company a considerable revenue. The favorable point selected for the termination of this road on the Roanoke—the probable prolongation of a railroad from Weldon, southwardly, by the enterprising citizens of North Carolina—the certainty that to Weldon, as a place of deposit, the heavy and profitable products of that country, and of the valley of the Roanoke, must go—thence, most probably finding their way on your railroad to Norfolk, justify the most sanguine calculations of considerable and lasting revenue to your Company.

The importance of this communication to the whole district of country through which it passes, and especially to Norfolk and Portsmouth, is too well known and appreciated to be dwelt on here.

I have the honor to be, gentlemen, very respectfully, your obedient servant,

WALTER GWYNN, Engineer.

The stock of the Liverpool and Manchester Railroad Company sold in London on the 19th of November at £190 per share, £100 original cost.

The Stanhope and Tyne Railroad Company are proceeding rapidly in the formation of their line of way from Stanhope to South Shields. They have engaged to perfect their splendid undertaking by forming branches from below Bolden to Monkwearmouth and Heworth; the latter will join the intended continuation of the Carlisle Railway, affording a communication between Carlisle, Stanhope, the Hartlepool Railway, Monkwearmouth, Gateshead, and South Shields.—[Tyne Mercury.]

[From the *Mechanics' Magazine*.]

State of Manufactures in America—Evidence of Mr. James Kempson, of Philadelphia, Cotton Manufacturer. [From the Factory Commissioners' Report in Great Britain.]

Most of our readers, doubtless, have heard of the struggle that has been going on between capitalists in England and the friends of amelioration of the condition of the working classes in that country, particularly of those who have not arrived at maturity, and are in fact in a much worse condition than most slaves in any part of the world. The philanthropists succeeded so far as to obtain a parliamentary commission of inquiry, which was followed up by the introduction of a bill into the House of Commons, regulating the hours of work in factories for all boys and girls under fourteen years of age, we believe. That bill passed the House of Commons, but the *House of Incurables*, (the Lords,) as they have been so well termed, thought fit to reject it.

In the course of the investigation, Mr. Kempson, of Philadelphia, was examined, and his testimony we now insert, and we are sure it will be perused with feelings of pride by all our readers.

With what extent of manufactures have you been conversant in America?—I have been acquainted with the manner of conducting manufactures in most of the manufacturing states.

What number of workmen do you employ in your manufactory?—About four hundred.

What is the lowest age of persons in your employment? None under nine.

Have you many about nine years of age?—We have a great many between nine and twelve. About one-fifteenth of the persons employed in the United States are under twelve years of age.

What is the utmost extent of your daily working hours?—The actual number of working hours averages throughout the year twelve hours of actual work; at some seasons it is nearly fourteen, and at others it is little more than ten.

Is the labor for fourteen hours often continuous for many successive days?—We change the period by the light. We never light up in the mornings, nor in the evenings, from the 20th of March to the 20th of September; and from the 20th of September to the 20th of March following, we work until eight o'clock of the evening.

Do the children work during the whole hours of work?—Yes; we never make any difference on account of age.

Have any complaints been made in the United States as to the propriety of such extent of labor for children?—There have been newspaper complaints, originating probably from the workmen who came from this country to the United States; but among our workmen there is no desire to have the hours of labor shortened, since they see that it will necessarily be accompanied by a reduction of their wages.

What proportion of the persons employed are natives of the United States?—Throughout New-England, which are considered the manufacturing states, above eight-tenths of

the persons employed are natives of the United States.

Are many of the remaining two-tenths English workmen?—The greater portion of them; but, as a general rule, they do not like to take English workmen in the New-England factories.

Why do they not like the English workmen?—Because they are so dissipated and so discontented.

Is this their general character in the United States?—Yes; after they have been some time in the country, they are noted as the greatest drunkards we have. The whole-sale price of whiskey is, with us, nine pence per gallon, and they appear not to be able to overcome the temptation. Our own workmen are *better educated, and more intelligent, and more moral, and refrain more from sensual indulgence.*

How does the discontent of the English workmen, of which you have spoken, usually manifest itself?—In the workmen becoming masters, in strikes, and demands for wages, almost always ill-considered, with which the master cannot comply, and which grievously interfere with his commercial operations; their ignorant expectations generate ill will and hostility towards the masters.

Are no jealousies entertained by the American workmen towards their masters?—In America we never hear the word master; they usually speak of the manufacturer by name, or as their employer, and view him rather as a tradesman to whom they dispose of their labor, than as a person having a hostile interest. There are no jealousies between American masters and workmen, of the nature of those which appear to prevail between the English workmen and their employers.

Are there no combinations to keep up wages in America?—None amongst the American cotton manufacturers.

Are there no combination laws?—None.

To what do you attribute this state of things among the American workmen?—To their superior education, to their moral instruction, and to their temperate habits.

Have you any national system of education?—We have public schools, supported partly by state funds, and partly by bequests. All children have the privilege of attending.

Do they, in point of fact, very generally attend in the manufacturing states?—They universally attend; and I think that information is more universally diffused through the villages and the whole community of the New-England states, than amongst any other community of which I have any knowledge.

What is the general view taken of these schools by the manufacturers and persons of wealth in America?—From their experience they deem them of the greatest importance to the welfare of the state. They are encouraged by the state governments and all the leading persons of the state.

How do the children whom they employ obtain education?—The manufacturers are always anxious that the children should absent themselves from the manufactory during two or three months of the year to attend the schools. The manufacturer very frequently suggests to the parents the necessity of the children being taken to school. The sending the child to school is generally an inconvenience to the manufacturer.

Is the inconvenience of the children going to school such as to increase the cost of pro-

duction?—I do not think it does increase the cost of production. The only inconvenience is in the trouble of getting other hands. We think the advantage of their being educated more than counterbalances that trouble.

What is the nature of this national education?—It consists in reading, writing, arithmetic, grammar, and geography.

Do the workmen read much?—Yes; we have frequently a difficulty in keeping books out of the hands of some of them when they should be engaged in their work.

What sort of books do they usually read?—Voyages and travels are the most favorite reading with them. They are also great readers of newspapers, and some of the workmen take two or three.

Then what is the cost of each newspaper?—Less than 2d.

What wages do you usually give?—We employ them by the year. A person ten years old would get 3s. a week; a person twelve years old, 4s. a week; fourteen years, 5s.; sixteen, 6s.; eighteen, 8s. Those more advanced in years would earn 10s. The smaller children in the carding room are those who earn 3s. a week; those attending the drawing frames earn from 5s. to 6s.; those who attend the roving frames earn 8s. a week; girls attending the throstle-frames earn from 5s. to 8s.; machine makers earn about 5s. a day; mule spinners earn about 5s. a day; overlookers earn from 5s. to 6s. a day; assistant overlookers from 3s. to 4s. a day.

What do the men pay for board when they board with families?—From 6s. to 7s. per week.

What do young women pay?—Five shillings per week.

And children?—They generally board with their parents.

What is the description of fare usually obtained by the American workmen?—Nearly the same articles as those used by the more wealthy classes. They have as much meat as they wish twice a day; they have fruit pies at every meal; in short, as I have stated before a committee of the House of Commons, I have paid eight shillings a week for board, lodging, and washing, and live as well as I could live in equal lodgings in a village in England for two pounds a week.

What is the difference in the effects between fourteen and ten hours' work on the health of the persons employed, so far as you have observed in America?—When they worked twelve hours, the thermometer stood at 103°, and they were then more unhealthy than when they were working twelve hours in the winter season; but I believe that those who were in the mill enjoyed better health, both during summer and winter, than those who worked at agricultural employments, or than those who were idle. I state this from my own observation. I resided at the house of a medical practitioner, who had the practice of most of the persons who were employed at the mill, as well as of most of those who were employed in agriculture, and my own observation was corroborated by his reports, as to the sickness prevalent. Thus I received my impression of the superior healthiness of those engaged in the factory.

Are the American children stronger or weaker than the children of the English operatives?—The youngest American children are, I think, rather the strongest. Since No.

vember last I have been engaged in visiting the manufactories here, and I should say, that, on the whole, the children are rather stronger in America than they are here.

Would you call the English manufacturing children, as a body, unhealthy?—No; I should almost think they are as healthy as the children in the agricultural districts. I have noticed that the children of a factory in a village usually look better than the children of a factory in a town. I should think this might be accounted for from the difference of the residences in the villages as compared with the residences in the towns, where they appear to work longer hours.

Does your experience in America of the short as compared with the long hours, enable you to form any judgment as to the probable effects upon the health or comforts of the workmen of a reduction of the working hours to ten in this country?—The climate is so different that I can form no judgment. The longest hours of our work are during periods of the most oppressive heat.

Do the children attend school at any particular period?—No; they attend during one period as much as another.

Do they select the times of the long or of the short hours?—I do not think they make any selection as to the hours of work. If they selected the time of the long hours they would have the night-work of the winter. They would, I think, as soon have the longer hours of the summer to avoid night-work.

What is the nature of your manufacture?—Spinning and weaving coarse yarn.

Is any of it for exportation?—Yes.

To what markets?—South America, West and East Indian markets.

Do you find that you can compete successfully with British manufactures of a similar kind in the same markets?—Yes; although we labor under some disadvantages that you do not.

What disadvantages?—One of our disadvantages is, that in the East India markets we have to pay a duty which you do not pay; and we have to pay six per cent. interest on the advance, which is considerably higher than you have to pay. A further disadvantage we labor under is, that whereas a large proportion of your manufacturers export their goods direct, and are therefore not subject to any commission on the shipment, our manufacturers never export on their own account, and the shipping merchant starts with a commission of five per cent. on the price which the manufacturer receives.

Have the goodness to explain the nature of the charge of five per cent. commission to which the article is subject prior to shipment?—The manufacturer sends his goods to a commission merchant at the shipping ports, who receives five per cent. for selling and guaranteeing.

And notwithstanding these drawbacks you can maintain the competition with us?—Yes; and not so only, but are gaining ground upon you, and have already excluded you from some markets.

From what markets?—Some of the Mexican and South American. Several of our largest establishments have large contracts pending for a long time forward for those markets, at prices which would not give a fair return to the British manufacturer, but are very profitable to our manufacturers.

You say this from having ascertained, du-

ring your visit to Manchester and other manufacturing districts in this country, the exact state of the relative prices?—Yes.

What are the present relative prices of yarn,—for instance, of No. 16?—No. 16, water twist, made entirely of good cotton, sells in the United States at 10½d. per lb.; in England, No. 16, yarn, made from a mixture of waste twists, and a small quantity of boweds, sells at 11d. per lb. The price of 10½d. in America is from the commission merchant, who receives 5 per cent. for sel-

	United States.	England.
Interest on dressing machine,	£2 11	£1 12
Do. twelve power looms,	8 6	4 10
Cost per annum of one horse power,	3 10	12 10, at 5 per cent.
Cost of dressing 3,756 pieces,	23 9	46 18
Cost of weaving,	125 4	156 10

American, 10½d. per piece, £163 0—England, 11d. £222 0

How do you account for the difference between £3 10s., which you state as the cost per annum of one horse power, and £12 10s. as the cost in England?—In America it is water power, which exists there in great abundance, at a very low rent, even in the best situations; whereas in this country it is mostly steam power, or, if water power, at a very high rent.

What do you reckon will be the effect on the cost of production of your manufacture, if the working hours of your mills were, by an act of your legislature, to be reduced from an average of 12 to 10 hours?—They would be increased in price about ten per cent.

Have you the means of showing how the reduced hours of work would operate on the cost of production?—Yes, by the following statement:

Estimated value of the cotton manufacture of the United States—Wages, £2,087,400; cotton, £1,800,000; profit and interest, £1,529,266; annual value, £5,416,666. Now, supposing a legislative enactment to limit the working hours to ten, and in consequence of foreign competition the value of the goods must not be increased, and in order to make the same quantity he must employ one sixth more hands, and the interest on this increased investment must be deducted from the wages, for no other item can be reduced; taking the interest, wear and tear, at 8 per cent. upon this further investment, the amount will be £112,819.

£2,087,400 wages, as before
112,819

£1,974,581 wages after.

The number employed previous to this supposed alteration was 62,157, receiving upon an average annually £33 10s. The number increased to 72,572 would receive £27 4s. Supposing the workmen not reduced in their wages, the amount would stand: Wages, £2,429,998; interest on the investment, £112,819; cotton, £1,800,000; interest and profit, £1,529,266; total, £5,872,073.

What, in your opinion, would be the effect of a compulsory limitation of the working hours in this country to ten instead of twelve, upon the manufactures of the United States?—It would tend much to their increase. I think we should not only be able to undersell you in markets abroad, but even in your home market.

Do you mean after paying the present import duty into this country of ten per cent?—Yes.

ling it on eight months' credit; and the price of 11d. in England is on three months' credit from a manufacturer.

Do you consider the price of 10½d. to be remunerative to the American manufacturer?—Decidedly so.

And do you consider that you have equal advantages in weaving?—Yes.

Have you the means of showing what is the comparative cost of weaving in the United States and in this country?—Yes, I can show it by the following statement:

Do you not think that we should be under the necessity, in such a case, of adopting your tariff system?—Most undoubtedly, if you wished to preserve even your home market.

ADVICE ON THE CARE AND MANAGEMENT OF TOOLS.—From a new edition of the Cabinet Maker's Guide, we quote the following:

"The goodness of saws, chisels, and other edge tools, depends upon the quality of the steel, which should be uniform throughout, and it is always better to have them tempered too hard than too soft, for use will reduce the temper. If at any time you wish to restore the temper, and to perform the operation yourself, the best method is to melt a sufficient quantity of lead to immerse the cutting part of the tool. Having previously brightened its surface, then plunge it into the melted lead for a few minutes, till it gets sufficiently hot to melt a candle, with which rub its surface; then plunge it in again and keep it there until the steel assumes a straw color, (but be careful not to let it turn blue,) when that is the case take it out, rub it again with the tallow, and let it cool; if it should be too soft, wipe the grease off and repeat the process without the tallow, and when sufficiently hot, plunge it into cold spring water or water and vinegar mixed.

"By a proper attention to these directions, and a little practice, every workman will have it in his power to give a proper temper to the tools he may use.

"If a saw is too hard, it may be tempered by the same means; if you are near a plumber's shop, you may repeat the process conveniently and without expense, when they are melting a pot of lead.

"In other cutting tools you must wait till the steel just begins to turn blue, which is a temper that will give it more elasticity, and at the same time sufficient hardness."

CENTRE OF GRAVITY OF A SHIP.—A discovery, which is likely to be attended with important results to the navy, has recently been made by Commander John Pearce, R. N., of Plymouth. This officer, from various circumstances, was led to doubt that the centre of gravity of a ship was the axis of rotation, as hitherto imagined, and that this was the cause of so many errors occurring in masting. He accordingly proceeded to ascertain the truth of his doubts, by experiments on different models, which he has continued for upwards of twelve months, and the result, we understand, cannot fail to render the science of ship-building more comprehensive and demonstrative, as well as lead to the cor-

rection of other errors in the theory equally worthy of consideration! The axis of rotation has been fixed, by Capt. Pearce's experiment, at some distance above the gravity of the ship, and in the point which is known by the name of the lacentre; and we understand he considers the complexity of the theory, and not having considered the subject in a sufficiently practical shape, to have led authors into the error of confounding the centre of gravity of the ship with the axis of rotation; and that this has led to the error of supposing the lateral effort of the water, or resistance to leeway, to produce effects contrary to truth, and from which proceeds the present imperfect system of masting. In fact, the discovery of the true axis of rotation will be a complete key to the improvement of naval architecture, as *all the forces*, which are so constantly and variously acting, are estimated by the distances from the axis of rotation to the points where they are applied.—[London paper.]

AGRICULTURAL.

Selected from the N. Y. Farmer and Gardener's Magazine.

Economy of Cutting Hay for Horses—Improved Straw and Hay Cutting Machine. By The Editor.

It is stated in the publications of Great Britain, that the economy of using cut hay and straw has been fully and generally tested, particularly by stage proprietors, who, in consequence of the powerful competition from steamboats, were driven to contrive ways and means to lessen the expenses of keeping their horses, without diminishing their efficiency. They accomplished their objects in the substitution of cut hay for long hay. Similar circumstances have compelled the owners of stage horses in this country to adopt the same course.

Mr. Reeside, one of the largest mail contractors in the United States, has, we are informed, adopted the plan with very great saving in expense, and with much additional performance by his horses. It was the admirable condition of his stage horses that led the superintendent of the streets of this city, J. M. Bloodgood, Esq. to make inquiries, and to adopt a similar course of keeping the horses belonging to the corporation of New-York. On application to Mr. B. we were politely furnished with the following particulars:

The number of horses employed in carting street manure is generally twenty, and sometimes one or two more, or less.

In six months of 1831, when the hay was not cut, the following quantities were bought for their consumption:

January, 4,480 pounds; February, 10,304; March, 2,240; April, 15,680; May, 6,200; June, 5,000. Total, 43,904 pounds.

In six months of 1833—January, 4,000 pounds; February, 5,000; March, 5,300; April, 2,000; May, 7,000; June, 5,000. Total, 28,300 pounds.

One bushel of cut hay is given three times a day, with 4 quarts of ship stuff, and 2 quarts of Indian meal, at each feeding. Oats are sometimes given once a day instead of the hay and meal. Under this feeding, which may be considered pretty high, the horses, though they labor hard, are kept in much better condition than when long hay and oats were given. The

present plan of feeding is considered to be a saving in expense at least one third.

One reason why the horses, on this system of feeding, are much more invigorated and in finer order, is that they are not obliged to labor all night in eating dry hay, but have time to obtain rest and sleep.

One thing is pretty evident—the time will soon come when cut straw and hay, packed in bags, &c. will be brought to this city from the “far west.”

The cutting machine used at the corporation stables is that made by Mr. Johnson, of this city. The following drawing, which we take from the Edinburgh Quarterly Journal of Agriculture, is described as an improvement on that made by Mr. Johnson.

Some years ago, the straw or hay cutter took a new form, under the hands of a person who seems to have taken out a patent for the improvement. In this, the cutters are made to revolve, by being fixed upon a skeleton cylinder on the fly wheel shaft, the hay being brought forward by a pair of feeding-rollers, as had been done on some former occasions; but in this case, the progressive motion of the hay was constant, which enabled the inventor to dispense with the machinery required for producing the intermitting progress of the hay. Immediately on passing through the feeding-rollers, the hay is protruded through a cutting-box, the face of which is worked off to an interior cylindrical surface. The cutters, which may be of any number from one to four or more, are placed diagonally upon the skeleton cylinder. The diagonal position is considered necessary for the cutters, as they thereby pass through the hay with an oblique cut, producing an effect resembling that of shears, and which prevents the shock that would attend the stroke of the cutters if the whole length of its edge were to come in contact with the hay at the same instant.

From experience, however, it is now found that the oblique position of the cutters is attended with considerable inconvenience to the workmen, arising from the difficulty of setting the cutters when they have been removed for sharpening, or for any other purpose. The difficulty attending this operation may be easily conceived, when we consider that the edge of the cutters, when in proper adjustment, must form part of the sections of a cylinder, or of an elliptic curve; and hence the difficulty of its adjustment, with sufficient accuracy to insure good performance; for, unless the edge of the cutter come into all but actual contact with the lower edge of the cutting-box, the lower stratum of hay will be left uncut.

The defective position of the cutters in the hay-cutting machine having been suggested to Mr. Slight, of the firm of Messrs. Slight and Lillie, engineers, and model and machine makers to the Highland Society of Scotland, he has rectified the defect, and has produced a machine possessing the property of having the edge or

the cutters parallel to the axis of the fly-wheel on which they are mounted; and in order to retain the advantages of an oblique passage through the body of hay, the cutting-box is elongated into a nozzle, which is twisted until the mouth of it assumes an angle of about 30°. The face of the nozzle is worked off as in former machines to an interior segment of a cylinder, concentric with the shaft of the fly-wheel. By this arrangement, which is just reversing the former position of the cutting parts, the entire efficiency of the machine is retained, while its construction is simplified, the price proportionally reduced, and the keeping it in order also rendered much simpler.

The annexed cut exhibits one of these improved machines, as manufactured by Messrs. Slight and Lillie, with the framing made entirely of cast iron. A is the feeding-trough, the rollers being only partially seen. B is the nozzle or cutting-box. C C, the cutter-bearers, with the cutters attached by their bolts. D is a lever and weight, which, through the medium of the bridge E, keeps a constant pressure on the feeding-rollers, to counteract any inequality of feeding. F is the fly-wheel for equalizing the motion; and G, the handle to which the power is applied. The small pinion on the fly-wheel shaft gives motion to the spur-wheel, which is mounted on the shaft of the lower feeding-roller, and carries also the lower feeding-pinion. This last pinion works into the pinion of the upper roller, and both being furnished with very long teeth, they thereby admit of a limited range of distance between the rollers, according to the quantity of feed.

With one of these machines, a man, assisted by a boy to feed in the hay or straw, can cut at the rate of eight stones per hour; and that quantity of cut hay is found to be sufficient for sixteen horses for twenty-four hours.

The machine, of which the above is a figure and description, combines, in an eminent degree, expedition and efficiency, with ease to the workman. We do not think it can be made of a simpler construction.

Cultivation of Peach Trees. By R. H. B.

[For the New-York Farmer.]

Peach trees may be preserved, by good management, twenty, and probably forty or fifty years. They are destroyed from north latitude forty to thirty-six degrees, by a worm which feeds on the inner bark of the tree, at its root. This worm is said to be the offspring of a fly of the wasp kind, which deposits its eggs in the bark of the root of the tree while it is young and tender. The remedy consists in searching for the openings in the bark at the root, and taking them out. If this operation is repeated three or four springs, the worm never after can make a lodgement there. The bark of the tree by this time becomes so hard, that the fly cannot make the puncture, in order to deposit the egg, or if deposited it perishes. After the worm is cut out in the spring, draw the earth up around the

body six or eight inches above the other ground.

Of all the fruit trees produced in this climate, none bears pruning so freely as the peach; indeed, it should be treated very much as the vine is. All those branches which have borne fruit should be cut out, if there is young wood to supply their places. Proof—take a limb which has borne two or three crops of fruit, and notice its produce; take another on the same tree, which has never borne at all, and the fruit on this last will be twice the size of the former, fairer, and less liable to rot. In pruning, the branches should be taken or cut out of the middle of the tree: thus giving more air and sun to the fruit on the outer limbs.

The peach tree produces best fruit when the ground is not stirred about it while the fruit is on. When it has no fruit, it should be cultivated as carefully as a cabbage, or any other plant.

The above comprises the most important points in the rearing of peach trees, and good fruit; if attended to, I have never known them to fail,—and my experience has not been very limited.

I repeat what may, perhaps, be doubted, that the peach tree, if the worm is kept out of the root, will live, at least, twenty years; and that this may certainly be done by attacking them the first year of its growth, and continuing to extract them for three or four years in succession, not forgetting to draw the earth up as directed. Straw, chips, or trash of any kind, serve the purpose just as well.

Very respectfully, yours, &c. R. H. B.
Washington City, Nov. 26, 1833.

CURD-BREAKER FOR SKIM MILK CHEESE.—We have heard of many curious experiments adopted by housewives, and some of them highly ludicrous, to facilitate the breaking of curd. This simple instrument is a happy substitute for every sort of expedient. With it any boy or girl can break the curd arising from the milk of eight or ten cows in fifteen minutes. It is not intended for the making of sweet milk cheese, the curd of which should be broken very gently. It was invented by Mr. Robert Barlas, Gilmour Place, Edinburgh, and has been in use on some farms for several years past.

a, fig. 1, is a hopper of wood, 17½ inches by 14 on the top, and 10 inches in depth. b is a cylinder of hard wood 6½ inches in length, and 3½ in diameter. It is studded with hard wood square pegs of a quarter of an inch in the side, cut square at the ends, and projecting three-eighths of an inch. There are eight teeth in the length, and fifteen in the circumference, of the cylinder, 120 teeth in all. It revolves on a round iron axle 12 inches in length, and is moved by the crank-handle d in fig. 2; c c are

two wedge-shaped pieces of hard wood, made to fill up in some degree the space between the side of the hopper and the cylinder. These pieces rest on a slip of wood nailed to the lower rim of the hopper, to keep them in their place. The face of these is studded with nine teeth of hard wood, similar to those on the cylinder, in a horizontal position, but so placed as to embrace those of the cylinder at opposite sides. The stand e, fig. 2, can be made of any length, to suit the breadth of the tub into which the curd is broken. The implement is used in this manner: place it over a tub, heap the hopper a with curd, and turn the winch d in either direction, and the curd will fall quite small broken into the tub. While one hand is moving the machine, the other can press the curd gently down into the hopper. As cleanliness is a matter of the greatest importance in cheese-making, the internal parts of this machine being loosely put together, can easily be taken to pieces to clean. The cylinder axle rests on two hard wood plumber-blocks, f, fig. 2, one on each side, which slip out of their groove. They are held in their working position by the thumb-catch g, sunk flush with the bottom of the stand e, one over each plumber-block. The wedge-shaped pieces c c, fig. 1, come out. To prevent the curd working out of the sides of the axle, the cylinder is set a little at both ends into the sides of the hopper. The dotted lines in fig. 2 will give an idea how the internal part of the machine is constructed. Only one tooth is represented on the cylinder by the dotted lines, to show the position of the whole.—[Edinburgh Quarterly Journal of Agriculture.]

The Farmer's Magazine, conducted by the Editor of the Mark Lane Express. London.

This is a cheap quarto publication, issued in eight weekly pages, and stitched and covered. Having just finished reading the greater part of the Magazine for the years 1832 and 1833, we shall now lay before our readers abridged notices and extracts that we deem of interest to our readers.

The **WELSH PONY** is one of the most beautiful little animals that can be imagined. He has a small head, high withers, deep, yet round, barrel, short joints, flat legs, and good round feet. He will live on any fare, and can never be tired out.

WHEAT.—The red lammas wheat, red straw, or red ear, is reckoned by many farmers the best of all the sorts hitherto known, yielding the finest and whitest flour.

Velvet wheat yields also much white flour, is thin skinned, less subject to mildew and blight than other wheat, as the downy hull appears to protect it. It is grown much in the Isle of Thanet, on the sea-coast.

USE OF THE BRAMBLE.—This shrub, which we are in the habit of despising, and which is only used by the chance passenger, occasionally plucking its fruit, possesses, however, several advantages which deserve our attention. Its roots, when dried in the shade, cut into small fragments, and taken in the shape of a weak infusion, form one of the best specifics against obstinate coughs. Its long branches can in cases of need be used as cords, and its fruit produces an excellent wine, the mode of making which is as follows: "Five measures of the ripe fruit, with one of honey, and six of wine, are taken and boiled, the froth is skimmed off, the fire removed, and the mixture being passed through a linen cloth, is left to ferment. It is then boiled anew, and allowed to ferment in a suitable cask. In Provence, bramble-berries are used to give a deep color to particular wines"—[From the German.]

THE TURNIP FLY.—In an address before the Northamptonshire Farming and Grazing Society, we find it recommended to collect small heaps of rubbish around the turnip-patch, and

in two or three days after sowing, to set one or more of them on fire, first having sprinkled some sulphur on them. The wind will carry the smoke over the patch, and either kill or drive away the turnip fly.

FLESH COLORED CLOVER—*TRIFOLIUM INCARNATUM*.—This grass, as an object of field culture, was, within a few years, brought to the notice of the British public by two English tourists reporting what they had seen in Germany. Two acres, sown on stiff red clay in the middle of April. "The spring was exceedingly dry, and yet it was fit for cutting in six weeks after it had been sown, and a most luxuriant crop it was."

M. Dombarle states in the *Annales Agricoles de Revier*, that he has had five years' experience in cultivating it, and considers it of the highest value. It is an annual, and gives only one cut, yet this one is equal to two of red clover. It is not fastidious as to soil—stands the winters of the North of France, and is usually sown in August and September. "The quantity of seed is about twenty-five ounces per acre." The British code of agriculture states, that "it produces two excellent crops in one year, the first of which should be cut as soon as it comes into flower, and the second will produce a considerable quantity of seed. From a communication in the *New-England Farmer*, of Dec. 4, 1833, by the Honorable John Lowell, we make the following extract. Speaking of seed presented to the Mass. Horticultural Society, by the Honorable Thomas H. Perkins, he says,

"I sowed it about the last week of April. It was in bloom and fit to cut in fifty days. It is not so coarse as Dutch red clover, better furnished with leaves, not liable to lodge or lose its leaves in drying. It furnished a fair second crop in the late uncommon dry season."

"From its rapid growth I think it of great value for an early crop, for soiling in summer, or for supplying food when other grasses are winter killed."

"It is only an annual grass, and therefore can be of no use but for these occasional purposes; but for milk farms to supply the market, or for small dairies on estates round great towns, I think it promises to be highly useful. I have requested my friend Mr. Perkins to import fifty pounds, for myself and a friend, and he has ordered a quantity for himself, which are now on their passage. We shall be able to make a more extensive trial next summer, the result of which will be made known."

The seed may be had of H. Huxley & Co. No. 81 Barclay street, New-York; and of W. R. Prince, Flushing, New-York. One of the writers remarks that care should be had to obtain good seed, and not to sow it too deep.

DRAFTING SHEEP.—Good management of sheep and lambs requires several drafts.

"The next drafting takes place among the fat sheep in Spring which had been fed on turnips. If they are to be sold on the ground to a dealer, a few of the worst should be drafted, and sold separately, otherwise they will assuredly be made the occasion of lowering the price of the rest; and if they are destined for a public weekly market, more care is necessary for the proper assortment of them. They will have to be put into lots of half a score, or a score, according to their strength or number, and each lot marked by a distinct mark on the wool with red or blue paint."

THRASHING.—In some of the parishes of England, flails are substituted for machines—supposing them, all things considered, cheaper.

SALT.—Fine particles of salt soften the most stubborn soils, and enable the farmer to till them in the driest weather.

CATTLE IN ENGLAND.—Our readers have an example in the following extract, of the great increase that is given to human sustenance by improvements in live stock :

A century ago, our cattle, from the inferiority of their food, were not one-half, sometimes even not one-third, of the present weight. It is computed that England and Wales now contain, at least, five millions of oxen, and a million and a half of horses, of which about a million are used in husbandry, 200,000 for pleasure, and 300,000 are colts and breeding mares. The number of sheep is about twenty millions, and eight million lambs. The number of long-wooled sheep, is about five millions, their fleeces averaging 7 to 8 lbs.; and of short-wooled sheep fifteen millions, the weight of fleece averaging from 3 to 3½ lbs. The whole quantity annually shorn in England is from eighty to eighty-five millions of pounds. The Merinos were introduced about the beginning of the present century, and were imported in large numbers after our alliance with Spain in 1809. The great pasturage counties are Leicester, Northampton, Lincoln, and Somerset; and for butter and cheese, Cheshire, Gloucestershire, and Wiltshire. The import of butter and cheese from foreign countries is checked by duties, but these are important articles of Irish commerce with England.

Cultivation of Silk at Mansfield, Connecticut.
By B. STORRS. To the Editor of the New-York Farmer.

MANSFIELD CENTRE, Ct. Dec. 18, 1833.

DEAR SIR,—Yours of the 30th ult. has remained so long unanswered that you may think me indifferent to the subjects of your inquiry. Not so, sir; I feel a deep interest in the growing prosperity of our country, in its various and multiplied manufacturing establishments, which are constantly springing into existence, and in none more so than in the production and manufacture of silk; none which presents in my estimation greater encouragement, both to the agriculturist and the manufacturer—none which promises fairer to become of extensive utility and profit to this country.

With regard to the cultivation of the mulberry and the growing of silk in this place, it may not be generally known that the business has been successfully prosecuted here for more than seventy years; but, though gradually increasing during this period, there has been but very little improvements in the method of conducting the business, or in the application of the raw material to manufacturing purposes, any further than the production of sewing silk and twist, and this almost exclusively confined to the labor of the family, upon the domestic spinning-wheel. But one thing has been abundantly demonstrated; that is, that the white mulberry is easily cultivated, and that the rearing of the silk-worm, and the production of silk, notwithstanding all the particularity, minuteness, and mystery, with which the subject has been treated, and invested, may be profitably pursued, with but little more knowledge or care than is requisite for the successful rearing of pigs, or poultry. Shelter them from cold, storms and wind, and feed them when hungry, whether it be in a corn-house, barn, cider-mill house, or laboratory, built on purpose for the business, a profitable crop of silk may be produced. I would not by this remark be thought to undervalue enterprise and improvement, or to treat lightly particular attention to conveni-

ence and neatness in every branch of agriculture. I highly value all the associations and societies of the present day, formed for the advancement and improvement in knowledge of the mechanic and agriculturist; but describe to a person entirely unacquainted with the manner in which wool is produced, the animal which produces it, and inform him how this animal must be reared, fed, housed, and treated, according to the practice of some of our most wealthy and scientific farmers, its peculiar habits, and liability to disease in case of neglect, and he would be very apt to conclude, that, being unable to sustain the necessary expense, he might as well not attempt to rear an animal that required so much care and labor. So with regard to the rearing of the silk-worm, there is reason to fear that the minute particularity and delicate attention to temperature, food, cleanliness, &c. &c. with which the subject has been treated by most writers, may have deterred many from engaging in it; but let them be told, and truly too, that without thermometer, hot-house, stove-room, or laboratory, the silk-worm may be, at the proper season, hatched by the usual warmth of the kitchen; and that with a rough board to lie on, and a corn-house or barn to shelter them from wind and wet, guarded also from the depredations of rats, mice, and fowls, and well supplied with the white mulberry leaf, will produce a profitable crop of silk, they may be induced to try; and having once engaged in the business and found it practicable, may then attend to all the improvements which experience and sound wisdom may dictate. Many persons in this town, who have been for twenty or thirty years successfully engaged in the rearing of silk-worms, should you talk to them about thermometers, hot-houses, and laboratories, would not know what you meant; yet, I doubt not, a due attention to these may be profitable.

With regard to the manufacture of silk in this country, much is yet to be learned; but I consider the experiment as favorably commenced, and nothing more is wanting than that some of our enterprising and ingenious mechanics should give the subject that attention which its importance demands; and with such improvements in machinery, and the art of manufacturing, as I think the business susceptible, we may soon compete in this, as we do in some of our wool and cotton fabrics, with any portion of the world. I believe it to be a well established fact, that no part of the world now produces a better quality of the raw silk than that which is produced in this country. Since the investigation of the subject by a resolution of Congress, and the encouragement presented by the Legislature of this State, in a bounty upon the propagation of the white mulberry, and upon raw silk, the business has received a new impulse.

The Piedmont reel has been introduced, and with some improvement in the application of a stop motion. was the last season used to some extent, propelled by water and by horse power, as well as by hand, and our ingenious and industrious females find that, without any further instruction in this branch, they can, with the exercise of a little more patience than the old reel required, produce a much handsomer and more valuable article than by the former method. I have now by me a sample of a few ounces, reeled by one of our ladies, which I designed to have presented at the New-York Fair, and which I

think in every respect would compete with the production of any country. Thus far, then, I think we may safely say, we can and do succeed. We have also two small silk manufacturing establishments in this town, propelled by water power, in successful operation, at which single thrown silk, organzine, tram, and every kind of silk, is prepared with ease, by persons bred to the business. The machinery is made in the manner of the most approved English machinery. At these establishments all the silk raised in this vicinity, and reeled on the improved reel as before stated, finds a ready market. Some broad goods have been made, but the business seems not yet to be sufficiently matured to go immediately into the higher branches of manufacture, but must for a time be confined to the smaller and more common articles of silk fabrics. A great proportion of the silk now prepared at our factories here is made use of in the manufacture of the Tuscany grass bonnets.

Having extended my remarks to a much greater length than I anticipated, I will mention as an apology, that having seen most of the publications on the subject which have been circulated in this country in answer to the call of Congress for information, and being well acquainted with the perfectly simple manner in which the business has ever been conducted here, I felt that a plain statement of facts, similar to those I have here given, was necessary, to counteract in some measure the influence of that scientific minuteness with which the subject was treated in those publications, and might be of public utility. Should it appear to you that I am correct in this opinion, you are at liberty to make such use of this communication as you may think proper.

Another subject of your inquiry is, whether silk-worm eggs can be procured here, in reply to which, all I can say is, I have heretofore, when applied to, found no difficulty in obtaining them, to any extent called for, and presume there would be none now. The price, from 6 to 8 cents per thousand; and as they are attached to papers, those papers may be folded and packed in small boxes and sent safely to any part of the country by stage or otherwise.

When at New-York, last spring, I purchased a small lot of the *Morus Multicaulis*, for the purpose of introducing them into this silk-growing region. They flourished finely last summer, and if our winter climate does not prove too severe for them, bid fair to be an important acquisition to our silk growers. As I am frequently applied to from a distance for information with regard to the value of cocoons, and of the raw silk, I will here state that we have not as yet any extensive reeling establishments, but from the success which attended the trial of the Piedmont reel the last season, I think there is encouragement to enter extensively into the business, and that probably, by another season, such preparation will be made as to afford a ready sale for cocoons, at a fair price, which is now estimated by the bushel—say \$2.50 per bushel, for fair, to \$3.00 for best. The worth of the raw silk depends much on its being reeled clean, level, and fine. For the former I have paid the above prices for several lots which I purchased the last season, and for the raw silk have paid mostly from \$3.75 to \$4.00.

Respectfully, your obedient servant,

ZALMON STORRS.

NEW-YORK AMERICAN.

JANUARY 18--24, 1834.

LATER FROM EUROPE.—The George Washington, from Liverpool, brings us London papers of the 24th, and Liverpool of 26th November—ten days later than our previous accounts, though themselves 54 days old—while the latest Liverpool paper, that of 26th, announces the arrival there, of the Napoleon, in 16 days from this port.

We give from the London Spectator of the 23d a good summary of the news of the day, and add to it some details.

The quarrel in Spain is losing its interest. Neither party seems capable of any great effort; and it will probably drag on into a sort of guerilla warfare. Don Carlos still keeps concealed. The paper ruptures between the Queen Regent and Miguel signifies not much.

In Portugal the state of things is somewhat similar. Miguel, at Santarem, is so strongly posted that Pedro dares not attack him, though he has cut him off from some mills which supplied his forces with flour; but the whole country in his rear is open to him; that loss, therefore, will not be material; and if Pedro's troops are at all of the quality of those which formed a part of the detachment with which Captain Birt and his marines were acting, he shows his wisdom in not attempting any attack upon Santarem.

A quarrel, upon points of etiquette, is getting up between the self-made Soldier-King of Sweden, and the Citizen-King of the French. If in nothing else, than in the imitation of the follies of legitimacy—these new made Kings play their parts, as though they were born to them. The Bavarian Monarch, too, it seems, by the annexed article from Munich, is occupying his royal-leisure in prescribing the etiquette of the road. When the universal German mind is fermenting with thoughts and projects of equal rights and liberal institutions—such conduct as this seems really that of infatuation.

MUNICH, NOVEMBER 11.—On the 7th instant, an ordinance was published here, founded on a Ministerial rescript of the 29th of October. The first article of this ordinance forbids all carriages, no matter to whom they belong, and all riders on horseback, to pass carriages in which their Majesties are; and, when the King is on horseback, it is forbidden to pass or remain before his Majesty. The second article orders all carriages and horsemen, who may meet their Majesties, to draw up immediately, and halt till they have passed by.

In England rumors of changes in the Ministry were frequent: Lord Grey desires, it is supposed, to retire, and wishes, it is added, to make his son-in-law, Lord Durham, his successor as Premier. To this Lord Brougham, who looks to that station himself, objects. O'Connell has recommenced agitation in Ireland, having, as we presume, lost all hope of success from the Ministry.

[From the London Courier of 21st November.]

We notice in the French Papers, too, a statement that the celebrated naturalist, M. Geoffroy St. Hilaire, the President of the Academy of Sciences, was disposed to concede to M. Raspail a prize of 10,000 francs for his new system of organic chemistry, on some condition of his confining his attention to science; but the Minister, M. Guizot, interfered, and prevented it, on account of M. Raspail being, politically speaking, a dangerous citizen.—The Academy submitted to the minister's decision, not to the judgment of the man of science.

[From the London Spectator of 23d November.]

PORTUGAL.—The war in Portugal is carried on with little spirit: there is a strong disinclination to fight, on both sides. The Miguelite army remains within the Walls of Santarem; and Pedro seems to be destitute of the means of attacking it with any probability of success. He ordered a portion of his force to be drawn up below the town, by way of bravado, or in order to ascertain whether the enemy would have the folly to leave their fortifications and fight in the open plain; but the Miguelite General only laughed at him, and his troops did not move a foot.

On the 2d instant, however, there was a little fighting at Alcaer de Sal, a small town near St. Ubes, garrisoned by a detachment of the Pedroite army, consisting of about 1,000 Lisbon Militia and 150 English and Portuguese Marines. The Miguelites, in number about 1,500, under the command of Colonel Lemos, made an attack upon them early in the morning. The following account of what then took place is extracted from a letter written to Admiral Napier by Captain Birt, who commanded the Marines.

"The English and Portuguese Marines under my command were stationed in front of the Constitutional troops as skirmishers, and kept the enemy at bay till the cavalry charged them in three squadrons; when we immediately formed into a square, and twice repulsed them with great loss. We then prepared to charge a column of infantry, who were advancing; but the Portuguese Volunteers and 9th infantry, who were stationed in our rear, seeing the determined manner in which we were attacked, betook themselves to rapid flight, without firing a shot, leaving my men with some of the Portuguese Marines to do the best we could; when, finding ourselves overpowered by numbers, we commenced our retreat, keeping the enemy at bay, and covering the flight of the Portuguese. I tried to persuade the Colonel commanding our troops (who asked my opinion) to retire to a convent, a strong position on our right, at which place we might have made a good stand. Instead of doing this, he led to the marshes beside the river; and here the scene was beyond description; the whole country was strewn with arms and accoutrements, which the Volunteers threw away in their flight, and the enemy's cavalry closing on them, hewed them down in all directions. I kept my men together, and made good my retreat to the side of the river, with the loss of only three men; but on coming to the river, for want of boats (the Portuguese troops having taken all) the men were obliged to throw away their arms and accoutrements, and swim across under a heavy fire of musketry, who lined the north bank in this place. I am sorry to say my loss was great, in consequence, I fear, of some of the officers and men breaking off to the right, and attempting to pass the river lower down. They were all cut off.

The Captain adds, that the Portuguese Colonel lost all command, and gave himself up to the enemy; that a great number of the volunteers also passed, crying "Viva Don Miguel!" And that the Pedroites loss in killed, and prisoners, could not be less than 800 men. Admiral Napier, in a letter to the Minister of Marine, recapitulates Captain Birt's account of the affair; and says, that of the troops engaged on the Queen's side, he hears that "200 are at Palmella, 100 are at St. Ubes, and as for the rest, God knows where they are."

If Don Pedro's army is composed to any extent of his Lisbon levies, it is not surprising that he hesitates to attack Santarem. He had better have treated his British recruits, who lately returned in the James Watt, full of disgust and without pay, with good faith and common humanity.

SPAIN.—Mr. Villiers formally presented his credentials to the Queen Regent at Madrid on the 6th instant. Until then, Lord William Harvey had figured as the official representative or Chargé d'Affaires. At Madrid, and throughout the Southern provinces of the kingdom, the Queen's authority is undisturbed. The partisans of the Pretender are treated with some harshness.

In the Northern provinces, Carlism seems to prosper: the insurgents have driven the Queen's troops from Irun; and have thus closed another line of communication to Madrid. General Saarsfield, of whose march upon Vittoria and expected demolition of the rebels so many reports have been current, was still at Burgos, when the latest accounts left Bayonne, seven days ago. Preparations are making to supply St. Sebastian with provisions, and a number of Constitutionals have arrived there, to augment the garrison, which is weak and not well provided. There has been a rising in Valencia; the principal town in the province, San Philippe, having proclaimed Don Carlos; but it appears to have been speedily suppressed.

General Quesada, who commands the Queen's troops, at Valladolid, has issued his proclamation to the inhabitants of Old Castile. "It breathes," says the Courier, "a fierce, uncompromising war against the denounced monks and their supporters. Such sentiments must make every man apprehensive that war in Spain, instead of being a mere contest for a throne, can be nothing less than a war of extermination."

FRANCE.—The French Liberals have altered their

tone respecting the interference of their Government in the affairs of Spain. A short time ago, they were eager for the despatch of an army to support the Queen and suppress the Carlists. But they have since discovered, that the support of the Queen may be a very different affair from the establishment of a Liberal government; and have a reasonable dread that French arms, if used at all, would be for the benefit of Absolutism, or at least, what they abominate nearly as much, the system of the Juste Milieu. Now, therefore, they would prefer to assist the Queen with a loan of money; which would probably answer her Majesty's purpose much better than an auxiliary army of Frenchmen. According to present appearances, Louis Philip will do neither one nor the other.

BELGIUM.—King Leopold's concerns proceed smoothly. The addresses in reply to his speech were passed unanimously by both Chambers; and it is said that the session is likely to be one of little speechifying and much business. Count Dietrichstein, the Austrian, and Count d'Arnheim, the Prussian Ambassador, have reached Brussels. The latter is already very active in his endeavors to form a commercial treaty, the real object of which is to exclude British manufactures from the Continent. Great inducements, it is said, will be held out to the Belgian manufacturers to become parties to the Prussian system.

TURKEY.—There is a solitary piece of news from Constantinople, but that is important if true: the combined English and French squadrons have entered the Dardanelles, in spite of the recent treaty between Russia and Turkey, by which such entry was forbidden. This is a proper and spirited proceeding, and we hope that the information of the Standard, from whom we copy the news, may prove to be correct. It is far better to show at once our perfect contempt for the treaty, in this way, than get entangled in the diplomatic net of endless negotiation with a view to alter it.

IRELAND.—Having completed our budget of foreign intelligence, we turn to the far more interesting and important affairs of the Sister Isle; where, after an interval of comparative calm, the storm which we have seen gathering for some weeks past, has at length burst forth, and promises to rage with the accustomed fury of the season. It is to be hoped that the pilots to whose guidance the state vessel is consigned, are blessed with steady hands and stout hearts, for verily they will need them.

Mr. O'Connell made his appearance at the Four Courts in Dublin on Saturday last; and, with the apparent determination not to lose a moment's time, walked to his old arena, the Corn Exchange; where he drew up and signed a requisition for a public meeting to petition against Tithes and for the Repeal of the Union. This is his first step of renewed agitation in Dublin; which he has declared shall be kept up with unusual energy; and there is every reason to believe that he will keep his word.

LISBON, Nov. 16.—Very little has been done here in the military way for this last week. The contending parties continue nearly in the same positions. On the 10th instant about 6,000 men advanced towards Pernes, from Cartaxo, to destroy the mills in that neighbourhood, which supply Santarem with flour. The Miguelites, 800 in number, retired on their approach, and the Pedroites, after effecting their object, returned to their old quarters. They are drawing their line somewhat closer to Santarem; but the communication is still open with the country in the direction of Abrantes, Coimbra, and Alentejo, so that they get in provisions in abundance. Guerilla parties are going about in all directions, accompanied by a few soldiers, who forward whatever provisions they can collect to Santarem. Unless Don Pedro can send up near 10,000 men more he will not be able, effectually, to encircle the town, and of course, it will be folly to calculate on starving them out, when almost the whole country is open to them.—On the 11th inst. the inhabitants came from Alagalla, in a great hurry, as the Miguelites were drawing near the town; however, they did not enter it, as they were only in quest of cattle, and drove off about 400 head. The Miguelites who took Alcaer remain still in the neighbourhood; they did not venture to advance on St. Ubes, and the garrison is now so much increased that they will get a warm reception; had they pushed forward after the engagement at Alcaer, it was apprehended they might have effected an entry. Admiral Napier carried 400 men thither in a steamer, on the 12th, and the sailors were landed from the Donna Maria armed with pistols and boarding pikes. Napier has not since returned, and it is thought that he will take the command of an expedition to Algarve.

PURE AND WHOLESOME WATER.—This evening the Report of the Commissioners, and of their Engineer, Major Douglass, is to be canvassed by the Board of Aldermen. We hope this important topic will be approached in a proper and liberal spirit, and with an eye to the future demands, as well as present great and urgent wants of this city.

The careful and elaborate surveys made by Major Douglass, of the whole ground between the Croton river and this city, and of all the various sources whence, it was supposed, at different times, a supply of water might be derived, present the matter fully to the Board. To them it belongs to decide whether they will sanction a plan which is certain, permanent, and adequate to the future as well as present demands, and of which the utmost cost is fully set forth, and ascertained—or whether they will fritter away in doubtful experiments, and at eventually greater ultimate expense, both time and resources.

The noble aqueduct proposed by Major Douglass is, we are persuaded, the only effective, as it is the only worthy plan. We have heard no single objection to it but the apprehension that the stream might freeze. When, however, it is considered that by the descent obtained, the water at the passage of Harlem river, (the most exposed point) will run at the rate of 125 feet per minute, and in a stream varying from 4 to 6 feet in depth, there does not seem much to apprehend on the score of frost. As to the substitution of iron pipes, it is preposterous. No single line of pipes of any dimensions yet made, could supply even present wants, and the expense of several lines would be much greater than that of the aqueduct, with less certainty of result and durability. Our own thorough conviction is, that the plan of Major Douglass will, if carried out, both fulfil all expectations, and in the facilities which it will furnish to the city, not only pay for itself, but constitute a valuable source of municipal revenue.

Another Steamboat Accident.—It will be seen by the following extract from the report of the steamer Orleans, which arrived at New Orleans on the 31st ult., that the steamer Telegraph, trading from that port to Bayou Tunica, has been lost, together with the greater part of the cargo. The extract is furnished by the New Orleans Courier:

"On the night of the 27th instant, at 7 o'clock, in the bonds near the Palmyra Islands, came in contact with the steamer Telegraph, Capt. Prior. The concussion was such that she sunk in 10 minutes in three and a half fathoms water, during which time all her passengers and crew were taken from on board by us. In about three hours afterwards, the Cincinnati and North Alabamian came alongside, affording an opportunity to the passengers to proceed: of which they all availed themselves, with the exception of a few who remained on board. Shortly after both boats left the wreck. In about six hours, with the assistance of Capt. Prior and his crew, we succeeded in saving a considerable quantity of the passengers' baggage, and some of the cabin furniture. The Cincinnati brought from a neighboring wood-yard, where she heard of the disaster, a good flat boat which was left with Capt. Prior for the purpose of attending on the wreck.

Great Gale at Buffalo.—A letter from Buffalo, dated the 13th inst., furnishes the following particulars of a gale of unprecedented violence at that place. Between 4 and 5 o'clock yesterday afternoon commenced the severest gale of wind that ever visited the city, or that is known by the oldest inhabitants of Buffalo, and continued until near daylight this morning before it abated, blowing down chimneys, unroofing buildings, upsetting carriages, and blowing in windows, doors, &c. &c. It now blows a gale, and the water is 4 feet lower than it was at 3 o'clock this morning. The ice is within 10 rods of my house on Crow street. The following is a brief history of the damage:

The road is completely blockaded from the foot of Main street to the Ferry, with ice and wood and lumber. The stages have to go west through the Indian village. The water was six inches deep in Willard's store. The wharves are much injured the whole length of the creek. Some vessels broke loose from their moorings. The starboard wheel house of the steam boat N. York was blown off. A Eaton's wharf

is materially damaged. The chimneys and battlements of the Commercial Buildings are blown down, and the roofs broken in. The south end of the block on Main street is badly injured. A part of the balustrade on the Mansion House is gone. Taylor's and Hedgus on the Terrace, battlements and chimneys are gone. Elners', on the corner of Main and Seneca streets, completely unroofed. Case's Farmer's Hotel, three chimneys and battlements down. The brick front of Wilgus', on the east side of Main-st. is gone. Chimney and battlements of L. H. Pratt and the Journal office, blown down, broke through the roof and two floors below. A. and A. Raynor's roof broke in and fell to the second story; where it was propped with timbers to the risk of many lives.

The battlements, chimneys and part of the roof of Rathbun's Cremlin buildings are blow off. Some of the windows of the Baptist church blown in. All the windows of the Congregationalist's church, broken in fronting the court house square, and some on the east side. On Seneca-street, Heywood's chimneys off and Doughty's house caved in. The county poor house is unroofed and about 50 inmates unprovided for, &c. &c.—[Albany Argus.]

[From the Albany Argus.]

CANAL TOLLS.—The Canal Board have had a special meeting for the purpose of regulating the Canal tolls, and the rates are published at this early day, for the information of those who are interested in the subject.

The rates of toll upon merchandize have been reduced 25 per cent.; upon flour, salted beef and pork, butter and cheese, beer and cider, the reduction is 10 per cent.; on timber, square and round, carried in boats, the toll is reduced 50 per cent.; sawed lumber, carried in boats, is reduced from 10 to 6 mills per 1000 feet per mile. Those who are familiar with the old rates will perceive that there has been a very general reduction in the rates of toll. On most articles, the produce of the country, as well as on merchandize, the tolls by the present reduction are brought within a fraction of the constitutional minimum.

The toll upon foreign salt has been reduced from 5 to 3 cents per 1000 pounds per mile. Previous to 1831, the toll upon foreign salt was one cent and four mills. In consequence of the reduction by Congress of the United States duty, the Canal Board, in 1831, raised the toll upon foreign salt from one cent, and four mills to ten cents per 1000 pounds per mile. The constitution having been altered so as to enable the Legislature to reduce the State duty upon each bushel of salt from 12 1/2 to 6 cents, the Canal Board have modified the rates of toll upon foreign salt.

RATES OF TOLL.

At a meeting of the Canal Board, at the Comptroller's Office, in the city of Albany, on the 13th January, 1831, the following rates of toll were established, in lieu of all rates heretofore established by this Board:—

No.	Provisions.	cts. m. fr.
1.	On flour, salted beef and pork, butter and cheese, beer and cider, per 1000 pounds per mile.....	0 4 5
2.	On bran and ship stuffs in bulk, per 1000 pounds per mile.....	0 4 5
3.	On salt manufactured in this state, per 1000 lbs. per mile.....	0 2 3
4.	On foreign salt, 1000 pounds per mile.....	3 0 0
5.	On gypsum, the product of this state, per 1000 pounds, per mile.....	0 2 5
6.	On brick, sand, lime, clay, earth, leached ashes, manure and iron ore, per 1000 pounds per mile.....	0 2 5
7.	On pot and pearl ashes, kelp, mineral coal, charcoal, pig iron, broken castings and scrap iron, per 1000 pounds per mile.....	0 4 5
8.	On stove, and all other castings, going to or from tide water, per 1000 pounds per mile.....	0 5 0
9.	On copperas and magnesia, going towards tide water, per 1000 pounds per mile.....	0 5 0
10.	On bar and pig lead, going towards tide water, per 1000 pounds, per mile.....	0 4 5
11.	On furs and peltry (except deer, buffalo and moose skins) per 1000 pounds per mile.....	1 4 0
12.	On deer, buffalo and moose skins, per 1000 lbs. per mile.....	0 7 0
13.	On ship skins and other raw hides of domestic animals of the United States, per 1000 lbs. per mile.....	0 4 5
14.	On imported raw hides of domestic and other animals, per 1000 pounds per mile.....	0 9 0
15.	On household furniture, accompanied by, and actually belonging to, families emigrating, per 1000 pounds per mile.....	0 5 0
16.	On carts, wagons, sleighs, ploughs and mechanical tools, necessary for the owner's individual use, when accompanied by the owner, emigrating for the purpose of settlement, per 1000 pounds per mile.....	0 5 0
17.	On slate and tile for roofing, and stone ware, per 1000 pounds per mile.....	0 5 0
18.	On all stone, wrought or unwrought, per 1000 pounds per mile.....	0 2 5
19.	On timber, squared and round, per 100 cubic feet, per mile, carried in boats.....	0 5 0
20.	On the same, if carried in rafts, per 100 cubic feet per mile.....	1 5 0
21.	On boards, plank, scantling, and sawed timber,	

reduced to inch measure, and all sliding, lath, and other sawed stuff less than 1 inch thick, carried in boats, (except such as is enumerated in regulations, Nov. 23 and 32,) per 1000 feet per mile.....	0 6 0
22. On the same, if transported in rafts, per 1000 feet per mile.....	2 0 0
23. On sawed lath of less than five feet in length, split lath, hoop poles, rowing cars and broom handles, per 1000 pounds per mile.....	0 2 5
24. On staves and heading, transported in boats, per 1000 pounds per mile.....	0 2 0
25. On the same, if transported in rafts, per 1000 pounds per mile.....	0 5 0
26. On shingles per M. per mile, carried in boats.....	0 2 0
27. On the same, if conveyed in rafts, per M. per mile.....	0 4 0
28. On split posts, and rails for fencing, per M. per mile, carried in boats, and rafts for fencing, per M. per mile.....	2 0 0
29. On the same, if conveyed in rafts, per M. per mile.....	8 0 0
30. On wood for fuel (except such as may be used in the manufacture of salt, which shall be exempt from toll,) and tan bark, per cord per mile.....	1 0 0
31. On the same, if transported in rafts, per cord per mile.....	2 0 0
32. On sawed stuff for window blinds, not exceeding one fourth of an inch in thickness, per 1000 pounds per mile.....	0 5 0
33. On cotton, per 1000 pounds per mile.....	0 4 5
34. On live cattle, sheep and hogs, per 1000 pounds per mile.....	0 5 0
35. On horses, (and each horse when not weighed, to be computed at 1000 pounds, per 1000 pounds per mile.....	0 7 0
36. On rags per 1000 pounds per mile.....	0 4 5
37. On hemp and tobacco going towards tide water, per 1000 pound per mile.....	0 4 5
38. On hemp, going from tide water, per 1000 lbs. per mile.....	0 4 5
39. On wheat and all other agricultural productions of the United States, not particularly specified, and not being merchandize, per 1000 lbs. per mile.....	0 4 5
40. On merchandize.....	0 9 0

Articles not enumerated.

41. On all articles not enumerated or excepted, passing from tide water, per 1000 pounds per mile.....	0 9 0
42. On all articles not enumerated or excepted, passing towards tide water, per 1000 pounds per mile.....	0 4 5

Boats and Passengers.

43. On boats used chiefly for the transportation of persons and navigating the Erie canal between Schenectady and Utica, per mile.....	11 0 0
44. On boats used chiefly for the transportation of persons, and navigating the Erie canal west of Utica, per mile.....	6 0 0
45. On boats used chiefly for the transportation of persons, and navigating the Champlain or Champlain and Junction canal, per mile.....	6 0 0
46. On boats used chiefly for the transportation of persons, and navigating the Oswego canal, per mile.....	6 0 0
47. On boats used chiefly for the transportation of persons, and navigating the Cayuga and Seneca canal, and the lateral canal to East Cayuga Village, or either of them, per mile.....	6 0 0
48. On boats used chiefly for the transportation of persons, and navigating the Junction canal, and not connected with regular lines of boats for the transportation of persons on the Erie or Champlain canals, per mile.....	50 0 0
49. On boats used chiefly for the transportation of property, per mile.....	2 0 0
50. On each person over eight years of age, transported in a boat used chiefly for the transportation of persons, per mile.....	0 2 0
51. On each person over 12 years of age, transported in a boat used chiefly for the transportation of property, per mile.....	0 2 0

Resolved; That the foregoing rates of toll be, and they are hereby established; and that the same be hereafter charged and collected on the several canals of this state, in lieu of all rates of toll heretofore established upon any or either of the said canals, or any part thereof.

STEPHEN VAN RENSSELAER,
SAMUEL YOUNG,
WILLIAM C. BOUCK,
JONAS EARLL, JR.,
MICHAEL HOFFMAN,
Canal Commissioners.

A. C. FLAGG,

GREENE C. BRONSON,
A. KEYSER,
SIMEON DE WITT,
Commissioners of the Canal Fund.

[COMMUNICATED.]

A pair of silver pitchers, to be presented by the citizens of Brooklyn to Commodore Chauncey, are just finished by Gardner corner of Broadway and Liberty street, where they will remain, and may be seen for two or three days.

Appointments by the Governor and Senate—
TUESDAY, JANUARY 14.

Jonathan D. Stevenson, of the city of New York, inspector of leaf tobacco for said city, in place of Wm. Simpson, whose term of office has expired.

SATURDAY, JAN. 18.—Wm. C. Haggerty, of New York, to be auctioneer in the place of John F. Adriance, resigned.

Two of the buildings, connected with one of the Powder Mills, belonging to Loomis, Hazard & Co. in Manchester, Connecticut, were blown up on the 20th instant, (the cracking works and dry house.) Six men were killed, viz. John Rockwell, and Daniel Avery, of East Windsor; Mr. Giles, and

Mr. Bivins, of Hartford; Harvy Fox, of Bolton; Mr. Allen, of New-York—loss of property small; cause of the explosion, unknown.—(Gazette.)

JACQUELINE.

"Death lies on her, like an untimely frost
Upon the sweetest flower of all the field."

"Dear mother—is it not the bell I hear?"

"Yes, my child: the bell for morning prayers. It is Sunday to-day."

"I had forgotten it. But now all days are alike to me. Hark! it sounds again—louder—louder. Open the window, for I love the sound. There; the sunshine and the fresh morning air revive me. And the church bell—oh, mother—it reminds me of the holy Sabbath mornings by the Loire: so calm, so hushed, so beautiful! Now give me my prayer-book, and draw the curtain back that I may see the green trees and the church spire. I feel better to-day, dear mother."

It was a bright, cloudless morning in August. The dew still glistened on the trees, and a slight breeze wafted to the sick chamber of Jacqueline the song of the birds, the rustle of the leaves, and the solemn chime of the church-bells. She had been raised up in bed, and reclining upon the pillow, was gazing wistfully upon the quiet scene without. Her mother gave her the prayer book, and then turned away to hide a tear that stole down her cheek.

At length the bells ceased. Jacqueline crossed herself, kissed a pearl crucifix that hung around her neck, and opened the silver clasps of her missal. For a time, she seemed wholly absorbed in her devotions. Her lips moved—but no sound was audible. At intervals the solemn voice of the priest was heard at a distance, and then the confused responses of the congregation, dying away in inarticulate murmurs. Ere long, the thrilling chant of the Catholic service broke upon the ear. At first it was low, solemn and indistinct; then it became more earnest and entreating, as if interceding, and imploring pardon for sin; and then arose louder and louder, full, harmonious, and majestic, as it wafted the song of praise to heaven, and suddenly ceased. Then the sweet tones of the organ were heard—trembling, thrilling, and rising higher and higher, and filling the whole air with their rich melodious music. What exquisite accords!—what noble harmonies!—what touching pathos! The soul of the sick girl seemed to kindle into more ardent devotion, and to be wrapt away to heaven in the full harmonious chorus, as it swelled onward, doubling and redoubling, and rolling upward in a full burst of rapturous devotion!—Then all was hushed again. Once more the low sound of the bell smote the air, and announced the elevation of the host. The invalid seemed entranced in prayer. Her book had fallen beside her—her eyes closed—her soul retired within its secret chambers. Then a more triumphant peal of bells arose. The tears gushed from her closed and swollen eye-lids; her cheek was flushed; she opened her dark eyes and fixed them, with a deep expression of adoration and penitence, upon an image of the Saviour on the cross, which hung at the foot of her bed, and her lips again moved in prayer. Her countenance expressed the deepest resignation. She seemed to ask only that she might die in peace, and go to the bosom of her Redeemer.

The mother was kneeling by the window, with her face concealed in the folds of the curtain. She arose, and going to the bedside of her child, threw her arms around her, and burst into tears.

"My dear mother, I shall not live long—I feel it here. This piercing pain—at times it seizes me, and I cannot—breathe."

"My child, you will be better soon."

"Yes, mother, I shall be better soon. All tears, and pain and sorrow, will be over. The Hymn of Adoration and Entreaty, I have just heard, I shall never hear again on earth. Next Sabbath, mother, kneel again by that window as to-day. I shall not be here, upon this bed of pain and sickness; but when you hear the solemn Hymn of worship and the beseeching tones that wing the spirit up to God; think, mother, that I am there—with my sweet sister, who has gone before us—kneeling at our Saviour's feet, and happy—Oh, how happy!"

The afflicted mother made no reply,—her heart was too full to speak.

"You, remember, mother, how calmly Amie died. Poor child, she was so young and beautiful!—I always pray, that I may die as she did. I do not fear death as I did before she was taken from us. But, oh—this pain—this cruel pain—it seems to draw my mind back from heaven. When it leaves me I shall die in peace."

"My poor child!—God's holy will be done!"

The invalid soon sank into a quiet slumber. The excitement was over, and exhausted nature sought relief in sleep.

The persons between whom this scene passed, were a widow and her sick daughter, from the neighborhood of Tours. They had left the banks of the Loire to consult the more experienced physicians of the metropolis, and had been directed to the *Maison de Sante*, at Auteuil, for the benefit of the pure air. But all in vain. The health of the suffering, but uncomplaining patient, grew worse and worse, and it soon became evident that the closing scene was drawing near.

Of this, Jacqueline herself seemed conscious; and towards evening, expressed a wish to receive the last sacraments of the church. A priest was sent for; and ere long, the tinkling of a little bell in the street announced his approach. He bore in his hand a silver vase containing the consecrated wafers, and a small vessel, filled with the holy oil of the extreme unction, hung from his neck. Before him walked a boy carrying a little bell, whose sound announced the passing of these symbols of the Catholic faith. In the rear, a few of the villagers, bearing lighted wax tapers, formed a short and melancholy procession. They soon entered the sick chamber, and the glimmer of the tapers mingled with the red light of the setting sun, that shot his farewell rays through the open window. The vessel of oil, and the vase containing the consecrated wafers, were placed upon a table in front of a crucifix that hung upon the wall, and all present, except the priest, threw themselves upon their knees. The priest then approached the bed of the dying girl, and said in a slow and solemn tone:

"The King of Kings and Lord of Lords has passed thy threshold. Is thy spirit ready to receive him?"

"It is, father."

"Hast thou confessed thy sins?"

"Holy father, no."

"Confess thyself, then, that thy sins may be forgiven, and thy name recorded in the book of life."

And, turning to the kneeling crowd around, he waved his hand for them to retire, and was left alone with the sick girl. He seated himself beside her pillow, and the subdued whisper of the confession mingled with the murmur of the evening air, which lifted the heavy folds of the curtains and stole in upon the holy scene. Poor Jacqueline had few sins to confess—a secret thought or two towards the pleasures and delights of the world—a wish to live, unuttered, but which to the eye of her self-accusing spirit seemed to resist the wise providence of God: no more. The confession of a meek and lowly heart is soon made. The door was again opened; the attendants entered, and knelt around the bed, and the priest proceeded:—

"And now prepare thyself to receive, with contrite heart, the body of our blessed Lord and Redeemer. Dost thou believe that our Lord Jesus Christ was conceived by the Holy Spirit, and born of the Virgin Mary?"

"I believe."

"And all present joined in the solemn response—"

"I believe."

"Dost thou believe that the Father is God, that the Son is God, and that the Holy Spirit is God—three persons and one God?"

"I believe."

"Dost thou believe that the Son is seated on the right hand of the Majesty on high, whence he shall come to judge the quick and the dead?"

"I believe."

"Dost thou believe that by the holy sacrament of the church, thy sins are forgiven thee, and that thus thou art made worthy of eternal life?"

"I believe."

"Dost thou pardon, with all thy heart, all who have offended thee, in thought, word, or deed?"

"I pardon them."

"And dost thou ask pardon of God and thy neighbor for all offences thou hast committed against them, either in thought, word or deed?"

"I do."

"Then repeat after me; O, Lord Jesus, I am not worthy, nor do I merit, that thy divine Majesty should enter this poor tenement of clay; but according to thy holy promises be my sins forgiven, and my soul washed white from all transgression."

Then taking a consecrated wafer from the vase, he placed it between the lips of the dying girl, and while the assistant sounded the little silver bell, said:—

"*Corpus Domini nostri Jesu Christi custodiat animam tuam in vitam eternam.*"

And the kneeling crowd, smote their breasts, and responded in one solemn voice:—

"Amen!"

The priest then took from the silver box on the table a little golden rod, and dipping it in holy oil, anointed the invalid upon the hands, feet, and breast, in the form of the cross. When these ceremonies were completed, the priest and his attendants retired, leaving the mother alone with her dying child, who, from the exhaustion caused by the preceding scene, sunk into a death-like sleep.

"Between two worlds life hovered like a star,
Twixt night and morn upon the horizon's verge."

The long twilight of the summer evening stole on; the shadows deepened without, and the night-lamp glimmered feebly in the sick chamber; but still she slept. She was lying with her hands clasped upon her breast—her pallid cheek resting upon the pillow, and her bloodless lips apart but motionless and silent as the sleep of death. Not a breath interrupted the silence of her slumber. Not a movement of the heavy and sunken eye-lid—not a trembling of the lip—not a shadow on the marble brow told when the spirit, took its flight. It passed to a better world than this.

"There's a perpetual spring—perpetual youth;
No joint-numbing cold, nor scorching heat,
Famine, nor age, have any being there."

LITERARY NOTICES.

No. XI.

MONROE, M. T., Dec. 3, 1833.

The ride from Detroit hither is dull enough at this season of the year. The road leads through almost dead level, and the muddy streams creep over the fat black soil as if they had gormandised upon its rich vegetation till grown too lazy for locomotion. Among others, the Huron river, from which—seeing that it rises in one of the brightest and most beautiful lakes in the Peninsula—better things might be expected, waddles on to the lake as little excited by the flocks which frolic on its bosom as an Alderman after dinner by the flies that disport upon his jerkin. Occasionally, indeed, some bright little rill will ripple across the road, and smirch over its yellow pebbles on its way to the big lake, with much the same air that the mill streams of Long Island dance over the level ground while hurrying to the sea. But a wet prairie soon intervenes, and the innocent rivulet, like a child that is snubbed, becomes at once silent and sulky.—But though some parts of Wayne county are thus unattractive, I am told that other sections contain much arable land of excellent quality, consisting of sand loam and some clay with heavy timber, and occasionally fine bottoms along the streams. The population is about 8000.

The village of Monroe, in the county of the same name, from which I now write, is situated on the banks of the river Raisin, and about two miles from its entrance into Lake Erie. It was incorporated two years since, and comprizes a part of the old site of Frenchtown, celebrated, as you remember, in the annals of the last war. The place is said to be regularly laid out, but the most business part of it—and it is the fussiest little town in the world—looks as if the buildings had all been chucked from the other side of the river, and left to settle just where they might fall upon this. If the place continues to increase as rapidly, however, as it has during the last year—the population having doubled in that time—the inhabitants can afford to burn down the river side of the village and arrange it to more advantage. There are now about 150 houses, of which 20 or 30 are stone; some of them are wholesale establishments, and make a very handsome display of fancy goods. There are also two grist mills immediately in the town, a woolen factory, an iron foundry, several saw mills, a chair factory, a tannery, &c. And yet, notwithstanding the supply of water power affords every facility for the use of machinery, the demand for manual labor is very great, and mechanics of every kind may here, as in Detroit, find constant employment. Indeed, I am told, that the demand for mechanics in every part of Michigan, is excessive; and as for laborers, I have seen them repeatedly advertised for by written notices on tavern doors and elsewhere. The emigrants to the territory, I find, are generally people of a very respectable class, who have both the

disposition and the means to employ the services of others around them.

The "Bank of the River Raisin" is established at this place, with a capital of \$100,000; and though in its infancy, is said to be doing a very flourishing business. The notes are among the handsomest specimens of bank note engraving I have seen. There is also a Land Office established here, at which the sales of public lands since last April amount to upwards of \$22,000; the sales at Detroit and White Pigeon together a little exceeding this sum. The government price of land (\$100 for 80 acres) being the same in every part of the territory, this will give you some idea of the immigration into the Peninsula.

I must not forget to mention that with a population of only 1600 souls, five religious denominations are represented in their respective clergymen at Monroe, and that three of these, the Roman Catholic, Episcopal and Presbyterian, have each a neat Church of their own. I ought to add that a newspaper, with a good circulation, is printed here.

The advantageous position of Monroe, situated as it is at the head of Lake Erie, induced the government to make an appropriation for improving the harbor, which, except that of Maumee, is the only one at this part of the Lake. The lamented Major Maurice, of the Engineer Corps, (who, you may remember, fell down and instantly expired in the act of shaking hands with General Gratiot at Washington, last winter,) and whom the inhabitants of this place speak of with the tenderest remembrance—made minute surveys of the harbor and of the different channels of the river; and the bill which has been at various times introduced into Congress for their improvement was based upon his reports. A bill was passed at the last session of Congress appropriating \$8,000 for rebuilding the pier at the mouth of the river, and also appropriating the sum of \$20,000 for a road from La Plaisance bay, through which the Raisin debouches into Lake Erie, to intersect the Chicago road, which traverses the whole Peninsula, at a point about 40 miles from here; an improvement which will open a new market to Southern and Western Michigan, and contribute of course much to the prosperity of Monroe. A bill was also passed by both houses appropriating \$15,000 for a Canal connecting the waters of Lake Erie and the River Raisin by a cut across the bar at the mouth of the latter. The money has not been expended, however, in consequence of an oversight in the engrossing clerk, which from his omitting this important item, has prevented the bill as yet becoming a law. The monies appropriated for the pier and road have already been mostly expended, and those public works are now nearly completed under the active and efficient superintendence of Capt. Henry Smith, of the Engineer Corps. When all these improvements are completed, Monroe must come in for a large share of the immense trade and commerce which must flow through the three outlets of Eastern Michigan. The mouth of the Maumee can hardly compete with it on account of the extreme unhealthiness of that swampy region; but I am inclined to think that the enterprising inhabitants of this thriving little place are somewhat too vivacious in their expectations, when they think of not only rivaling, but outstripping, the ancient city of the Straits on the onward road to prosperity. Detroit, like every other point selected by the French on the Western waters of our country, is as commanding a position, whether for war or trade, as could be chosen.

The Monroites are however a driving people in their way. They are now building a steamboat of the largest class, which will cost not less than \$45,000, to ply directly between here and Buffalo, and this morning I saw launched a beautiful schooner, for the lake navigation. It was the first launch that had ever taken place at Monroe, and the occasion caused a general turn out of the inhabitants, who hurried to the spot a mile or two off upon horses of every variety of appearance. There was the bull-necked French pony and his scraggy looking Indian cousin, the sleek spongy looking Ohio horse and the clean-limbed quickly-gathering Kentuckian, galloping between the swift but shuffling Illinois pacer and the high-actioned tight looking New York trotter. Every one rode as if for a wager, and when we drew our reins the talk about horse-flesh superseded almost the interest in the schooner, showed that the Monroites, like Catalino and N. Purdy, deserve to be celebrated for their judgment in these matters. A very good and full band of Amateur Musicians composed of respectable private individuals of the village, came at last upon the ground, and changed the subject to the name of the new vessel which seemed to alter before launching, from the hackneyed one of Diana to the more characteristic sound of Tecumseh, the spot being so celebrated in the

memory of that great chief. "You know Tecumseh then sir," said I to an old gentleman, who, I was informed, had been field officer during the late war, and engaged in several battles. "I did sir, and he was as thorough a gentleman and as high toned an officer as any in the British service." The chief, you know, actually held his commission as a general officer immediately from the king. "What do you think then sir of his massacre upon this spot," I rejoined. "The barbarity of that act, sir, was only in accordance with Indian ideas of warfare. The disgrace of it attaches entirely to the English officer (Proctor) who permitted, perhaps sanctioned, the atrocity. The old officer's blood seemed to kindle anew as he dwelt upon that horrible slaughter of a force which had capitulated on honorable terms with a full reliance on the foe for protection. I asked him about the sick and wounded, who were burnt up in the hospital or shot to death as they ran shrieking through flames. "I saw their bones," he replied, when the ruins were still recent.—I came on with the corps of Kentuckians which advanced soon after into this country, and subsequently so eagerly avenged their countrymen at the battle of the Thames. I walked to the spot where the wounded met their fate, with several others. Richard M. Johnson was one of the number. We looked into the pit, and could see the charred bones and dismembered limbs and sometimes half burnt bodies, plainly below. The men muttered the deepest curses. Col. J. spoke not a word, but the tears rained from his eyes like water, and turning away, he exclaimed, "There lies the best blood in Kentucky, poured out like water." I have given as nearly as I can the very words of the veteran Colonel in describing this sad spectacle. Of the 700 young men murdered here, the greater part were students at law, young physicians, and merchants, and the sons of opulent farmers, and in short the very flower of the youth of Kentucky. The event threw the whole of that State into mourning. Speaking of the troops who were concerned in the early operations of these regions, I have heard a number of interesting accounts from different persons of the formation of the several corps. One of these, though I may very probably in trying to recall the particulars, confound them with the incidents of another, I will venture to repeat. A graduate of Williams's College, Massachusetts, who had been recently admitted to the bar, was riding through the State of Kentucky, perhaps with the design of finding some favorable point at which to fix his abode and commence the practice of his profession, when he was accosted near a village by a mounted traveller, who mentioning that he was a planter of the country, invited the young advocate with all the freedom of Western hospitality to dine at his house the following day. The invitation was accepted; and the Eastern gentleman arriving at the mansion of the unknown host, found a large party collected, the majority of which were well acquainted with each other, while many were strangers, like himself, and invited apparently in the same manner. The dinner however was got through with sociably enough; and by the time the glass began to circulate freely, all felt that easy confidence in the fellowship and good feeling of each other which is the soul of good society. The host then rising, described briefly the state of the Northwestern frontier, and produced a commission from his pocket to raise a corps and march at once thither. They enlisted to a man; their entertainer provided them on the spot with the necessary stores and munitions, and the band of volunteers started in a few hours on their march to the border.

The name of the noble host was not mentioned, but the Eastern adventurer, who was elected a Lieutenant upon the spot, and soon after became a Captain, was said to have been better known since as Colonel, General, Governor, and lastly Mr. Secretary Cass.

I regret now that I did not inquire into and note down the names and other particulars of a relation so striking, but you have the tale as it was told in my hearing, minus the admirable manner of the relation, but I am forgetting the Diana—that burst of music tells that she begins to move on her ways—calmly now she slides like a pair of Broqua's slippers through a quadrille, and now as that bottle of Champagne foams over her bow, her motion increases almost to the velocity of a gallop. She touches the water and the waves smoke like the pocket of Papa when his prettiest daughter is launched into society.—What a sensation does she make among the waves, and how do they coquet with her on every side. She bobs about till she seems as unstable as themselves. But now the sober Skipper, like a good husband, takes possession of her virgin charms, and placing himself at once at the helm, the unmeaning waters

cease their flirting, and sustain her above them without daring to attempt influencing her course. Diana, for one who has been "out" so short a time, may be said to have made "a good match," and become "a respectable member of society." To complete this truly Homeric parallel, I must add that she will "see company" at Buffalo in the spring.

The ride to these dock-yards is rather pleasant; But I have seen handsomer rivers than the Raisin. The banks for several miles around the village have been almost denuded of trees, and the limestone channel lets off so much of the stream through its crevices, that, like a tankard of liquor passed round at a tavern, it is half drunk up before it gets to its real owner, the lake. It would delight an eastern farmer though, to see the magnificent pear trees which, tall as the trees of the forest and containing a century of growth, extend through orchards for miles along the stream. Here, too, are apple trees, to the excellence of whose fruit I can testify, that were brought by the French to this country in 1731. The grape vines, too, from which the river takes its name, constitute a beautiful feature in the level landscape, as they hang in rich festoons along the banks of the stream, and climb wherever it is wooded to the tops of the loftiest elms.

There is now an application and great interest making to incorporate a company for the purpose of improving the navigation of the River Raisin and the Saline by a lock and dam navigation, an improvement which it is said can be now made at slight expense. The river flowing gently in its channel, with banks equally graded, seems ready to receive and freight upon its bosom the rich products of the country on its borders. By constructing a tow-path, the expense of which will not be heavy, an excellent canal can be easily made.

The subject of Canals and Railroads awakens at this moment the keenest interest in Michigan; and, after the route of the projected grand communication between Lakes Erie and Michigan, through the peninsula, shall be determined upon by the General Government, I have no doubt but that large and advantageous outlays of private capital upon similar works will be made at other points. Of the plans talked of as best worthy the attention of Government, that of a grand Railroad from Chicago to Detroit, with a lateral one perhaps to Monroe, seems to be considered as the least chimerical; though there are not a few who advocate a Canal immediately across the peninsula, in a direct line, from the mouth of the Maumee to Lake Michigan; and still a greater number who urge the construction of one from the mouth of the Raisin to that of the St. Joseph's, on the opposite side of the Peninsula—a route which would pass through a country acknowledged, I believe, to be the most fertile in Michigan. But another project still remains, as feasible, or perhaps more so, than either of the these. It is to connect the Washtenong or Grand river—a noble stream, which waters half the territory, and is navigable nearly 240 miles in bateaux—with the Huron, a fine stream, which after rising within a few miles of the sources of the Washtenong, empties into Lake Erie on the opposite side of the Peninsula. You can hardly form an idea of the relative importance and feasibility of these projects, without more knowledge of the territory of Michigan than is common at the east, where people generally know about as much of it as they do of Timbuctoo. I have already been so fortunate in my opportunities of talking with well informed people here, that I might venture at once to give you a general view of the country; but I prefer that you should gather whatever information I have to give from my own actual observations made along the road. With regard to scenery, I do not think, from what I have yet seen, I can promise you much; but for agricultural and mineral resources and for manufacturing and commercial advantages, I think I can produce some data, which, if they do not astonish our good people at home in regard to Michigan, will at least account for the immigrants here-pouring into the territory as they do, and believing it to be the garden of the Union. You must, however, pick up your information as I shall, by jogging along quietly with me through the country, and observing matters and things just as they come beneath our eyes. To-morrow I start for the interior. Farewell.

A TREATISE ON ASTRONOMY, BY SIR JOHN W. F. HERSCHEL, &c. &c.: Philadelphia, CAREY LEA & BLANCHARD.—This is an admirable book. It is the work of a master, and a very thorough master, of his lofty science, using his vast attainments and great powers of mind, to simplify and explain to unlearned disciples, the wonders, the truths, and the certain.

ies of astronomy. It is not, strictly speaking, an elementary book, for it assumes, necessarily, a partial knowledge, on the part of the student, of plain and spherical geometry and trigonometry; yet such is the precision of the language, and clearness of the descriptions employed, that with attention, an intelligent mind, though not possessed of this previous knowledge, will, we are quite satisfied, find no difficulty in comprehending and profiting by the instruction of this—again we repeat it—admirable volume.

OBSERVATIONS ON THE METEORS OF NOVEMBER LAST, by DENISON OLMSTED, *Prof. Math., Yale College.*—This paper, prepared for the forthcoming No. of Prof. Silliman's Journal of Arts and Sciences, but which has kindly been put into our hands in a separate shape, presents in a connected form all the various accounts of that wonderful phenomenon—the falling stars—which, according to the temper and wisdom of hearers, excited the admiration or alarm of the people of this continent and the adjacent isles.

It is however not yet finished, and to its sequel we shall look with interest for some rational and plausible theory, explanatory of so striking and rare an occurrence.

EUPHEMIA OF MESSINA; A TRAGEDY. Translated from the Italian of SILVIO PELLICO. New York: MONSON BANCROFT.—The name of Silvio Pellico would alone suffice to give to this publication general circulation. When to that is added the fact, that his tragedy is rendered into English blank verse, by one evidently master of both languages, and capable of entering into, and fully appreciating, the original, the success of the translation cannot be doubtful. We presume we are indebted for it to the same skillful and tasteful hand, which, in the American Monthly Magazine, so successfully treated the subject of Italian Poetry and Literature. We conclude our necessarily brief and hasty notice to-day, with the annexed extract from the New York Mirror:

[From the New York Mirror.]

DESCRIPTION OF A BALL ON BOARD THE FRIGATE UNITED STATES: by N. P. Willis.

Trieste.—The guns were run out of the ports; the main and mizen-masts were wound with red and white bunting; the capstan was railed with arms and wreathed with flowers; the wheel was tied with nosegays; the American eagle stood against the mainmast with a star of midshipmen's swords glittering above it; festoons of evergreens were laced through the rigging; the companion on way was arched with hoops of green leaves and roses; the decks were tastefully chalked; the Commodore's skylight was piled with cushions and covered with red damask for an ottoman; seats were laid along from one cannonade to the other; and the whole was enclosed with a temporary tent lined throughout with showy flags, and studded all over with bouquets of all the flowers of Illyria. Chandeliers made of bayonets, battle lanterns and candles in any quantity were disposed all over the hall. A splendid supper was set out on the gun-deck below, draped in with flags.—Our own and the Constellation's boats were to be at the pier at nine o'clock to bring off the ladies; and at noon every thing promised of the brightest.

First, about four in the afternoon, came up a saucy-looking cloud from the westernmost peak of the Friuli. Then followed from every point towards the north, an extending edge of a broad, solid black sheet which rose with the regularity of a curtain, and began to send down a wind upon us which made us look anxiously to our ballroom bowlines. The midshipmen were all forward, watching it from the fore-castle. The lieutenants were in the gangway, watching it from the ladder. The commodore looked seriously out of the larboard cabin port. It was as grave a ship's company as ever looked out for a shipwreck.

The country about Trieste is shaped like a bellows, and the city and harbor lie in the nose. They have a wind that comes down through the valley, called the "bora," which several times in a year is strong enough to lift people from their feet. We could see by the clouds of dust on the mountain roads, that it was coming. At six o'clock the shrouds began to creak; the white tops flew from the waves in showers of spray, and the roof of our sea-palace began to

shiver in the wind. There was no more hope. We had waited even too long. All hands were called to take down chandeliers, sword-stars and ottomans, and before it was half done, the storm was upon us, the bunting was flying and flapping, the nicely chalked decks were washed with rain, and strewn with leaves of flowers, and the whole structure, the taste and labor of the ship's company for two days, was a watery wreck.

Lieutenant C——, who had had the direction of the whole, was the officer of the deck. He sent for his pea-jacket, and leaving him to pace out his watch among the ruins of his imagination, we went below to get early to bed and forget our disappointment in sleep.

The next morning the sun rose without a veil.—The "blue Friuli" looked clear and fresh; the south-west wind came over softly from the shore of Italy, and we commenced retrieving our disaster with elastic spirit. Nothing had suffered seriously except the flowers, and boats were dispatched ashore for fresh supplies, while the awnings were lifted higher and wider than before, the bright-coloured flags replaced, the arms polished and arranged in improved order, and the decks re-chalked with new devices. At six in the evening every thing was swept up, and the ball-room astonished even ourselves. It was the prettiest place for a dance in the world.

The ship has an admirable band of twenty Italians, collected from Naples and other ports, and a fanciful orchestra was raised for them on the larboard side of the mainmast. They struck up a march as the first boatful of ladies stepped upon the deck, and in the course of half an hour, the waltzing commenced with at least two hundred couples, while the ottoman and seats under the hammocloths were filled with spectators. The frigate has a lofty poop, and there was room enough upon it for two quadrilles after it had served as a reception room. It was edged with a temporary ballustrade, wreathed with flowers and studded with lights, and the cabin beneath (on a level with the main ball-room) was set out with card tables. From the gangway entrance, the scene was like a brilliant theatrical ballet.

An amusing part of it was the sailors' imitation on the forward decks. They had taken the waste shrubbery and evergreens, of which there was a great quantity, and had formed a sort of grove, extending all round. It was arched with festoons of leaves, with quantities of fruit tied among them; and over the entrance was suspended a rough picture of a frigate with the inscription "Free trade and sailors' rights." The fore-castle was ornamented with cutlasses and one or two nautical transparencies, with pistols and miniature ships interspersed, and the whole lit up handsomely. The men dressed in their white duck trousers and blue jackets, and sat round on the guns playing at draughts, or listening to the music, or gazing at the ladies constantly promenading fore and aft, and to me this was one of the most interesting parts of the spectacle. Five hundred weather-beaten and manly faces are a fine sight anywhere.

The dance went gaily on. The reigning belle was an American, but we had lovely women of all nations among our guests. There are several wealthy Jewish families in Trieste, and their dark-eyed daughters, we may say at this distance, are full of the thoughtful loveliness peculiar to the race. Then we had Illyrians and Germans, and, Terpsichore be our witness—how they danced! My travelling companion the count of Friuli was there; and his little Viennese wife, though she spoke no christian language, danced as feely as a fairy. Of strangers passing through Trieste we had several of distinction. Among them was a fascinating Milanese marchioness, a relative of Manzoni's the novelist, (and as enthusiastic and eloquent a lover of her country as I ever listened to on the subject of oppressed Italy,) and two handsome young men, the counts Neipperg, sons-in-law to Maria Louisa, who amused themselves as if they had seen nothing better in the little duchy of Parma.

We went below at midnight to supper, and the ladies came up with renewed spirit to the dance. It was a brilliant scene indeed. The officers of both ships, in full uniform, the gentlemen from shore, mostly military, in full dress, the gaiety of the bright-red bunting, laced with white and blue, and studded, wherever they would stand, with flowers, and the really uncommon number of beautiful women, with the foreign features and complexions so rich and captivating to our eyes, produced altogether an effect unsurpassed by any thing I have ever seen even at the court fetes of Europe. The daylight gun fired at the close of a gallopade, and the crowded boats pulled ashore with their lovely freight by the broad light of morning.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,				Flat Bars in lengths of 14 to 15 feet counter sunk holes, end cut at an angle of 45 degrees with splicing plates, nails to suit.	
300	do.	1 1/2	do.	do.	
40	do.	1	do.	do.	
800	do.	3	do.	do.	
800	do.	2 1/2	do.	do.	
soon expected.					

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

The above will be sold free of duty, to State Governments, and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.

Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 55 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewin & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1853.

To Messrs Ewin & Heartt.—As you have asked me to give my opinion of the merits of these instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

[FOR THE NEW YORK AMERICAN.]
GREENOUGH.

"With looks flung back and lips apart,
"Like monument of Grecian art."
In that hushed hour of deep suspense—
Where soul is hanging on the tone,
Rapt inspiration's notes dispense,
We see thy hand upon the stone,
Whose cold and formless mass must give
The feelings of a nation's heart;
The pride, the type, and bid it live
A monument of deathless art!
Well may thy modest head be bent,
Though genius bids thee banish fear;
The blush she has, thy features lend,
Is not less graceful than the tear;
For well thou know'st no borrowed aid,
No Grecian chisel can be thine;
Its bright creations all must fade,
Before thy subject, truth divine!
No fancy here may recklessly dwell,
Or bring chimeric forms to view;
Its dreams to bright perfection swell,
And demi gods once more renew.
Still kindling men's whispers thee,
Rude as this marble lay thy land,
Ere waked to light and liberty
By thy great model's sacred hand.
Rest! then his spirit on the stone—
Thy art must call from seeming death
Its power, and beauty blend in one,
Our Hero's, and our Sculptor's wreath!

M.

January 22, 1834.

DIED

Another Revolutionary Hero gone!—Died, at Raleigh, in North Carolina, on the 14th instant, deeply regretted, Colonel WILLIAM FOLK, in the 74th year of his age. The deceased was amidst the band of Patriots who declared Independence in Mecklenburg county, in that State, on the 20th of May, 1775.—At the commencement of the Revolution he was appointed a subaltern officer in the regiment of the South Carolina line, commanded by his father, General Thomas Polk, and at the close of the war he held the rank of Lieutenant Colonel in the North Carolina line, having, except during a nine months' confinement from a severe wound, been in active service during the whole of that memorable struggle. He was present at the battles of Camden, Eutaw, Brandywine, and Germantown, and in the last, was a second time severely wounded. At the battle of Guilford, which occurred during a short interval in which he was out of command, he was actively engaged as a volunteer. The Colonel was the sole surviving Field Officer of the North Carolina line. At the close of the Revolution, he became a member of the Society of Cincinnati; and in 1791 was appointed by General Washington, Supervisor of the Revenue for the District of North Carolina, which he held till the termination of the Excise System; and at the establishment of the State Bank of North Carolina, in 1810, he was appointed President of that Institution, and for ten years, presided over that Institution with great credit to himself, and usefulness to the State.

At the commencement of the late war, he was appointed by President Madison, a Brigadier General in the Army of the United States, which for reasons then well known to the public, he declined to accept.

The Colonel has left behind him, numerous family connections and friends to deplore his loss. He has left behind him a large property, principally in valuable western lands.

SALES OF REAL ESTATE AT AUCTION.

By JAMES BLECKER & SONS.

Lot on the N W corner of Gouverneur and Madison street, 20 by 50 feet \$1,600
Three story brick house and lot 38 Carmine st, 18 by 80 ft. 3,300

FOR SALE.

ATLANTIC JOURNAL AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Rafinesque, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. dedicated to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 100 plates, containing also the economical properties of 500 genera of American plants. \$3.

MANUAL OF AMERICAN VINES, and Art of Making Wines, with 8 figures. 25 cents.

FISHES AND SHELLS OF THE RIVER OHIO. 1 dollar.

AMERICAN FLORIST, with 36 figures—price 36 cts.

* * Orders for these works, or any other of Professor Rafinesque's, received at this office. A9 tf J M M & F

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent), are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersunk heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janniers, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes. J25 lam

H. BURDEN.

GRACIE, PRIME & CO. having this day taken into co-partnership JOHN CLARKSON JAY, will continue their business under the same firm.—New-York, 1st October, 1833.

TO STEAMBOAT COMPANIES.

PROFESSOR RAFFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid. 81 R J M M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. K. B. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon-dale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York, {
January 22, 1833. }

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes. WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of this kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
German. and Norrist. Railroad.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 24, 1833.

For further information on this subject see No. 49, page 72 of this Journal.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, FEBRUARY 1, 1834.

Those of our subscribers to whom bills are enclosed, will do us a great favor by remitting the amount by mail, or by an *early* private hand, as prompt pay only, can sustain the Journal. Subscribers residing in the city will be called upon in the course of the ensuing week.

To those who have so promptly and liberally remitted for the present, or third, and in some cases for the fourth volume, and in almost every instance free of postage, we tender our thanks and best wishes.

We acknowledge our obligation to those who render us so much aid by frequent interesting communications ; yet we wish them and others to recollect, that they are at the same time doing more for the public than for themselves, or for us. A continuance of their favors is earnestly requested. Communications on any of the various subjects treated of in the Journal, are respectfully solicited.

The Saratoga and Schenectady Railroad Company have declared a dividend of *four* per cent., payable on the 10th of February. For a particular account of that road, its cost, condition, &c., see page 51 of this number.

The following evidence of the value of lime as a preservative of timber exposed to the weather, or embedded in the earth, is from an Engineer of great experience. It affords additional evidence, if any were necessary, of the correctness of the theory of our esteemed correspondent G., as published in

our last. As the preservation of timber used for railroads is a matter of so much importance, we would recommend that a thorough test should be made by some of our railroad companies, where their rails come in contact with the earth. It might be used to great advantage, we think, in the construction of railroads on the plan of ELISHA JOHNSON, Esq., as adopted on the Buffalo and Black Rock railroad—a description of which will be given in our next. This plan is, we think, peculiarly adapted to many parts of this country, especially where timber is cheap, and where it is essential to accommodate the inhabitants of the country through which it passes, and who would be best accommodated by using their own teams upon the road—a measure which would render railroads a convenience to individuals, and neighborhoods through which they pass, as well as profitable to the stockholders ; and at the same time remove one of the greatest objections, in the minds of many, to railroads—*monopoly*.

The plan of Mr. Johnson, as explained to us, consists in two longitudinal sills of, or about, twelve inches diameter, with one side made flat, embedded in, and the worked side even with, the surface of the earth, which is made level between, and on the outside of, the sills ; upon which is to be placed a covering of 2½ inch plank, 7½ feet in length ; and upon the plank, and over the centre of the sills, is to be laid a 4 inch scantling to receive the iron, 2½ by ½ inch, which is to be secured by spikes passing through the iron, scantling and plank into the sill beneath, thereby connecting and securing the whole by the same operation.

This plan will undoubtedly find favor, if any mode can be devised, at small expense, to preserve the timber ; and *time*, we have good reason to believe, will be found to answer that purpose. If so, we may have railroads at small cost, and in many places where they are not now even anticipated.

A plank covering, properly laid down, may be made water tight, so as to preserve the earth beneath *always* in a *dry* state, which will, of course, according to McAdam's theory, render it competent to sustain any burthen that ordinary business, either with animal or steam power, may bring upon it.

To the Editor of the American Railroad Journal :

SIR—I am induced to communicate a fact corroborative of the opinion of your correspondent G., in the 3d number of the 3d volume of your Journal, that lime is a preserver of tim-

ber. Some fifteen years ago a friend of mine removed a decayed mill trunk in order to replace it with a new one. The trunk had been laid under ground, and when it was covered with earth, a few scattered lumps of lime were accidentally thrown upon it. On its removal, it was discovered that every part of the wood which was in contact with lime was as perfectly sound as it was when it was first laid, whilst every other part was more or less decayed. Indeed, those parts exhibited a freshness and soundness which were truly remarkable.

XENOPHON.

Capt. Davis Embree, of Cincinnati, Ohio, has furnished us with the following description of an improvement in low water boats, that he is about to put in operation on the Ohio. He says he can lessen the draught of water at least *one-fourth*, while he retains the usual strength, speed, and convenience for freight and passengers. He says he will at the same time introduce the principle of the *life-boat*, and render it almost impossible to sink the boat by snags, rocks or waves.

The boat he is about to build will be 135 feet in length, and 24 feet wide ; the hull will be 3 feet 3 inches deep. The beam of the boat will be shaped like the bowl of a table spoon, so as to rise over the water. Twenty-six feet from the stern there will be a recess on each side, of 6 feet for the wheels to work in. The boat will be reduced there to 12 feet wide. Aft of the wheels there will be a clean run, and transom stern. This narrow part is intended to bear up the wheels and other machinery, and to furnish room for a stern castle, with its capstan, anchors, and other rigging, so essential on that part of the boat, as well as on the bow, when a boat is run in low water. By this arrangement, the wheels of the boat can be thrown out of gear, as well as other side wheels ; they have all the advantage of working in eddy water, or a counter current, of the stern wheel. They have not the propensity to *break down* the stern of the boat, which is always attendant on wheels placed *behind* a boat. That part of the hull, which would otherwise be weak, in consequence of the recesses, will be supported by the cylinder timbers, and the bulk-heads under them.

The hull of the boat will in the first place have three main bulk-heads, running nearly

its whole length, which will divide it into four parts: these bulk-heads will be made of 1½ inch pine; they will be notched over the floor timbers and be fastened to the bottom plank; they will extend to the deck: there will then be ten cross bulk-heads, made of inch pine, placed 9 feet apart, made also water-tight, which will make forty water-proof rooms, 6 feet wide, 9 feet long, and 3 feet 3 inches deep. There will be in each of these rooms two stanchions, placed 3 feet apart, and 3 feet from the bulk-heads, upon the floor timbers, and under the beams. Thus there will be a bearing at every 3 feet in every direction throughout the boat, between the bottom and deck. Then, to secure it more firmly, there will be 160 tie-bolts passed through the bottom, along side of the bulk-heads, and through the deck. This arrangement will give such great strength, that the timbers may be small; they will be made of selected young white ash, as tough as whip stocks. The floor and upright timbers will be but 3½ inches square. The beams (except for the boilers and wheels) will be 2½ inches thick and 4½ wide, bent over the main bulk-heads, and made to extend about 1 foot over the sides of the boat, to form a narrow guard. The bottom plank will be 2 inch oak; the side plank the same; the deck will be 1½ pine; the timbers or scuppers, to drain the bilge water to the pump, will be made by grooves in the bottom plank, so as not to weaken the timbers. The floor or bottom of the boat will be nearly flat, the nuckle nearly square, the sides will flare but 4 inches outwards. There will be small hatches into each room of the hull, to go into it, to stop scuppers or leaks, when required, so that if a snag run through the boat in any direction, so as even to destroy ten of these rooms, there will be still thirty left to buoy up the boat. She cannot sink but by great negligence. This is perhaps the most important feature presented by the plan; but when, in addition to this, we have a boat of full strength and speed, and containing all the usual convenience for freight and passengers, improved from 25 to 30 per cent. in draught of water, we have all that could be reasonably looked for. The boat is supposed to draw but 15 or 16 inches of water with her wood and water aboard, and then it will take nearly six tons to sink her one inch.

The hull will not be suitable or convenient to carry engine, freight, or passengers, within its body. It will be a single buoyant mass, made of light and strong materials; it will be a mere *float*. The first or lower deck will be appropriated for engine and freight, the upper deck for passengers; the cabins will be 16 feet wide, with an outer guard on each side 4 feet wide; the ladies' cabin will be 18 feet long; the main cabin will be 33 feet; the office and pantry 6 feet, and the room for crew and deck passengers 30 feet, with a guard in front. The engine will be of common construction; the boilers will be placed near the middle of the main bearing part of the hull. There will be two boilers, 40 inches diameter, 19 feet long; two flues, each, 15 inches in diameter; the cylinder will be 16 inches diameter, with 4½ feet stroke of piston: it will have a slide valve and puppet cut off. The water wheels will be 13 feet in diameter, with a bucket 6 feet long.

Report of Ephraim Beach, Esq., Civil Engineer, to the President of the Great Au-Sable Railroad Company.

TO JOHN T. NORTON, Esq., President, &c.

Sir,—I beg leave to state, that on a late excursion to Port Kent and Keeseville, at the solicitation of several gentlemen of great respectability, my attention was called to an examination of the importance and practicability of a railroad communication from Port Kent into the interior, along the Valley of the Great Au-Sable River. The importance of the object being consequent upon the resources of the country to be accommodated, I gave to that subject such attention as time and circumstances permitted; the result of which may be briefly stated as follows:

From an official statement of the situation of that district in 1831, it appears that there were then in operation, and in a state of forwardness near completion, in and near the valley of the Great Au-Sable and on its tributary streams, about 70 forges, (each fire being considered a forge,) 2 furnaces, 4 grist mills; together with extensive rolling and slitting mills, chain-cable factories, nail factories, breweries, tanneries, &c., besides numerous smaller mechanical establishments appendant to, and the necessary and natural concomitants of, the larger operations.

The extensive forests, especially within the range of the State road, abound with all the various kinds and qualities of timber characteristic of the country; but that which predominates, and is most valuable for timber, is the Norway and white pine.

I cannot better describe the extensive minerals of this prolific mineral region, than by the following extract of the official report of 1831: "Within three miles of the Au-Sable River, there are two extensive iron ore beds; from one of which the ore is raised by a steam engine. At the other, the ore is separated by Browning's Patent Machine. These ore beds sell from 30 to \$40,000 worth of ore annually."

It is stated that there are also numerous other ore beds near, and accessible to the Great Au-Sable River; as also the Port Kent and Hopkinton State Road, some of which are in partial operation, with strong indications of being inexhaustible in quantity, and not exceeded in quality by the best in the world; which has been abundantly established at various establishments, especially at the Eagle Furnace in Albany. In a word, almost every mountain furnishes indications of iron ore in this peculiar region, some interspersed with other valuable mines in partial development, abounding with correspondent mill sites, affording an ample supply of water power to any extent commensurate with the growing interests of the country. To communicate an idea of the growing industry of the country, I am enabled to state, from the most respectable authority, that, in the district intended to be embraced in the report referred to above, there are *now* in successful operation more than one hundred forges; and that saw mills and other manufacturing establishments have increased in proportion; and it is probable that Agriculture will follow in the train, and keep pace with the openings made by the collier and lumberman. Mercantile establishments are also interspersed through the country, co-extensive with its growing prosperity. From the foregoing premises, the estimate of business for a railroad will be nearly as follows, viz.:

100 forges, averaging 50 tons each per annum—500 tons; 42 saw mills, at 2 tons lumber each per day, 300 days—25,200; wood, and other incidental transportation—10,000; iron ore, for exportation, say—5,000; ascending trade, merchandise, plaster paris, &c. &c. 1.8th of descending—5,850; total—50,350 tons.

From the other manufacturing establishments procuring their raw materials from the products of the country, but little additional revenue can be expected upon the road terminating at Keeseville.

In examining the route, accompanied by

the Hon. Richard Keese and William R. Peters, Esq., I traversed the ground selected for the railroad between Port Kent and Keeseville. I again examined the route more extensively and minutely, accompanied by Col. C. M. Watson. And thirdly, with John N. Macomber, Esq., the engineer, who had made a previous survey, examined all the points with his levelling instruments; and with him and Richard Keese, Esq. measured the depth of the chasm between the rocks through which the River passes, below the village of Birmingham, which, instead of 250 feet to the surface of the water (as has been erroneously stated), we found it at the *table rock*, a short distance above the celebrated high bridge, a great natural curiosity, to be only 105 feet; which satisfactorily demonstrated the correctness of the account given by Mr. Macomber in his survey of the elevations from Port Kent to Keeseville. I am therefore enabled to state, from my own personal observation, that a route can be obtained from Port Kent to Keeseville, on which a railroad may be constructed with great facility and economy, and upon a grade which, after leaving Port Kent, need not in any case exceed an ascent of 25 feet to a mile.

In the plan of construction. I would recommend ascending the hill at Port Kent to the level of the Pine Plane above, (which is about 80 feet above the level of the wharf), by an inclined plane at an angle of elevation not exceeding five degrees from the horizon, which should be graded for; and upon which should be laid a double track railway, with a drum at the head; from which to suspend and take down, and up, the descending and ascending trade; which drum must be connected with a brake to regulate the speed.

From the head of the inclined plane to Keeseville, the route should be carefully surveyed, and properly located; the timber upon the line cut off or grubbed, as the case may require, and cleared 33 feet wide; and all tall trees (which by falling might injure the road,) should be cut down—the ground graded fifteen feet wide for a single track, except near the high bridge and at Birmingham, where the grade should be widened, and a double track laid for the accommodation of those, who, from business, or curiosity to examine the sublime scenery and cataracts in the immediate vicinity, may be induced to stop—as well as turnout places for cars meeting to pass each other. Timber being the staple commodity of the country, and can be procured of an excellent quality, at a reasonable price, should by all means be preferred for the superstructure.

The inclined plane at the commencement of the road at Port Kent, cannot be objectionable; inasmuch as there can be no doubt of there being at all times sufficient descending trade to draw up the ascending—of course, the plane will be self-acting, dispensing with all expensive and hazardous machinery; and if at any future period, the ascending trade should increase to the extent, that the descending shall be insufficient to preponderate, a small but durable stream of water, which passes near the contemplated location of the head of the plane, can with a trifling expense be introduced upon it, and made available in propelling the descending train.

Estimate of Cost of Construction.—For grading the first three miles from Port Kent, at \$2000 per mile, \$6000; 4th mile, passing high bridge and Birmingham, and crossing the river, 4000; 5th mile, from Birmingham to Keeseville, 3000. Total, \$13,000.

Cost of one mile of superstructure, viz. 10,560 lineal feet white pine setts, 6 by 8, at 3 cents a foot, \$316 80; 1760 cedar ties, 8 feet long, 6 in diameter, 6 cents, 105 60; 3520 wedges, one cent, 35 20; 10,560 lineal feet Norway pine, 6 by 6, 3 cents, 316 80; 18 tons iron rail plates, 2 by 1-2 inch, at \$45, 810 00; half ton spikes, \$80; half ton connecting plates, \$60, 140 00; labor putting down superstructure, 960 00. Total, \$2684 40

Cost of 5 miles of superstructure, \$13423 00. For double and lateral tracks, add half a mile superstructure, \$1342 20.

Cost of railroad from Port Kent to Keeseville, \$27,764 20; for engineering, superintendence, &c. &c., 15 per cent., 4164 63; 20 transportation cars, at \$100, is 2000 00; 2 passenger cars, at \$500, 1000 00. Cost of road and vehicles of transportation, ready for operation, \$34,928 83.

From the account of the resources of the annual tonnage to and from the navigable waters for the Au-Sable Valley, is 50,850 tons; but as it is probable that some portion of the business will be transacted through other channels, and to guard against possible errors, we will assume only one half as a safe calculation for the business of the railroad—say 25,425 tons, at the low rate of 6 cents per ton per mile, \$7,627 50; 40 passengers per day (20 each way) 312 days, at 25 cents a passenger, 3,120 00. Total, \$10,745 50.

Suppose the perishable materials of the superstructure to require renewing once in five years, and the cars once in five years, is equal to an annual expense of \$1,597 92; superintendents, horses, drivers, &c., 2,000 08. Total, \$3,597 92—leaving for the nett annual proceeds of the road, \$7,149 58, applicable to the payment of dividends to the stockholders, or upwards of 20 per cent. per annum on their investment.

It will be perceived that the transportation cars (could they be kept in constant employment, would be competent to do four times the business calculated, should they be loaded but in one direction. And one passenger car would do six times the business calculated; yet I think it would be proper to make such provision, to be prepared for any emergency.

Although a railroad from Port Kent to Keeseville would alone be a profitable investment, it would also be an entering wedge to an extension up the valley of the Au-Sable, at least to the Forks (15 miles from Port Kent), which would greatly increase the business on the lower part of the road, and be of incalculable advantage to the manufacturers, in addition to conveying their products to market, by increasing the facilities for the delivery of wood, coal, ore, and other materials, to their establishments; and probably at no distant period form an important link in the contemplated chain of railroad communication between Boston and Ogdensburgh. I am, respectfully, your humble servant,

EPHRAIM BEACH,
Civil Engineer.

Newark, Nov. 23, 1833.

Report of the Committee on the Affairs of the Saratoga and Schenectady Railroad. Presented 4th December, 1833.

The following report of the condition, prospects, &c. of the Saratoga Railroad Company, was furnished us several weeks since, but was accidentally omitted.

To the President, &c.

The Committee appointed by a Resolution of the Board of Directors, held the 28th of September, 1833, to investigate, &c., the affairs of the Company, submit the following Report:

That soon after their appointment, two of your Committee, accompanied by an intelligent gentleman, who has acted in the capacity of Secretary, repaired to the spot, and after several weeks of unremitting attention to the important trust confided to them, have at length been enabled to bring their labors to a close, so far as relates to the present administration of the Road, and also in reference to its future prospects. The Committee, in order to lay before the stockholders a faithful and correct expose of the present condition of the concerns of the Company, together with a prospective view, have carefully and thoroughly examined the various points which the Report embraces, and have the satisfaction to believe that the

results will prove gratifying to all those having an interest in the welfare of this incorporation.

The duties of the Committee, as they conceive, were necessarily divided into two distinct parts. Firstly: The actual condition of the Road, the examination of the accounts for moneys received and disbursed in conducting its active operations from the opening, the appointment of suitable agents, &c., regulating the affairs of the Road in all its various branches, and estimating its present and future resources.

Secondly: In relation to the contracts for completing the different sections of the whole line of Road, their fulfilment, the expenditures for construction, examination of vouchers, and every thing touching the faithful performance of the duties assigned to the agents, engineers, &c. As this part of the investigation would, from the great mass of papers to be examined, consume more time than was at first anticipated by the Committee, they have confined themselves, in their present Report, to the first branch of the inquiry.

The Saratoga and Schenectady Railroad Company was incorporated in February, 1831, with a capital of \$150,000, with the privilege of increasing it to \$300,000. The amount was soon subscribed, and the company organized the same year. The road was commenced about the 1st of September, 1831, and was so far constructed by the 12th of July, 1832, as to be opened for the partial transportation of passengers: the whole line of the rail, however, was not laid till late in the spring of this present year. At the time of applying for the charter, it was contemplated that a cheap structure would have answered the purposes required, but it was subsequently determined, from the prospect of a greater amount of business than was at first anticipated, that a more permanent and substantial one was advisable, both on the score of economy as well as utility. By a report of John B. Jervis, Esq. chief engineer of the Company, presented at a meeting of the Board of Directors, held on the 16th of May, 1832, containing an estimate of the probable cost of the Road, it appeared that the farther sum of \$100,000 would be required over and above the amount of the capital at that time, to complete the Road, including the necessary appendages to put it into active operation. It was accordingly resolved, at a subsequent meeting of the Board, held 18th of May, that the capital stock of the company should be increased that amount, which was all subscribed for, making the entire capital at that time, \$250,000, and subsequently, in the fall of last year and spring of this, the capital was increased to \$285,000. This sum was considered amply sufficient to place the Road in the most perfect condition; but unforeseen circumstances have caused some farther expenditures to complete the Road, and procure the necessary means to conduct its future operations to advantage. The aggregate amount of expenditures for constructing the Road, appears to be \$297,237. The Committee have the pleasure to announce its entire completion, and that it is now in excellent order, and hereafter will only require for ordinary repairs, according to the estimate formed, the annual expenditure of \$3,000.

The Road commences at Schenectady, where it joins the Mohawk and Hudson Road, at its termination on the western inclined plane, passes the canal over a bridge, through the city of Schenectady, then over the Mohawk river, through the towns of Glenville, Clifton Park, Ballston, and the village of Ballston Spa, and terminates in the central part of the village of Saratoga Springs. The route is almost an uninterrupted level, there being no greater inclination than sixteen feet in a mile.

The Committee, in order to be made thoroughly acquainted with the state of the Road, employed a respectable mechanic of this city to inspect all the masonry, walls, culverts,

bridges, &c., and to furnish the Committee with his views in relation thereto. His report is presented. Since then, the unfinished work mentioned therein has been completed.

The Company are now amply supplied with every thing necessary for transporting, the ensuing year, three times the number of passengers that have passed over the Road the present year, and also for transporting, when the contemplated increase of wagons are provided, 20,000 tons of merchandize and produce.

The receipts of the Road, from its commencement to the 30th of November, inclusive, amount to \$16,990 92.

The Committee, in the progress of their duties, were desirous to place the affairs of the Company on such a solid footing as would best secure the interests of stockholders, and have therefore adopted such measures as they believed calculated to produce so important a result. Their attention was particularly called to the imperfect regulations that existed in conducting the active operations of the Road, and also in relation to its financial concerns; they considered an improvement would be effected by having but one general agent or superintendent over the whole line of Road; in the place of two that were then acting with equal powers, and have accordingly appointed Mr. John Costigan, recently of this city, a gentleman disengaged from all other business, and willing to devote his whole time and attention to the concerns of the Company, possessing, in the opinion of your Committee, all the requisite qualifications to fulfil the duties of that office.

In advertent to the financial department, the Committee would observe, that although the funds of the Company were intrusted in the hands of those of unquestionable responsibility, yet it was believed a change might be made that would be more in conformity to what is adopted by other incorporations in relation to this subject, and prove more satisfactory to stockholders.

The Committee have accordingly concluded an arrangement with the Schenectady Bank to receive the gross amount of moneys belonging to the Company, (from whatever source they may be derived,) to be drawn for according to the regulations that may be hereafter adopted by the Board.

The Committee, believing that a system of collections, differing from that which has been hitherto pursued, might be formed, that would prove more beneficial, have adopted it accordingly.

In deliberating on the foregoing subjects, your Committee were led to consider the advantages that would result by establishing a set of by-laws, to govern the proceedings of the Company, which they herewith submit for the consideration of the Board.

The attention of the Committee was next turned to the subject of the future prospects of the Company, which occupied a considerable portion of their time; and they are gratified to find it presents a very encouraging aspect. In addition to the summer and local travel, there is, in the opinion of your Committee, a wide field opening in the direction of the North and West, for extensive business in the transportation of passengers and freight. There have been various estimates formed as to the amount of northern business travel; but it has been ascertained, from authentic sources, that at least 30,000 persons pass each way, in the course of the year, during the opening of navigation on Lake Champlain, who have heretofore taken what is termed the "River Route;" and, from the measures already pursued by the Committee in order to secure this travel, it is confidently believed that a large proportion of this number will in future select the route of the Railroad. The ordinary time to perform the journey, by the stage route, from Whitehall to Albany, is from 12 to 14 hours. By the Railroad, it could be easily accomplished in 10 hours, including the necessary stoppages; fur-

nishing a much more easy and expeditious mode of conveyance.

The Committee have given publicity to the permanent arrangements of the Road for the transportation of passengers, &c., by advertising in the newspapers in the northern and western parts of this state, and in Vermont and Canada; which means of making known to the public the facilities offered by the Railroad appear to have been heretofore, in a great measure, overlooked. The Utica and Schenectady Railroad, now about being constructed, it is believed, will materially add to this branch of business. The Committee have received a written communication from the Commissioner of that road, expressive of his views on the subject.

An arrangement has been completed with the Mohawk and Hudson Railroad Company for a continuous line of transportation, for passengers and freight, between Albany and the Springs; thereby avoiding the inconvenience and loss of time heretofore experienced in changing the carriages and baggage cars at Schenectady. The utility of this arrangement will be duly appreciated by those who have passed this route previous to this regulation: it has given very general satisfaction, and the beneficial results have been already witnessed by your Committee.

The transportation of merchandize and produce has also claimed particular notice and attention. It appears to be divided into two branches, viz.: the exports, consisting principally of the products of the forest, sawed timber, and other articles enumerated, which gives the amount of 19,150 tons; the imports, consisting of foreign merchandize for the consumption of the surrounding country, and of products from the west, the most important item of which is plaster, amounting itself heretofore to at least 3000 tons per annum. This will be augmented in a very great degree; as previous to the construction of the Railroad, this article, from its heavy cost of transportation, was introduced but to a limited extent. From the facilities now afforded, many proprietors are induced to cut the wood and clear the land for the purposes of culture; and the time is not far distant when this portion of the country, hitherto almost secluded from participating in the benefits of commerce and agriculture, will rise into notice.

Already the transportation of goods from the Hudson river has commenced under the most favorable auspices, being conveyed in much less time, and at a cheaper rate, than via canal. Within the last month, freight destined for Saratoga, which was formerly conveyed in the canal to Schenectady, and then placed in freight wagons, is now taken from the foot of the eastern inclined plane of the Mohawk and Hudson road, at the wharf, and conveyed to Ballston and Saratoga in the same wagons; and is also returned in the same manner. It is to be observed, that a considerable portion of the line of this Railroad is distant 12 miles from any canal, which gives it a decided advantage in the transportation of freight, particularly in the article of wood for fuel, which hitherto could only find a home market to a limited extent, the cost of the ordinary mode of conveyance precluding it being sent to a more distant one.

The Committee do not consider it as any exaggeration to say, that the receipts from transportation of freight alone, which has heretofore received but little attention from the Company, may be made to pay all the expenses of the general operations of the Road; leaving the receipts from passengers as net profits.

The Committee were gratified to see, on the 21st ultimo, the article of anthracite coal conveyed from the Hudson river, at the foot of the inclined plane, over the two Railroads to the vicinity of Ballston Spa, to be used for manufacturing purposes, for which large quantities will be required.

(To be concluded in our next.)

THE GENESEE AND ALLEGANY CANAL.

(Continued from page 4.)

Report from the Canal Commissioners, pursuant to the act entitled "An act to provide for the Survey of certain Canal Routes therein mentioned." Made to the Assembly March 6, 1826.

To the Legislature of the State of New-York:

The Canal Commissioners, in obedience to the provision of an act entitled "an act to provide for the survey of certain canal routes therein mentioned," have caused surveys and examinations to be made of the most eligible routes for navigable communications, in the following places, to wit:

From the Seneca lake to the Chemung river.
From Syracuse to Port Watson.

From Chenango point, by the town of Norwich, to the Erie canal.

From the valley of the Unadilla to the Erie canal.

From the Cayuga lake to the Susquehannah, near Owego.

From the Erie Canal in the county of Herkimer, to the St. Lawrence.

From the Erie canal at Rome, by Boonville, to Ogdensburg.

From the Erie canal at Rome, by Camden, to Ogdensburg.

*From Rochester to the Allegany river, by various routes.

*From the Erie canal to the Allegany, by Batavia.

*From the Erie canal to the Allegany, by the valley of the Conawanga.

*From Portland on lake Erie, to the head of Chataque lake.

2 From the Champlain canal to the Vermont line, by various routes.

From Gravesend Bay, through the bays on the south shore, to the east end of Long Island.

From Schoharie creek to the valley of the Catskill.

Messrs. Geddes, Roberts, Thomas, Hutchinson, Young, Whippo, and Sargent, were the engineers employed to survey the above mentioned routes; their reports, maps and estimates, are herewith transmitted, and will furnish the legislature with the necessary information on the subjects to which they respectively relate.

The foregoing surveys, and the one submitted a few days since, of the route from "Sharon or near thereto, to the tide waters of the Hudson," are all the routes comprised in the above mentioned act, excepting a short route from Rochester to lake Ontario.

SAMUEL YOUNG,
HENRY SEYMOUR,
WILLIAM C. BOUCK,

6th March, 1826.

GENESEE CANAL.—A Canal from Rochester to Genesee will pass over a country so favorable to the making one, that notwithstanding the valuable river navigation now used between these places, an artificial canal will undoubtedly be accomplished. The route of a canal may follow a track almost as direct as a road along the river.

From the upper end of the feeder to Genesee, will be about 27 miles, the making of which will cost less perhaps than any 27 miles of canal ever did, exclusive of lockage. The rise from the Erie canal to Squawkey hill is 68 feet, to Genesee feet.

At Squawkey hill, a smooth surface gives place to the narrow defile, the deep chasm, and the frowning precipice.

From below Smith's mills in the town of Nunda above the great falls, [the river enters at country of tremendous gulfs, passing down cataraacts, and through rapids, falling 453 feet to Gardeau flats, thence running rapidly to Squawkey hill with a fall of 76 feet more.

To make a canal which will have in it this 529 feet of lockage, it must pass the first falls below Smith's mills in the river bed, defended by masonry until it gains the table land immediately below, where the face of the country

will admit of its leaving the brow of the gulf below, and by some deep cuttings through points of hills, pass on to a very smooth faced country of clay soil, over which a canal can be conducted down the hill to the river near Mount Morris.

Sixty-six locks, of 8 feet lift each, will have to be placed in a space not exceeding nine miles, allowing something more than a furlong to each lock.

Following up the river from Smith's mills to the mouth of Black creek 22 miles, the valley is free from high precipitous rocky shores, but some obstructions by slip banks of clay occur in several places. To secure against those slips is sometimes difficult, and great disasters are often occasioned by them. Excepting these threatening slips, the valley is favorable to the making a canal in it. The lockage in this 22 miles is 162 feet, not quite an eight feet lock to a mile.

Following up the valley of Black creek, another rapid rise takes place. In three miles there will be 17 eight feet locks: some rocks on the falls on Black creek, but they are of a loose texture, and their removal will not be expensive. They are a yellow sand stone, in which shells of numerous varieties are embedded.

From these falls seven miles to the summit, the surface is smooth, but the earth is filled with loose stones, producing most unpleasant roads along the valley.

The whole rise from the Erie canal to the summit is 981 feet. On this summit, between Genesee and Allegany waters, there lies a swamp, about two miles in length. This swamp, which is in some places open, and in some places timbered, drains into Black creek, and into Oil creek. It will be profitable to cut down this summit eight feet in the deepest place, and the lockage is so calculated.

This summit pound must be extended down the north side of Oil creek valley to its junction with Ishua creek, where, from a feeder of two miles in length, the whole of the Ishua creek can be received into the summit level.

The length of the summit will be eight miles; it will pass down the Oil creek valley with facility, not running much on the face of the steep hill, although the junction of the streams is 41 feet below said summit level.

The whole fall to Allegany at the mouth of Olean creek, is 78 feet—whole lockage ascending and descending, 1,059 feet.

The length of canal to be made from the upper end of the feeder near Rochester to Olean, will vary little from 100 miles. The lockage is equal to 132 eight feet locks on this canal of 103 miles, measuring from the Erie canal to Allegany river. The Union canal, now making in Pennsylvania, between the Susquehannah and Schuylkill, is 75 miles long, with 90 locks. As 75 is to 90, so is 103 to 123, exceeding the proportion to the Union canal by 9 locks.

A passage from the Ohio valley to the Genesee valley is here 1488 feet above tide level, and is less elevated than any passage that has been examined, either to the Potomac or to the Susquehannah valleys. The canal proposed from the Conamau to Juniata, through a tunnel four miles long, is (taking "the level that has been assumed") 1831 feet above the tide,"* an elevation of 343 feet more than the pass to Genesee valley, which will be without tunnel or deep cutting.

But from examinations made by Mr. Whippo, there is a passage found up the Conawanga valley, the summit 724 feet above the level of lake Erie. Add 570 feet, the elevation of lake Erie above the ocean, and said summit stands but 1294 feet above tide level—194 feet lower than that of Oil creek and Genesee. Mr. W. gives the fall to Warren, in Pennsylvania, in 24 miles, 132 feet. Pittsburgh being 756 feet above tide level, it results, that there is but 406 feet rise from Pittsburgh to Warren. The length of a canal from Buffalo to Warren he

* See report, &c. of the commissioners, &c. printed at Harrisburgh, 1825, page 40.

makes 89 miles. In this 89 miles the lockage will be 724 feet up, and 132 down, equal 856 feet, making 107 eight feet locks in 89 miles. The lockage on the canal here proposed, when compared with its length, bears a remarkable comparison with the Union canal—75 miles is to 90 locks, so is 89 miles to 107 locks. This summit pound can be fed from the Chataque lake, which was styled by Mr. Gallatin "an extensive and important elevated reservoir."

The Oil creek and Black creek summit has some peculiar features. At the mills of Cady and Baldwin, on Oil creek, which is the highest point from which arks and rafts have been sent, the high floods flow over the intermediate ground, (a marsh,) and pass to the gulf of St. Lawrence instead of the gulf of Mexico. Permanent streams of each pass in the marsh within twenty chains of each other.

The Oil creek descends with a moderate current to the Ishua, in which distance are three saw mills that would lose all their water by a canal.

Lime, which abounds at Batavia and a small distance south, has been found lately south of Perry village, but a little west of the Genesee river, on a very high level. The earthy lime is found in many places near the proposed canal line, particularly at Lime lake, which is proposed to be brought into the Ishua, to feed the upper level of this canal.

A summit pound here would be abundantly supplied with water. The drainage of 190 miles of surface can be turned into it. See map No. 10, where this tract is marked out by a red dotted line. Mr. Roberts gives the following account of the capacity of the streams in October last.

Ishua creek at Farewell's mills—cubic feet per minute. 750

Lime lake, Beaver lake, and Peacock lake, which can be brought through feeders into the Ishua, (see map No. 5.) 400

Oil creek,† 450

Together per minute, 1600

The four feeders shown on map No. 5 are, together, 11 miles long, which may be valued as so much canal.

Estimates then will be on

111 miles canal, at \$5000 per mile, \$555,000

1059 feet of lockage, at \$150 per foot rise, 158,850

Extras for passing Genesee falls, 30,000

Deep cutting on the summit two miles long, deepest eight feet, 12,320

Deep cutting on Lime lake feeder, one mile ten feet, 10,560

To secure against slips on Genesee river, 30,000

Aqueduct over Canastota, 10,000

Dams at Conesus and Honeyoe outlets, 2,000

Dam on Genesee river at the mouth of Black creek, 2,000

Amounting to \$810,730

For superintendence and engineers, add 8 per cent, 64,858

Total amount, \$875,588

* Gallatin's report, &c.

† Mr. Roberts made Oil creek at its mouth 551 feet; about 100 feet perhaps cannot come into the summit pound.

[To be continued.]

GREAT RAILROAD MEETING.—At a meeting of citizens of the counties of Ontario, Livingston and Genesee, held at Haxton's Hotel, in the village of Caledonia, on Wednesday the 15th day of January, 1834, for the purpose of taking into consideration the propriety of making application to the legislature of this state, now in session, for an act of incorporation to authorize the construction of a Railroad from Buffalo, through Batavia, Le Roy, Caledonia, Avon and Canandaigua to Geneva, the Hon. MOSES ATWATER, of Canandaigua, was called

to the chair, and GEO. W. CLINTON, of Canandaigua, and LANSING B. MIZNER, of Geneva, were appointed Secretaries.

The object of the meeting having been briefly stated by H. J. Redfield, Esq. it was, on motion.

Resolved, That a Committee of five be appointed to prepare resolutions for the consideration of the meeting. Whereupon David Hudson, of Geneva, Heman J. Redfield and Jacob Le Roy, of Le Roy, George Hosmer, of Avon, and William Blossom, of Canandaigua, were appointed said Committee.

The Committee having retired for a short time, returned, and after a few brief and pertinent remarks from their chairman, presented the following preamble and resolutions, which were fully considered and unanimously adopted.

Whereas, in the construction of the Erie canal, insurmountable obstacles were presented to locating that invaluable improvement along the great thoroughfare between Geneva and Buffalo, whereby a very large and most valuable portion of western New-York has been, in a great measure, deprived of the immediate advantages resulting from the completion of that work;

And whereas those natural obstacles which are presented to the formation of canals, are not met with in the construction of Railroads, and it being manifest from the examinations and surveys already made, that a Railroad may be laid down from Buffalo, on a line passing through Batavia, Le Roy, Caledonia, Avon and Canandaigua, to Geneva, at an expense within the means of those who are interested in the proposed measure;

And whereas the construction of the said road, on the line aforesaid, will very greatly advance the agricultural and manufacturing interests of this part of the state; therefore,

Resolved, That it is expedient to take measures immediately for applying to the legislature, now in session, for an act incorporating a company to construct a Railroad from Buffalo, through Batavia, Le Roy, Caledonia, Avon and Canandaigua, to Geneva, as nearly on the great western thoroughfare as may be practicable.

Resolved, That a Committee of three be appointed to take the necessary steps for carrying into effect the foregoing resolutions.

Whereupon, Heman J. Redfield, of Le Roy, Jared Wilson, of Canandaigua, and George Hosmer, of Avon, were appointed said Committee.

Upon motion, it was also

Resolved, That Henry Morris, of Buffalo, Ethan B. Allen, of Batavia, Heman J. Redfield, of Le Roy, Robert McKay, of Caledonia, Curtis Hawley, of Avon, M. W. Brown, of Lima, G. W. Clinton, of Canandaigua, and L. B. Mizner, of Geneva, be appointed a Committee of Correspondence.

Resolved, That the proceedings of this meeting be published in the newspapers at Buffalo, Batavia, Le Roy, Canandaigua and Geneva, and in the Albany Argus.

MOSES ATWATER, Chairman.
GEO. W. CLINTON, } Secretaries.
L. B. MIZNER, }

RAILROAD FROM LONDON TO PARIS.—In the *Journal des Debats*, of Wednesday, we find a very able article, written by a native of France, resident in London, upon the important advantages likely to result from the formation of a railroad between London and Paris. In the estimate of the effects likely to arise from facilitating the communication between the two countries, the writer chiefly takes into consideration those that will be produced in France; and among the benefits which his country will derive from the speedy and cheap conveyance afforded by railroads, he places particular stress upon the commercial education which it will be the means of bestowing upon his countrymen. "If," he observes, "there were a railroad from

London to Paris, we Frenchmen, who scarcely know what business is, would go to learn it in London, where the spirit of business seems to be born with the people. Our speculators would there see how great undertakings are conducted simply and without diplomacy. Our retail venders and purchasers would learn from the English, that to buy and sell well it is not necessary to charge exorbitantly and to haggle for lower prices. Our capitalists and merchants would find that there is no durable commercial prosperity and no security for capital where credit is not well founded; they would see the operations of the Bank of England and its branches, and perhaps they might be disposed to introduce into their own country similar institutions, which are so advantageous both to the public and to the proprietors. We should see there in what comfort consists, so essential to the tranquillity of life, and how it may be attained. As we are a people abounding in self-love, we should return from England ashamed of the condition of our agriculture, of our modes of communication, of our schools of elementary instruction, and we should endeavor to equal our neighbors in these respects. The railway from London to Paris would thus become an institution for public education. It would constitute a commercial establishment of the first order, and it would also become a political institution, and form the elements of a close and indissoluble alliance between France and England."—[London Courier.]

RAILWAYS.—We are glad to find that the directors of the Liverpool and Birmingham railway are proceeding in the formation of their works with a degree of promptitude and activity which augurs well for their speedy completion. In the adjoining county of Chester, the cutting of the line has commenced at several points; and in that part of the line which lies between Knutsford and Mere, considerable progress has already been made; and we perceive that the directors are advertising for tenders for the erection of a viaduct over the river Weaver, in the township of Dutton, which, when completed, will be, perhaps, the most magnificent structure of the kind in the United Kingdom. It is to consist of 18 arches, each of 60 feet span, and 60 feet high; so that the Sankey viaduct will appear insignificant in comparison with it.—[Manchester Guardian.]

Application is to be made in the ensuing session of Parliament, for powers to extend the line of the Grand Junction Railway, and by means of a tunnel to connect it with the London and Birmingham Railway, at the termination of the line of the latter railroad in Nova Scotia Gardens.

A NOVEL SPECIES OF STREET PAVEMENT.—A gentleman lately from St. Petersburg describes a new and ingenious mode of paving streets, successfully tried in that capital. Instead of wrought stones or Macadam's gravel (both of which are in use there) the Russians have employed blocks of wood, we presume hard wood, set on end. They are about a foot long, by eight or nine inches broad, and are cut into hexagons, which are closely joined and fitted to each other. When seen from a window in the second or third story, they present a regular and beautifully tessellated surface, like the inlaid oak floors seen in old houses. The droskies, which, from their heaviness and the smallness of their wheels, make an intolerable noise on the wrought stone pavement, pass over the blocks of wood as quietly as if they rolled on a carpet.—[Liverpool Albion.]

A correspondent of the United States Gazette says that an arrangement has been made by our enterprising fellow-citizen, Colonel Reeside, with the Camden and Amboy Rail Road Company, for the conveyance of three mails, daily, between this city and New York. This arrangement, for which Colonel Reeside is entitled to the thanks of the public, is to go into operation in a few days.

MILL-WORK.—Under this head we purpose noticing the simplest combinations of wheel-work which are employed in the construction of mills, and, under the articles **WIND and WATER MILLS**, complete views, both graphic and descriptive, will be given of their construction.

The business of a millwright is usually combined with the practical part of engineering, and much of the wind and water power formerly employed in giving motion to machinery is now superseded by the introduction of the steam engine. Indeed, without the agency of steam power, this country could in no shape compete with other manufacturing nations; so that, on account of the great importance of the steam engine as a prime mover, it will be advisable to devote a commensurate space to its illustration.

Various are the methods by which motion may be communicated from one part of a machine to another; and much of the skill of the millwright consists in his adapting certain methods to his particular purposes. Sometimes a simple cord, or a cord with pulleys, may be used. Levers, either simple or combined, are employed to communicate and also change the direction of the motion. Rods also are employed, which may be carried to a great distance by being connected together. But of all the modes of communicating motion, that by means of wheels is the most frequent. Wheels may be made to turn each other even by the simple contact of their surfaces when pressed together; or their circumferences may be formed into brushes with short thick hair, which enable them to turn each other with considerable force; or they may have cords, or straps of leather, or chains, passing from one to another; and at other times there are points or protuberances on the rims of the wheels. The most usual method, however, of making wheels drive each other, is by means of teeth. These are either cut into the substance of which the wheel is composed, when it is of metal; or formed at the same time as the rest of the wheel, when it is cast.

The proper method of shaping the teeth of wheels, so as to communicate the motion equally, and with as little friction as possible, is a matter of very great nicety, and has given rise to much study among mechanics. The ends of the teeth should be curves, but not parts of complete circles. They may be formed of the curve called the epicycloid, or of the involutes of circles, which are curves described by a point of a thread, which has been wound round the wheel while it is uncoiled.

A wheel which has teeth cut upon the circumferences, so as to project out in the plane of its face, is called a spur wheel; and, when the projection of the teeth is at right angles to the face of the wheel, and parallel to the axis, the wheel is called a crown or contrate wheel. Sometimes the faces of the two wheels are in the same plane, and consequently the axes parallel; and at other times the axes are at right angles to each other, one being a spur and the other a contrate wheel.

There is a mode of placing the teeth frequently resorted to, which consists in leveling the edge of the wheel, and cutting the teeth on the bevel, by which they may turn in each other, though variously inclined, and the teeth have also great strength. The principle consists in the cones rolling on

the surface of each other, as in the annexed right-hand engraving; if their bases are equal, they will perform their revolutions in one and the same time.

If the cones are fluted, or have teeth cut in them diverging from the centre, they are then called *bevel gear*. The teeth may be made of any dimension, according to the strength required; and it is of great use to communicate a motion in any direction, or to any part of a building. The bevel gear represented in the left-hand figure must be supported by a frame at the point where the pivots intersect each other. The frame is usually formed of iron or wood, and when the latter is employed the pivot-hole is of brass. The perpendicular shaft should always be made to revolve on a sharp point in the centre.

Hook's universal joint, (described at page 154, vol. ii,) may be applied to communicate motion instead of bevel gear, where the speed is to be continued the same, and where the angle does not exceed thirty or forty degrees and the equality of motion is not regarded; for, as it recedes from a right line, its motion becomes very irregular. This joint may be constructed by a cross, or with four pins fastened at right angles upon the circumference of a hoop, or solid ball. It is of great use in cotton mills, where the tumbling shafts are continued to a distance from the moving power.

The employment of animal power in the simplest species of mill-work may be well illustrated by the accompanying sketch, in which a horse may be attached to a long lever, and thus made to raise a weight by a train of wheels and pinions.

The weight to be raised is suspended by a rope or chain which winds round the drum, *l*. On the same axis is placed a wheel, *i*, actuated by another wheel, *g h*. The wheel, *d e*, gives motion to the whole, by the intervention of the small wheel at *f*. A horse at *a* may be considered as the prime mover, as the lever *a b* is on the axis *c*. Now, in this apparatus, there is a loss of power, but a gain in velocity.

The various modes of constructing mills

for domestic, as well as manufacturing processes, will be explained hereafter, and we now purpose confining ourselves to a single example of the mode of employing animal power, in a way which, from its simplicity, might be adopted to a great extent in this country. There is a mill of a cheap and effective kind used in many parts of the East, which appears to have suggested the use of the ordinary snuff-mill. Indeed, it is, in some respects, superior to it. This mill, which is employed in the preparation of sugar, consists of a mortar, beam, lever, pestle, and regulator, as represented in the engraving beneath:

The mortar, *a a*, is a tree about ten feet long and fourteen inches over, which is sunk in the earth, so as to leave about two feet above ground. At the top is formed a conical cavity like a funnel, which ends in a hollow cylinder, with a hemispherical projection at the bottom, in order to allow the juice to run freely to the small opening that conveys it to a spout, *f*, from which it runs into an earthen pot. Round the upper mouth of the mortar is a circular cavity, *b*, which serves to collect any of the juice that may run over from the upper end of the pieces of cane. A channel is cut to convey this juice down the outside of the mortar to the spout, *f*.

The beam, *i*, is about 16 feet long and 6 inches thick, and is cut from any large tree that is divided by a fork into two arms. A hollow circle is made in the fork for the mortar, round which the beam turns horizontally: the surface of this excavation is secured by a semi-circle of some strong wood; the other end of the fork is left quite open, in order that the beam may be changed without any trouble. The bullock driver sits on the undivided end, to which the cattle are yoked by a rope, *l*, from his end of the beam, and they are kept in the circular tread by another rope, *m*, which passes from the yoke to the forked end of the beam. A basket, *n*, is placed upon the forks to hold the cuttings of the cane, and the man, *o*, who feeds the mill, sits between this basket and the mortar. He takes care to place the pieces of cane sloping down the cavity of the mortar, just at the time that the pestle comes round; and after the pestle has passed, he removes those which have been squeezed.

The lever, *p*, is a piece of timber nearly as long as the beam. The thickest end, which is also the lowest, is connected with the undivided end of the beam by means of a regulator, *t*. A little way from the place where it is joined to the regulator, a piece of very hard wood is morticed into the lower side of the lever, and a smooth conical hollow is made in this piece, to receive the head of the pestle. The end of the lever

furthest from the regulator is fastened by two ropes to the two arms of the beam.

The pestle is a strong cylindrical piece of timber, cut to a point at each end. The upper end is a smooth cone, the lower end a pyramid of 12 to 15 sides, at the point of which is a strong cylinder. As the pestle is placed obliquely, it rubs strongly against the sides of the mortar as it passes round; and its cylindrical point rubs also on the top of the hemispherical projection, *d*, which is in the bottom of the cavity of the mortar.

The regulator, *t*, is a strong square of timber, which passes through the undivided end of the beam, and is secured below it by part of its circumference being left for cheeks. It is pierced by eight holes, and a pin is placed in the lowest hole, to prevent the regulator from falling when the strain is removed.

The canes with which the mill is supplied are cut into pieces six inches long. The mill goes night and day during crop time, and presses about fifty-six pots, or 219 gallons of juice, in that time. Two bullocks are used at a time, and as they are driven very fast, they are changed every time three pots of juice are expressed, and work no more that day.

In the manufacture of snuff in this country, the grinding is performed by a loaded pestle, made to turn round as it rubs against the sides of a cast iron mortar, the pointed lower end of the pestle being retained in its place by a hole at the bottom of the mortar. In large manufactories, a number of these mortars are placed in a circle, having a large toothed wheel in the centre, surrounded by as many upright spindles, with pinions to work in the wheel.

Mr. Gill has proposed an improvement on this plan, which is represented beneath :

The mortar, *c*, is in this arrangement made to revolve, and the pestle, *b*, is supported by a bracket firmly attached to the beam beneath. The pinion, *a*, rests on a conical axis, and communicates, as in the old arrangement, with the principal driving wheel.

Water-mills are of three kinds: *Breast-mills*, *undershot-mills*, and *overshot-mills*, according to the manner in which the water is applied to the great wheel. In the first, the water falls down upon the wheel at right angles to the *float-boards*, or bucket, placed to receive it. In the second, which is used where there is no fall of water, the stream strikes the float-boards at the lower part of

the wheel. In the third, the water is poured over the top, and is received in buckets arranged round the wheel.

A less quantity of water will turn an overshot mill (in which the wheel has buckets instead of float-boards) than a breast-mill, where the fall of water seldom exceeds half the height of the wheel; so that, when there is but a small quantity of water, and a fall great enough for the wheel to lie under it, the bucket, or overshot-wheel, is always used; but, where there is a large body of water, with a small fall, the breast or float-board must be used. Where the water runs only upon a small declivity, it can act but slowly upon the under part of the wheel, in which case the motion of the wheel will be slow; and therefore the floats ought to be very long, that a large surface of water may act upon them, so that what is wanting in velocity may be made up in power; and then the cog-wheel may have a greater number of cogs in proportion to the rounds in the trundle, in order to give the mill-stone a sufficient degree of velocity.

It was the opinion of Smeaton, that the powers necessary to produce the same effect on an undershot-wheel, a breast-wheel, and an overshot-wheel, must be to each other as the numbers 2.4, 1.75, and 1.

Wind, which we may consider as the next substitute for animal power, appears to have been first employed to give motion to machinery in the beginning of the 6th century. The use of this species of mechanical force is, however, principally limited to the grinding of corn, the pressing of seed, and other simple manipulations, the great irregularity of this element precluding its application to those processes which require a continued motion.

A windmill with four sails, measuring seventy feet from the extremity of one sail to that of the opposite one, each being six feet and a half in width, is capable of raising 926 lbs. 232 feet in a minute, and of working on an average eight hours per day. This is equivalent to the work of 34 men, 25 square feet of canvass performing the average work of a day laborer. A mill of this magnitude seldom requires the attention of more than two men; and it will thus be seen that, making allowance for its irregularity, wind possesses a decided superiority over every species of animal labor.

The following very important errors have frequently been made by mathematicians and practical mechanics, in the estimation of the force of the wind or the water on oblique surfaces; they have generally arisen from inattention to the distinction between pressure and mechanical power. It may be remonstrated that the greatest possible pressure of the wind or water, on a given oblique surface at rest, tending to turn it in a direction perpendicular to that of the wind, is obtained when the surface forms an angle of about 55° with the wind; but that the mechanical power of such a pressure, which is to be estimated from a combination of its intensity with the velocity of the surface, may be increased without limit by increasing the angle of inclination, and consequently the velocity. The utmost effect that could be thus obtained would be equal to that of the same wind or stream acting on the float-boards of an undershot-wheel; but, since in all practical cases the velocity is limited, the effect will be somewhat smaller than this: for example, if the mere velocity of

the sails or float-boards be supposed equal to that of the wind, the mechanical power will be more than four-fifths as great as that of an undershot wheel; that is, in the case of a windmill, more than four-fifths of the utmost effect that can be obtained from the wind. In such a case Maclaurin has shown that the sails ought to make an angle of 74° with the direction of the wind: but in practice it is found most advantageous to make the angle somewhat greater than this, the velocity of the extremities of the sails being usually, according to Mr. Smeaton, more than twice as great as that of the wind. It appears, therefore, that the oblique sails of the common windmill are in their nature almost as well calculated to make the best use of any hydraulic force as an undershot-wheel; and, since they act without intermission throughout their whole revolution, they have a decided advantage over such machines as require the sails or fans to be exposed to a more limited stream of the wind during one half only of their motion, which is necessary in the horizontal windmill, where a screen is employed for covering them while they are moving in a direction contrary to that of the wind: and such machines, according to Smeaton, are found to perform little more than one-tenth of the work of those which are more usually employed. The sails of a common windmill are frequently made to change their situation, according to the direction of the wind, by means of a small wheel with sails of the same kind, which turns round whenever the wind strikes on either side of it, and drives a pinion turning the whole machinery; the sails are sometimes made to furl or unfurl themselves, according to the velocity of the wind, by means of a revolving pendulum, which rises to a greater or less height, in order to prevent the injury which the flour would suffer from too great a rapidity in the motion, or any other accidents which might happen in a mill of a different nature. The inclination of the axis of a windmill to the horizon is principally intended to allow room for the action of the wind at the lower part, where it would be weakened if the sails came too nearly in contact with the building, as they must do if they were perfectly upright. When it is necessary to stop the motion of a windmill, a break is applied to the surface of a large wheel, so that its friction operates with a considerable mechanical advantage.—[Partington's Scientific Gazette.];

SINGULARITY OF RECORDS.—There is, perhaps, no one principle in human nature that leads to greater consequences, than the concentration of application to singular research.

But this, like every other principle, has occasionally strange and useless terminations, that may be called *lusus naturæ* in mortals. As an instance of this, I will present you with the result of a man's labor for three years, eight or nine hours in a day, Sundays not excepted, to determine the verses, words, and letters, contained in the Bible.

Verses	-	-	-	-	31,173
Words	-	-	-	-	773,692
Letters	-	-	-	-	3,566,480

The middle and the least chapter is the 117th Psalm.

The middle verse is the 8th verse of the 171st Psalm.

Jehovah is named 6,855 times. The middle of these Jehovahs is in second Chronicles, fourth chapter and 16th verse.

The word *and* is found in the Bible 46,227 times.

The least verse in the Old Testament, is in first Chronicles, 1st and 10th verses. The least in the New Testament, 11th chapter of John, 35th verse.—[London paper.]

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

INTRODUCTION.

To prepare us for perceiving design in the various internal structures of an animal body, we must first of all know that perfect security against accidents is not consistent with the scheme of nature. A liability to pain and injury only proves how entirely the human body is formed with reference to the mind; since, without the continued call to exertion, which danger and the uncertainty of life infer, the development of our faculties would be imperfect, and the mind would remain, as it were, uneducated.

The contrivances (as we should say of things of art,) for protecting the vital organs, are not absolute securities against accidents; but they afford protection in that exact measure or degree calculated to resist the shocks and pressure to which we are exposed in the common circumstances of life. A man can walk, run, leap, and swim, because the texture of his frame, the strength and power of his limbs, and the specific gravity of his body, are in relation with all around him. But were the atmosphere lighter, the earth larger, or its attraction more—were he, in short, an inhabitant of another planet,—there would be no correspondence between the strength, gravity, and muscular power of his body, and the elements around him, and the balance in the chances of life would be destroyed.

Without such considerations the reader would fall into the mistake that weakness and liability to fracture imply imperfection in the frame of the body, whereas a deeper contemplation of the subject will convince him of the incomparable perfection both of the plan and of the execution. The body is intended to be subject to derangement and accident, and to become in the course of life more and more fragile, until, by some failure in the frame-work or vital actions, life terminates.

And this leads us to reflect on the best means of informing ourselves of the intention or design shown in this fabric. Can there be any better mode of raising our admiration than by comparing it with things of human invention? It must be allowed, that we shall not find a perfect analogy. If we compare it with the forms of architecture—the house or the bridge are not built for motion, but for solidity and firmness, on the principle of gravitation. The ship rests in equilibrium prepared for passive motion, and the contrivances of the ship-builders are for resisting an external force: whilst in the animal body we perceive securities against the gravitation of the parts, provisions to withstand shocks and injuries from without, at the same time that the frame-work is also calculated to sustain an internal impulse from the muscular force which moves the bones as levers, or, like a hydraulic engine, propels the fluids through the body.

As in things artificially contrived, lightness and motion are balanced against solidity and weight, it is the same in the animal body.

A house is built on a foundation immovable,

and the slightest shift of the ground, followed by the ruin of the house, brings no discredit on the builder; for he proceeds on the certainty of strength from gravitation on a fixed foundation. But a ship is built with reference to motion, to receive an impulse from the wind, and to move through the water. In comparison with the fabric founded on the fixed and solid ground, it becomes subjected to new influences, and in proportion as it is fitted to move rapidly in a light breeze, it is exposed to founder in the storm. A log of wood, or a Dutch dogger, almost as solid as a log, is comparatively safe in the trough of the sea during a storm—when a bark, slightly built and fitted for lighter breezes, would be shaken to pieces: that is to say, the masts and rigging of a ship (the provisions for its motion) may become the source of weakness, and, perhaps, of destruction; and safety is thus voluntarily sacrificed in part, to obtain another property of motion.

So in the animal body: sometimes we see the safety of parts provided for by strength calculated for inert resistance; but when made for motion, when light and easily influenced, they become proportionally weak and exposed, unless some other principle be admitted, and a different kind of security substituted for that of weight and solidity: still a certain insecurity arises from this delicacy of structure.

We shall afterwards have occasion to show that there is always a balance between the power of exertion and the capability of resistance in the living body. A horse or a deer receives a shock in alighting from a leap; but still the inert power of resisting that shock bears a relation to the muscular power with which they spring. And so it is in a man: the elasticity of his limbs is always accommodated to his activity; but it is obvious, that in a fall, the shock, which the lower extremities are calculated to resist, may come on the upper extremity, which, from being adapted for extensive and rapid motion, is incapable of sustaining the impulse, and the bones are broken or displaced.

The analogy between the structure of the human body and the works of human contrivance, which we have to bring in illustration of the designs of nature, is, therefore, not perfect; since sometimes the material is different, sometimes the end to be attained is not precisely the same; and, above all, in the animal body a double object is often secured by the structure or frame-work, which cannot be accomplished by mere human ingenuity, and of which, therefore, we can offer no illustration strictly correct.

However ingenious our contrivances may be, they are not only limited, but they present a sameness which becomes tiresome. Nature, on the contrary, gives us the same objects of interest, or images of beauty, with such variety, that they lose nothing of their influence and their attraction by repetition.

If the reader has an imperfect notion of design and providence, from a too careless survey of external nature, and the consequent languor of his reflections, we hope that the mere novelty of the instances we are about to place before him may carry conviction to his mind; for we are to draw from nature still, but in a field which has been left strangely neglected, though the nearest to us of all, and of all the most fruitful.

Men proceed in a slow course of advancement in architectural, or mechanical, or optical sciences; and when an improvement is made, it is found that there are all along examples of it in the animal body, which ought to have been marked before, and which might have suggested to us the improvement. It is surprising that this view of the subject has seldom, if ever, been taken seriously, and never pursued. Is the human body formed by an all-perfect Architect, or is it not? And, if the question be answered in the affirmative, does it not approach to something like infatuation, that possessing such perfect models as we have in the anatomy of the body, we yet have been so prone to neglect them?

We undertake to prove that the foundation of the Eddystone lighthouse, the perfection of human architecture and ingenuity, is not formed on principles so correct as those which have directed the arrangement of the bones of the foot; that the most perfect pillar or kingpost is not adjusted with the accuracy of the hollow bones which support our weight; that the insertion of a ship's mast into the hull is a clumsy contrivance, compared with the connections of the human spine and pelvis; and that the tendons are composed in a manner superior to the last patent cables of Huddart, or the yet more recently improved chain-cables of Bloxam.

Let us assume that the head is the noblest part; and let us examine the carpentry and architectural contrivances exhibited there.

But before we give ourselves up to the interest of this subject, it will gratify us to express our conviction, that the perfection of the plan of animal bodies, the demonstration of contrivance and adaptation, but more than these, the proof of the continual operation of the power which originally created the system, are evinced in the property of life,—in the adjustment of the various sensibilities,—in the fine order of the moving parts of the body,—in the circulation of living blood,—in the continual death of particles, and their removal from the frame,—in the permanence of the individual whilst every material particle of his frame is a thousand times* changed in the progress of his life. But this is altogether a distinct inquiry, and we are deterred from touching upon it, not more from knowing that our readers are not initiated into it, than from the depth and very great difficulty of the subject.

CHAPTER I.

ARCHITECTURE OF THE SKULL.—It requires no disquisition to prove that the brain is the most essential organ of the animal system, and being so, we may presume that it must be especially protected. We are now to inquire how this main object is attained?

We must first understand that the brain may be hurt, not only by sharp bodies touching and entering it, but by a blow upon the head, which shall vibrate through it, without the instrument piercing the skull. Indeed, a blow upon a man's head, by a body which shall cause a vibration through the substance of the brain, may more effectually deprive

* The old philosophers gave out that the human body was seven times changed during the natural life. Modern discoveries have shown that the hardest material of the frame is changing continually; that is, every instant of time from birth to death.

him of sense and motion, than if an axe or a sword penetrated into the substance of the brain itself.

Supposing that a man's ingenuity were to be exercised in contriving a protection to the brain, he must perceive that if the case were soft, it would be too easily pierced; that if it were of a glassy nature, it would be chipped and cracked; that if it were of a substance like metal, it would ring and vibrate, and communicate the concussion to the brain.

Further thoughts might suggest, that whilst the case should be made firm, to resist a sharp point, the vibrations of that circular case might be prevented by lining it with a softer material; no bell would vibrate with such an incumbance—the sound would be stopped like the ringing of a glass by the touch of a finger.

If a soldier's head be covered with a steel cap, the blow of a sword which does not penetrate will yet bring him to the ground by the percussion which extends to the brain; therefore, the helmet is lined with leather, and covered with hair, for, although the hair is made an ornament, it is an essential part of the protection: we may see it in the head-piece of the Roman soldier, where all useless ornament, being despised as frivolous, was avoided as cumbrous.

We now perceive why the skull consists of two plates of bone, one external, which is fibrous and tough, and one internal, dense to such a degree that the anatomist calls it *tabula vitrea* (the glassy table).

Nobody can suppose this to be accidental. It has just been stated that the brain may be injured in two ways: a stone or a hammer may break the skull, and the depressed part of the bone injure the brain; whilst, on the other hand, a mallet struck upon the head will, without penetrating, effectually deprive the brain of its functions, by causing a vibration which runs round the skull, and extends to every portion of its contents.

Were the skull, in its perfect or mature state, softer than it is, it would be like the skull of a child; were it harder than we find it is, it would be like that of an old man. In other words, as in the former it would be too easily pierced, so in the latter it would vibrate too sharply and produce concussion. The skull of an infant is a single layer of elastic bone; on the approach to manhood it separates into two tables; and in old age it again becomes consolidated. During the active years of man's life the skull is perfect: it then consists of two layers, united by a softer substance; the inner layer is brittle as glass, and calculated to resist any thing penetrating; the outer table is tough, to give consistence, and to stifle the vibration which would take place if the whole texture were uniform and like the inner table.

The alteration in the substance of the bones, and more particularly in the skull, is marvellously ordered to follow the changes in the mind of the creature, from the heedlessness of childhood to the caution of age, and even the helplessness of superannuation.

The skull is soft and yielding at birth; during childhood it is elastic, and little liable to injury from concussion; and during youth, and up to the period of maturity, the parts which come in contact with the ground are thicker, whilst the shock is dispersed towards the sutures (the seams or joinings of the pieces,) which are still loose. But when,

with advancing years, something tells us to give up feats of activity, and falls are less frequent, the bones lose that nature which would render concussion harmless, and at length the timidity of age teaches man that his structure is no longer adapted to active life.

We must understand the necessity of the double layer of the skull, in order to comprehend another very curious contrivance. The sutures are the lines of union of the several bones which form the *cranium**, and surround and protect the brain. These lines of union are called *sutures*, (from the Latin word for *sewing*,) because they resemble seams. If a workman were to inspect the joining of two of the bones of the cranium, he would admire the minute dovetailing by which one portion of the bone is inserted into, and surrounded by, the other, whilst that other pushes its processes or juttings out between those of the first in the same manner, and the fibres of the two bones are thus interlaced, as you might interlace your fingers. But when you look to the internal surface, you see nothing of this kind; the bones are here laid simply in contact, and this line by anatomists is called *harmonia*, or harmony. Architects use the same term to imply the joining by masonry. Whilst the anatomists are thus curious in names, it is provoking to find them negligent of things more interesting. Having overlooked the reason of the difference in the tables of bones, they are consequently blind to the purpose of this difference of the outward and inward part of a suture.

Suppose a carpenter employed upon his own material, he would join a box with minute and regular indentations by dovetailing, because he knows that the material on which he works, from its softness and toughness, admits of such adjustment of its edges. The processes of the bone shoot into the opposite cavity with an exact resemblance to the foxtail wedge of the carpenter—a kind of tenon and mortice when the pieces are small.

But if a workman in glass or marble were to inclose some precious thing, he would smooth the surfaces and unite them by cement, because, even if he could succeed in indenting the line of union, he knows that his material would chip off on the slightest vibration. The edges of the marble cylinders which form a column are, for the same reason, not permitted to come in contact; thin plates of lead are interposed to prevent the edges, technically termed *arries*, from chipping off or splitting.

Now apply this principle to the skull. The outer softer tough table, which is like wood, is indented and dove tailed; the inner glassy table has its edges simply laid in contact. It is mortifying to see a course of bad reasoning obscure this beautiful subject. They say that the bone growing from its centre, and diverging, shoots its fibres betwixt those which come in an opposite direction; thus making one of the most curious provisions of nature a thing of accident. Is it not enough to ask such reasoners, why there is not a suture on the inside as well as on the out?

* *Cranium*, from a Greek word, signifying a helmet. The cranium is the division of the skull appropriated to the protection of the brain; it consists of six bones—the *frontal* (or forehead); two *parietal* (walls or side bones); the *occipital* (back of the head); and two *temporal* (or temple) bones.

The junction of the bones of the head generally being thus exact, and like the most finished piece of cabinet work, let us next inquire, whether there be design or contrivance shown in the manner in which each bone is placed upon another.

Fig. 1.

A, the parietal bone; B, the frontal bone; C, the occipital bone; D, the temporal bone; E, the sphenoid bone.

When we look upon the side of the skull thus, the temporal suture betwixt the bones A and D is formed in a peculiar manner; the lower or temporal bone laps over the superior or parietal bone. This, too, has been misunderstood: that is to say, the plan of the building of the bones of the head has not been considered, and this joining, called the squamous* suture, which is a species of scarfing, has been supposed a mere consequence of the pressure of the muscle which moves the jaw.

Dr. Monro says, "the manner how I imagine this sort of suture is formed at these places, is that, by the action of the strong temporal muscles on one side, and by the pressure of the brain on the other, the bones are made so thin that they have not large enough surfaces opposed to each other to stop the extension of their fibres in length, and thus to cause the common serrated appearance of sutures; but the narrow edge of the one bone slides over the other."

The very name of the bones might suggest a better explanation. The *ossa parietalia*† are the two large bones in a regular square, serving as walls to the interior, or room of the head, where the brain is lodged. (See A, in the foregoing figure.)

* From *squama*, the Latin for a scale, the thin edges lying over each other like the scales of a fish.

† From the Latin word *paries*, a wall.

‡ In the second Treatise on Heat, the reader will find an account of the manner in which the expansion of iron by heat, and its subsequent contraction on cooling, is used in order to cog great buildings.

(To be continued.)

AGRICULTURE, &c.

[From the New-York Farmer.]

DRAINING.—In low lands, where furrows are substituted for under drainings, it is calculated that the loss of seed in the furrows, and the superiority of the crops, would, in two years, pay the expense of the draining.

SUGAR FROM BEETS.—A writer in Goodsell's Farmer, who has been engaged in constructing machinery for the manufacture of this sugar in Europe, proposes to commence business at Rochester. He makes the following calculation:

Cost of producing an acre,	\$20 00
Cost of manufacturing do.,	40 00
	60 00.
Amount of sugar produced,	151 20
Value of pulp remaining,	6 00
	157 20
Nett profit per acre,	\$97 20

The Farmer's Magazine, conducted by the Editor of the Mark Lane Express. London.
[Continued from page 42.]

TURNIPS TO THE ACRE.—Loudon, in his late tour of Scotland, says, the cultivation of turnips in rows is carried to so high a degree of perfection in Scotland, that 30 tons of Swedish turnips are calculated on to the statute acre.

BEST ROOT SUGAR.—The decrees of Bonaparte brought a hundred thousand acres yearly under cultivation of beets for sugar. A great oversight of the French government was to compel every farmer to devote a portion of his land to this root, without fixing some obligation on the manufacturers to pay a remunerating price. The consequence was, that the farmers were wholly at the mercy of the manufacturers.

"To the manufacturer, we are told, the profit was ample; an equal quantity of sugar with that of the West Indies—which at that time sold for *five shillings* a pound, could be produced on the spot from mangel wurtzel at *less than one shilling* per pound! and to such perfection had the sugar thus made arrived, that the prefect, mayor, and some of the chief persons of Bruges, who were invited by a manufacturer to witness the result of his experiments, allowed the specimens which he produced to exceed those of the foreign sugar!

"The British people are really of opinion that Napoleon's novel project *entirely failed*, and that our continental friends are still indebted to their colonies for the immense supplies of sugar they annually consume. They will be surprised to know, that not only does the manufacturer continue to thrive, but that the produce is abundantly ample to satisfy all the wants of the people, *independently of any supplies from abroad*, and that the French Minister of Commerce has deemed the time to have arrived, when beet-root sugars shall be made subservient to the fiscal necessities of the State.

"In 1823, it seems, 58 establishments for the manufacture of sugar in France were known to be in activity, and 50 more in process of construction; and it was these ascertained facts that induced the Government to reflect 'whether the time had not come for making the domestic sugars bear a part of the burden before laid exclusively upon the exotic ones.'

"In the inquiry that was instituted in 1828, when it was attempted to remove the difficulties which attended the fixing a tariff on sugars, it was stated, that 'if the tariff is not changed, and no extraordinary event happens, *five years* will be enough to enable the beet-root establishments to produce enough for the whole consumption of France! and in ten years to compete with the colonies on equal terms! or rather the colonies will not be able to contend with them; for the kilogramme of domestic sugar can then be afforded at 60 cents, i. e. the price which the sugar from the cane necessarily costs in the colony itself, and to which must be added freight, insurance, and commission.

"The manufacture of sugar from the beet-root is concentrated principally in the three departments of le Nord, la Somme, and le Pas-de-Calais, where the land is well fitted for the kind of culture which it requires. The *worst* produces 12,000 kil.* of beets per acre, (query *hectare*, 2 a. 1 r. 30 p.); the *best*, 60,000! There are some establishments in other departments, even in the South, but they are not in the way of increase, since the beets are in general in that part of France watery and barren of sugar.

"As an useful auxiliary to agriculture, this branch of manufacture is justly extolled for the excellent means which it offers for improving the soil; bringing it from the fallow, un-

productive state; and (in the opinion of a distinguished French agriculturist) as being about to produce, in the national economy, one of those happy revolutions whose importance is not always felt at the time, but which posterity will note as the cause of the greatest commercial and agricultural prosperity."

NEW-ZEALAND FLAX, *Phormium Tenax*.—This plant stands the winter of England. In 1828 only 60 tons, valued at 2,600 pounds sterling, were imported from Sydney into Great Britain. In 1830 there were 841 tons, and in 1831 1,062 tons. Its price in London is 15 to £25 per ton. The flax is prepared by the natives, and in strength and whiteness of fibre is superior to any analogous material.

FOOD FOR HORSES.—We often hear such and such food recommended, because it contains much nutritive property, chemically ascertained, without any regard to the bulk, or its adaptation to the digestive powers of the animal. One reason why oats are so much esteemed as food for horses is, that they have more bulk than most other grains. We make an extract from Mr. Dick's opinion.

"Under this view of the subject, it will be seen that a moderate proportion of nutritious food is only required, and that it is advisable to present it in as small a compass as will suit the nature of the digestive organs. But it would appear that a certain proportion of bulk is also necessary to the quantity of nutritious matter to keep up the proper action of the bowels. If the food is too rich and too much concentrated, it deranges the stomach and bowels, and produces disease; if too poor and bulky, it yields not the proper degree of support to the animal, while its bulk impedes respiration, and its weight detracts by its burdensomeness from the capability of the animal exerting himself. From these remarks, it will appear obvious that the grand desideratum is to give food containing as much nutriment, and in as small bulk, as is consistent with the economy of the animal."

CULTIVATION IN THE UNITED KINGDOM.—The following statement will be found interesting, as exhibiting the number of acres in cultivation in the United Kingdom, and the different purposes specified, for which they are employed in England and Wales, as well as the number of farms, and the annual amount of property derived from agriculture:

	Cultivated Acres.	Uncultivated Wastes.	
		Capable of Improvement.	Barren and uncultivable.
			Total.
England,	25,632,000	3,454,000	3,956,400
Wales,	3,117,000	530,000	1,105,000
Scotland,	5,965,000	5,950,000	8,523,930
Ireland,	12,525,280	4,500,000	2,416,664
British Isles,	383,000	160,000	509,400
Total,	46,992,970	14,600,000	15,871,403
			77,374,433

In England and Wales it is calculated that there are 3,250,000 acres employed in the cultivation of wheat; 1,250,000 acres in that of barley and rye; 3,200,000 acres in that of oats, beans, peas; 1,200,000 acres in that of clover, rye grass, &c.; 1,200,000 acres in that of roots and cabbages, cultivated by the plough; 2,100,000 acres in that of fallows; 47,000 acres in that of hop grounds; 18,000 acres in that of pleasure grounds; 17,300,000 acres in that of pastured by cattle; 1,200,000 acres in that of hedge-rows, copses, and woods; 1,300,000 acres in that of ways and water courses, &c.; 5,029,000 acres in that of common and waste lands. Total of England and Wales, 37,094,000 acres.

SUBSTITUTION OF INANIMATE FOR ANIMATE POWER.—This is an important subject, and will, in all human probability, effect much change in the value of horses. The Journal of Elementary Locomotion estimates, on the cal-

culatation that £216,817,624 is the value of the agricultural produce of Great Britain, the saving of upwards of 120 millions yearly, by the substitution of inanimate for animate power.

It is calculated that out of the 1,800,000 horses in the United Kingdom, that the horses used *bona fide* for husbandry amount to 852,663. To these we will add 88,512, being the half of the number estimated as *not wholly* used for the same purpose.

The annual keep of ditto at £29 14s. per head, amounts to	£24,097,837 10 0
Duty upon ditto	725,433 5 0
Interest upon these items, at £5 per cent.	1,241,163 0 14
Add the 14th part of £10, 818,298 13s. 4d. the capital sunk in the above horses, at the average of £13 6s. 8d. each, for average loss of life annually	772,730 9 64
Farriery and other incidental expenses, £1 pr head	811,385 0 0

Total, £27,648,539 4 8

We might add to this also the horses kept by small farmers, calculated to amount to 38,010, the annual approximating expenditure upon which would make the grand total equal to £33,000,000; which sum, at the least, would be saved to the growers by the cheaper mode of agriculture which the substitution of inanimate for animate power will effect.

This, perhaps, is greatly undervalued. Mr. Dupin, founder of the Mechanic Institute of France, in a comparative estimate of the amount of animate and inanimate force, applied to agriculture, in France and Great Britain, states the latter as follows:

Human race, 5,000,000, equivalent to 2,132,446 effective laborers.

Horses of full growth 1,250,000, equivalent to 8,750,000.

Whilst an authority of the highest consideration at home makes the brute labor employed in our husbandry to be ten times more than the human. In either case, allowing that a horse will do the work of six men, the suppression of brute force will, upon an approximating calculation, save nearly two-thirds of the annual expense of raising the food of the country.

The Farmer's Register. Edmund Ruffin, Editor and Proprietor. Richmond, 1833.

This is a monthly periodical of sixty-four closely printed large octavo pages, at five dollars per annum—principally devoted to southern agriculture, but more especially to that of Virginia.

The relative wealth and influence of the 'old dominion' have not been sustained, owing to the improvements in agriculture in the more Eastern States, to the virgin fertility of the Western, and to the internal improvements and prosperity of manufactures in all these States. Besides these causes of comparative decline, there has been an actual diminution of resources, arising principally from an exhausting system of cultivating the soil. We could scarcely believe that a section of our country so distinguished for intelligent and eminent men, could have pursued a course of cropping so wretched—founded on no higher philosophy than that it was the custom of forefathers. Field after field was cleared and kept under the plough without a single ameliorating crop, until from three to ten bushels of wheat were considered, on many estates, a crop equal to expectation. The exhausted condition of the soil compelled thousands to bid farewell to their native fields

* The kilogramme is 2 lbs. 3 oz. 5 drachms and 28 grains over. It is usual in speaking of 100 kilogrammes, to estimate them at 223 lbs.; or, in reference to approximate numbers, to consider the 100 kilogrammes as 2 cwt. English.

and vales, and seek those in the far West that were under the culture of nature. Thus farm after farm was left to be overgrown with weeds, and to serve as monuments of a deficiency in agricultural science. In this state of general depression of landed property, Mr. Ruffin steps forth and calls the attention of Virginians to calcareous manures. This is succeeded by the publication of his *Farmers' Register*—the old dominion begins to awake—Innumerable localities and inexhaustible quantities of marl are discovered east of the mountains—and now thousands are on the march of improvement. This ancient and renowned State is destined once more to rise in its strength and vigor. If Mr. R. continues to persevere and prosper, he will, in less than twenty years, be acknowledged as one of Virginia's greatest benefactors.

We shall proceed to make a few abridged notices and extracts, that will give our readers an idea of the work.

CLOVER AND THE FOUR-SHIFT SYSTEM.—The following may serve as one of the many excellent examples that the *Register* is bringing to the light of open day.

In the year 1816, Mr. James M. Selden took charge of Woods' farm, of 250 acres of arable land, the remaining 300 acres being all swamp land, subject to the inundation of the tides. Previous to his taking charge of the estate, it had been managed by overseers for a great number of years, under this disastrous system of three fields. To those who are acquainted with the character of the soil in the neck, it would be superfluous to say much. I shall therefore only state, that it possesses all the qualities of our best loam lands, only perhaps to a greater degree than any other within my knowledge: and probably would bear this harsh and bad treatment to a greater extent than most other soils. Under this three-field rotation, the crops on this estate were never more than 3 or 400 bushels of wheat, and from 100 to 120 barrels of corn. He at once saw that to persevere in this system of cultivation was to work for nothing, and finally to be left in utter poverty, so he resolved on a change to the four-field and fallow system. The crops, after the adoption of this change, were in every rotation increased to double, and in a very few years to five or six times the quantity.

THE WEEVIL.—There is a long communication in the November number on this subject. The preventive found most successful was to thrash the wheat early, and to spread it where it may not heat so much as to hatch the insect.

ORNAMENTAL TREES.—Of this class, deciduous trees are preferable to evergreens—because they preserve our dwellings from the solar heat in summer, but admit it in winter, when it adds to our comfort. The variety caused by the change of the seasons in the foliage of trees, from the first budding to the fall of the brown and golden leaves of autumn, also serves to relieve the mind from the dull uniformity or the cone-bearing and resinous ever greens.

TO SAVE THE SHOULDERS OF HORSES FROM BEING CHAFED BY THE COLLAR.—Some of the gentlemen of South Carolina are in the habit of making long journeys by land in their own conveyances, and are obliged to resort to every method of affording relief to their horses. From one of these I derived the following simple expedient for preventing the shoulders of harness horses from being chafed by the collar. The shrewd practical sense of the gentleman referred to is a strong guarantee of the value of his suggestions. A short trial of my own has fully convinced me of the utility of what is classically denominated the sweater.

This simple and effectual contrivance is made of two pieces of leather, which, for an ordinary horse, may be about 5½ inches wide at the top, 6 at the bottom, and 9 at the greatest protuberance, the front edge being straight, the posterior curved with a gradual swell adapted to the shape of the collar behind. These pieces must be sewed together at the bottom, and connected at top by two small straps and buckles, so as to be let out or taken up at will. The lower part must be so shaped as to fit the throat of the horse. A strap passes from the bottom of the sweater between the legs to the girth, by means of which it is kept in place. The strap should not be too tight, lest it might incline a balking horse to stop, when ascending a hill; and the buckle at the end near the girth, if it chafe, may be covered. The leather should be tolerably stout upper, rendered pliant by the occasional application of tallow to the outside. The inner side should be kept clean and smooth.

The sweater is in fact a sheath for the shoulders, and the collar rests on it instead of the skin of the animal. H.

Waynesborough, Va. Oct. 4th, 1833.

PREPARATION OF SEED WHEAT.—When I am about to commence seeding, I have two barrels prepared, one of which I have filled about two-thirds full with brine, strong enough to bear an egg, into which I have the seed poured very slowly, until the brine rises nearly to the top, which will be covered with the light grains of wheat, cheat and garlic, which are skimmed off with the hands, and the wheat at the bottom stirred once or twice to free it from any remaining impurities, which are again skimmed off. An old basket without a handle is then placed on the top of the empty barrel, through which the brine is poured from the wheat by two men taking the full barrel by its bottom on opposite sides. The wheat is then emptied into a large box, and the same process repeated from one barrel to the other alternately, until a sufficient quantity is washed for the day's seeding, and as much gypsum is then stirred into the whole mass as will adhere to the grain. Water is added occasionally, and a sufficiency of salt to maintain the strength of the brine, which is tested by an egg kept at hand for the purpose. The whole process is completed in the morning, by the time the teams are ready to proceed to their work. I suppose a bushel of salt would probably suffice for one hundred bushels of seed, which would, by reason of its invigorating qualities, be very well bestowed in that way, independently of its aid in freeing the wheat from its impurities.

F. H.

N. B. If the wheat is infected with smut, it will be effectually destroyed, by stirring in a portion of quick-lime before the gypsum.

BUCKWHEAT.—In a translation of an article from Rozier's *Cours Complet*, we make the following extract:

Besides the common buckwheat of which we have spoken, there is a species considered preferable, which is known by the name of buckwheat of *Tartary*, or of *Siberia*, and which was in 1782 much extolled by M. Martin. This variety, which has been brought from Siberia by a missionary of Low Maine, is especially suitable to the north of France: it is more hardy than the common kind; it is less inclined to lodge, and produces more. The grain is smaller, the stalk more yellow, and more solid. According to M. Curant, who calls this grain *Martin-Corn*, (in honor of M. Martin, of whom we have spoken,) the Siberian buckwheat fears neither hot winds nor white frosts; it gives for one seed sown, nearly two thousand in rich soils—and elsewhere, from fifty to three hundred and more; it makes a better meal, and can be kept as well and as long as that from wheat. These incontestable advantages are accompanied by some inconveniences: in the first place, the Siberian buckwheat shatters in reaping still more easily than the common, and consequently demands an increase of precau-

tions; then it grinds almost as slowly as rye, and it ought not to be sowed until July, a time when the hay harvest draws so heavily on the labor of the farmer.

MAGNESIAN MARL.—Among the numerous beds of Marl, a correspondent of the *Register* gives an account of one which Mr. Ruffin found to contain 50 per cent. of carbonate of lime, and 31 of carbonate of magnesia. Magnesia in lime is considered by many as injurious to vegetation. Mr. R. has collected much, both *pro* and *con*. When used in moderate quantities, the testimony appears to be in its favor. On richer soils it will be used in greater quantities. Sir H. Davy explains this on the fact that magnesia has much less affinity for carbonic acid than lime has; and, consequently, as long as any caustic lime remains, the magnesia will not combine with carbonic acid, and thus remain, caustic, and poisonous or hurtful to plants. For a rich soil more carbonic acid gas is disengaged, and unites with it.

EASY METHOD OF SOWING GRASS SEEDS.—I had a piece of sheet iron about four feet long and twenty inches wide, punched with small holes at distances of about half an inch or three quarters each way, and then made into a cylinder similar to a stove pipe. An axle passes through the cylinder, on each end of which is attached a wooden wheel of double the diameter of the cylinder, and on each end of the axle-tree are fixed the handles or frame, by which the machine can either be pulled after, or rolled before the seedman, as he may prefer. A cylinder four feet long and six inches diameter will hold rather more than a half bushel of seed, and will sow about a bushel to the acre.* Here let me observe that the seed should be very nicely sifted—for if there be much filth or chaff left in the seed, they will not be sowed thick enough. The seed may be put into the cylinder either by taking off one wheel or by having a door cut in the cylinder, after the manner of the barrel churn.

Since using this grass sower, (if I may so call it,) I find the grass is sowed more regularly—that much time and labor is saved, and it is almost impossible for the wind to affect the seed at all, since they are nearly touching the ground by the time they are out of the box.

* The holes should be about the size of those commonly punched in tin for safes.

SALT A MANURE FOR COTTON.—Alexander Jones, M. D., recommends, in the *American Farmer*, the use of salt as a manure to improve the staple of cotton. He says, if sea island cotton be planted for several years in succession in the interior of the country, it degenerates into the short staple cotton. In support of the benefit from salt, it is said that cotton in the vicinity of salt springs and licks is of a larger staple.

INDIAN MEAL BREAD.—Take as much corn meal as is wanting for use, sift it through a hair sifter, put it in an iron pot, and pour on it boiling water; stir it with a spatula or ladle till it becomes well mixed and quite thin; this being night, let it remain in the same vessel till morning, and if kept warm it will be well fermented, (which is necessary.) Then put it in what is called a Dutch oven, it being hot before the dough is put in it; apply good live coals on the lid of the oven and under it, being careful not to burn the bread. When thus prepared, if done carefully and according to this recipe, more wholesome and better bread cannot be used for breakfast. I think it an anti-dyspeptic, as no lard or butter is used in preparing the bread, though after it is cooked, good fresh butter adds to its flavor.—[*American Farmer*.]

Manufacture of Silk—Reeling, Twisting from the Cocoon—Description and Drawing of Brooks' Silk Machine. [From the New-York Farmer.]

The manufacture of silk is so likely to become an important branch of national industry, that we deem it important to lay before our readers all the information that we can obtain.

On the present occasion, we shall simply state the particulars of an experiment with Mr. Adam Brooks' machine.

REFERENCES.—A, the handle of the crank, giving motion to the machine. There is a band around the large wheel, passing around a small wheel attached to the axis of the cylinder or drum. B, the drum or cylinder, around which the bands giving motion to the spindles pass. C, the furnace for heating to blood heat the water in the pan D, containing the cocoons. E, the rollers regulating the supply of thread given to the spindles. F, the two spindles for twisting the single threads. G, the spindle for the double twisting or sewing silk. H, the two upright pillars supporting the bobbins containing the single thread to be double twisted. J, a projecting slat, containing the leading wires to receive the threads from the cocoons in the pan D.

After considerable inquiry for cocoons in this section of the country, we were enabled to obtain a bushel that had been, two years ago, sent on to this city, from one of the Southern States, for a market. In consequence of there being no demand for them, they had been put aside as a worthless article. They were in a box rendered tight by paper pasted over the openings at the joinings of the boards. Some of the cocoons were perforated by an insect not unlike the common moth; but generally they were in excellent order.

All the practical information we had had, was from seeing Mr. Brooks exhibit his machine in operation a few times. In connection with another person, whose opportunities of practical knowledge were no greater than our own, we took a peck of the cocoons, 135 in number, and weighing ten ounces. Without assorting them, as we should have done, we put a handful of some 20 or 40 into water about boiling hot—took a small broom and pressed them into

the water—found the floss silk adhering to the broom—gathered the silk from the broom, and kept drawing the silk until a fibre ran off singly and evenly from each cocoon—lifted these running cocoons from the water with an instrument not half so convenient as a skimmer, and placed them in a winding basin partly filled with heated water—served other cocoons in the same manner until we acquired two threads of about 100 fibres or cocoons, and carried the threads through the guide wires, between the rollers, to the bobbins. Thus prepared, we began to wind by turning the wheel, keeping up the thickness of the thread by supplying additional cocoons, and collecting and attaching the ends of those that had broken. After a sufficient quantity was on the bobbins, took them and placed them in the upright posts, and carried the ends through the guides and rollers to the bobbin, for the purpose of doubling and twisting. Replacing the bobbins with two more, we then, by turning the wheel, wound, doubled, and twisted the silk at one operation. Thus continuing, we obtained from the peck 14 ounces of fine sewing silk, which, when deprived of the gum, by being several times boiled in soap suds, weighed one ounce. Besides this, there were 4½ ounces of floss silk obtained from the gathering of the silk from the broom, from cocoons that would not wind, and from those that had been injured by insects, or imperfectly formed. These 4½ ounces, after having been cleansed in soap suds, weighed 3 ounces. This floss silk is to be carded and spun for stockings and other purposes.

The sewing silk being very fine, did not, owing to the improper adjustment of the machine, give a sufficient twist; in other respects it was pronounced a fair, saleable article. When it is considered that we were entirely green at the business, were several times obliged, as soon as we got into operation, to omit our labors for another day, and were not in possession of the conveniences for producing a good article, our readers will perceive that the manufacture of silk for common domestic purposes is not more difficult than to spin flax or wool, which was formerly done by the females of almost every farmer's family in the country.

Our lowest estimate of the value of the bushel

when made into sewing and floss silk, is \$4.50. Our information, however, relative to its price, is derived from books and personal inquiries, and is extremely varied, and often contradictory. One thing is very certain, that if \$2.50 to \$3.50 per bushel for the cocoons is a remunerating price to the farmer, the manufacture of them into silk in his own family must be very profitable.

The machine, the drawing of which accompanies this article, is the invention of Mr. Adam Brooks, of Scituate, Mass. It is admirably adapted for families, when sewing silk is intended to be made. The one we used is a beautiful machine, made of mahogany, in a substantial and workmanlike manner. It cost \$28. Those of hard but less costly wood, and thoroughly made, are \$25. With an additional bobbin, \$30 and \$26.

Machines made by the inventor may be had of the agents, H. Huxley and Co. 81 Barclay street.

RELATIVE CLAIMS OF AGRICULTURE.—Mr. Whitaker's views correspond so well with our own that we cannot refrain from giving another extract.

"But agriculture," says he, "contributes liberally to the constant demands, and not to the occasional wants of society—to the indispensable and never varying necessities of mankind at large, and not simply to the incidental and extraordinary calls of individuals. In this point of view, therefore, Agriculture prefers claims to a far higher consideration than either Law or Medicine. And if the question were put, which is best calculated to enlarge and liberalize the mind, the decision, I imagine, must again be in favor of Agriculture—of Agriculture, however, not degraded to a despicable rank, but raised to that high elevation where good sense and a just philosophy would place it. Even its humblest duties, I maintain, are performed under circumstances favorable to the development of a refined enthusiasm:

—Ask the swain

Who journeys homeward from a summer day's
Long labor, why, forgetful of his toils,
And due repose, he lingers to behold
The sunshine—gleaming as through amber clouds
O'er all the Western sky; full soon I ween,
His rude expressions and untutored airs,
Beyond the power of language, will unfold
The form of beauty smiling at his heart.
How lovely! how commanding!"

NEW-YORK AMERICAN.

JANUARY 25—FEBRUARY 1, 1834.

HOME INTELLIGENCE.

NAVY APPROPRIATION BILL.—We publish this as a bill of general interest and which has become a law.

AN ACT making appropriations for the naval service for the year one thousand eight hundred and thirty-four.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled, That the following sums be appropriated for the naval service for the year one thousand eight hundred and thirty-four in addition to the unexpended balances of former appropriations for similar objects, viz.

For pay and subsistence of the officers of the navy and pay of seamen, one million four hundred and eighty-seven thousand two hundred and forty-four dollars and twenty-one cents.

For pay of superintendents, naval constructors, and all the civil establishments at the several yards, sixty-one thousand one hundred and eighty dollars.

For provisions, four hundred and fifty thousand dollars.

For the repairs of vessels in ordinary, and the repairs and wear and tear of vessels in commission, five hundred and ninety thousand dollars.

For medicines and surgical instruments, hospital stores, and other expenses on account of the sick, forty thousand dollars.

For the improvement and necessary repairs of the navy yard at Portsmouth, New Hampshire, forty thousand seven hundred dollars.

For the improvement and necessary repairs of the navy yard at Charlestown, Massachusetts, eighty-six thousand three hundred dollars.

For the improvement and necessary repairs of the navy yard at Brooklyn, New York, fifty-seven thousand five hundred dollars.

For the improvement and necessary repairs of the navy yard at Philadelphia, six thousand five hundred and fifty dollars.

For the improvement and necessary repairs of the navy yard at Washington, twenty-nine thousand five hundred dollars.

For the improvement and necessary repairs of the navy yard at Newport, Virginia, one hundred and eight thousand two hundred and fifty dollars.

For the improvement and necessary repairs of the navy yard at Pensacola, twenty-six thousand dollars.

For ordnance and ordnance stores, ten thousand dollars.

For defraying the expenses that may accrue for the following purposes, viz:

For freight and transportation of materials and stores of every description; for wharfage and dockage, storage and rent, travelling expenses of officers, and fuel and candles, to officers other than those attached to navy yards and stations, and for officers in sick quarters where there is no hospital, and for funeral expenses; for commissions, clerk hire and office rent, stationary and fuel, to navy agents; for premiums and incidental expenses of recruiting; for apprehending deserters; for compensation to judge advocates; for per diem allowances to persons attending courts martial and courts of inquiry, and to officers engaged in extra service beyond the limits of their stations; for printing and stationary of every description, and for books, maps, charts and mathematical and nautical instruments, chronometers, models and drawings; for purchase and repair of fire and steam engines, and for machinery; for purchase and maintenance of oxen and horses, and for carts, timber wheels, and workmen's tools of every description; for postage of letters on public service; for pilotage and towing ships of war, for cabin furniture of vessels in commission, and for furniture of officers' houses at navy yards; for taxes on navy yards and public property; for assistance rendered to vessels in distress; for incidental labor at navy yards, not applicable to any other appropriation; for coal and other fuel for forges, foundries, and steam engines; for candles, oil, and fuel, for vessels in commission and in ordinary; for repairs of magazines and powder houses; for preparing moulds for ships to be built, and for no other purpose whatsoever, two hundred and ninety five thousand dollars.

For contingent expenses for objects not hereinbefore enumerated, four thousand dollars.

For pay of the officers, non commissioned officers, musicians and privates, and for subsistence of the officers of the marine corps, including arrearages and increased pay under the act, second of March one thousand eight hundred and thirty-three, one hundred and thirty-five thousand eight hundred and eighty dollars, and twenty-five cents.

For subsistence of non commissioned officers, musicians and privates, and washerwomen of said corps, serving on shore, nineteen thousand two hundred and thirty-one dollars and eighty cents.

For clothing, twenty-nine thousand three hundred and fifteen dollars.

For fuel, nine thousand and ninety-eight dollars.

For contingent expenses, including arrearages, nineteen thousand dollars.

For transportation and recruiting, five thousand dollars.

For medicines, hospital stores, and surgical instruments, for officers and men serving on shore, two thousand three hundred and sixty-nine dollars and seventy-one cents.

For balance due Lieutenant Colonel Anderson, nine hundred and fifty-four dollars and twenty-two cents.

For the erection of barracks for the marines stationed at the Navy Yard, Brooklyn, New York, thirty thousand dollars.

For carrying into effect the acts for the suppression of the slave trade, including the support in the United States, and for a term not exceeding six months after their arrival in Africa, of all persons removed from the United States under the said acts, five thousand dollars.

That so much of the sums appropriated by the act of the twenty-eighth May, eighteen hundred and thirty, for the relief of Alexander Claxton, as still remains due and unpaid, and which has been carried to the credit of the surplus fund, shall be, and the same is hereby, reappropriated.

DESTRUCTIVE FIRE AT HERKIMER.—The Herkimer county Court House and Jail, together with the Rev. Mr. Spinners' Church, in the village of Herkimer, were entirely consumed by fire on Sunday night. The fire took place in the prisoners' room by accident, but was not discovered in season to arrest its progress.—[Albany Daily Advertiser.]

DESTRUCTIVE FRESHET.
Extract of a letter from a gentleman residing in Charleston, Kanawha county, to his friend in this city, dated January 15th, 1834.

"I wrote the above several days ago—but owing to an unusual freshet in the Kanawha River, the mail did not leave our office. On Saturday, the 11th instant, it commenced raining, which continued until Sunday night, and our whole country was inundated with water. The Kanawha was within four feet of the rise of 1822, which was the greatest freshet ever known in the river. Many of the bridges are swept away, and all have sustained damages. I understand that the water was four feet deep on the floor of the Coal River Bridge, but it is said did not move it. The new bridge at Campbell's Creek was taken up the creek (by back water.) I have understood that they have been attempting to tow it back, and let it settle down, as the water falls, in its original place, and that they have hopes of succeeding. The embankment has also been injured. You will know where the water was in Charleston, when I tell you it was 18 inches deep on the floor of the dining room of Captain Wilson's tavern.

"Two negroes went into Mr. L. Ruffner's coal bank. The entry is somewhat lower than the interior, where they worked. The water rose over the mouth of the bank, before they were aware of its approach. They attempted to escape, but found that the long entry, of more than one hundred yards, was closed, and the water still advancing on them: They returned to their room, and got on a pile of slate in the highest part thereof, and in more than mid-night darkness, awaited the sure approach of death. In this situation they remained *two days and nights*. As soon as the water fell enough to let a *crust* enter the bank, one was sent in, but it could not pass the lowest point. The steersman called to them; they answered, and were requested to be patient—"the river was falling." What pen could describe the feelings of these poor fellows, when they first heard the sound of human voices! It is supposed, that the air, which was confined in the room by the mouth's closing first, prevented the water from filling it. But it is not certain that is the fact; or that the room, in which they were, was not above the water level.

"A considerable quantity of salt has been lost. Mr. B. sat and watched the approach of the water to within three or four inches of his salt-house, in which he had 30,000 bushels, that he could not remove. But the Dove returned with the Olive Branch. The waters began to recede."—[Rich. Enq.]

La Normandie is the name of a new packet ship of the Havre line, which is now preparing to sail on Saturday next, 1st proximo. This vessel was built during the past summer, at Hartford, in Connecticut, under the superintendence of Mr. Isaac Bell. She is between 5 and 600 tons, of fine model for both speed and burden, and of great strength. Her main cabin is on deck, and it is finished with remarkably good taste. The whole is painted white, very highly varnished, with a light gilt moulding around the panneling. The state rooms are large and commodiously arranged; and from the after part of the cabin designed for ladies, a private stairway descends into another smaller cabin between decks, admirably adapted to one or two families that might desire to be together on the voyage. One of the most striking novelties in this ship is the arrangement for the helmsman. The wheels are sunk in the quarter deck, constituting the roof of the main cabin, so that by throwing up a leathern covering, in the shape of a gig top, the man at the wheel is completely protected from the weather. His position too is behind, instead of beside, his wheel, as is generally the case, and hence he has more control over it. Upon the whole, it is difficult to conceive of more, or more ingenious arrangements for comfort—if such a term can be predicated of anything belonging to the sea—and safety, than is to be found in *la Normandie*—and so God speed her!

Great Sale.—The Company owning the "Old Line" of Liverpool packets, have sold six of the ships to a new Company, the Agent for whom are Messrs. Goodhue & Co. The ships sold are the Britannia, Caledonia, North America, South America, Europe, and Hibernia. The price is \$36,000 each. They are comparatively new. The Pacific and New York, the oldest of the fleet, are not included in the sale. The Agents on the other side are Baring, Brothers & Co. That great house, we understand, are making arrangements to extend their business in this country, where they say—they have made more money and lost less in comparison with the whole amount, than in any other country.—[Jour. of Com.]

The old line of Liverpool packets, we are desired to say, will be completed by the addition of the Orpheus and the new ship Columbus, now building, by Messrs. Webb & Allen, under the direction of Captain Cobb. These ships will take the place of the Pacific and New York.

The arrangement of the Line, which will take effect on the 1st of March, will be announced by the middle of next month.

The annual report of the Inspector of Pot and Pearl Ashes for the city and county of New York, was made to the Senate on Friday. Whole number of pounds inspected, including scrapings, 18,692,945; estimated value, \$823,383 31; inspector's fees, deducting expenses, \$4,304 85. The inspector adds that he does not know of any legislative provisions that would have a tendency to improve the quality or increase the quantity.—[Alb. Argus.]

APPOINTMENTS—Saturday, Jan. 18.
New York—Isaac Sayrs, measurer of grain, in place of Aaron Howell, resigned; D. C. Colden, notary public, in place of Thomas Shankland, resigned; Jesup Jermon, notary public, in place of Evert A. Banker, resigned; Theodore Allen, commissioner of deeds, in place of John L. Creger, deceased; Thomas Frost, measurer of grain, in place of Wm. Frost, resigned; Henry H. Orrington, public notary, in place of Wm. Orrington, resigned; Edward M. Luther, culler of staves and heading, in place of James Ravene, removed; Daniel Deitrick, inspector of sole leather, in place of Henry Leek, resigned; Edward Hueston, for pilot by way of Hell Gate, in place of Samuel Leacycraft, removed; John H. Bell, notary public, in place of Thomas M'Cready, jr. deceased; Richard W. Blatchford, a commissioner of deeds, in place of Mitchell Sanford, resigned; Jas. Rogers, measurer of grain, in place of Samuel Bleecker, removed.—[Albany Argus.]

[From the Baltimore American of Saturday.]
DESTRUCTION OF THE WARREN FACTORY.—A little before 12 o'clock on Thursday night the extensive Cotton Mill belonging to the Warren Manufacturing Company, about 15 miles from the city, was discovered to be on fire. The flames first appeared in the highest story of the building, near the belfry, about twenty minutes after the watchman had taken his regular half-hourly round through the rooms. He immediately attempted to give the alarm to the workmen by ringing the bell, but the second pull of the rope caused it to sever at the place where the fire had already reached it. This circumstance created some little delay in rousing the workmen, but they were nevertheless at the premises in a comparatively short time, and using every possible exertion to check the fire, but without, we regret to add, being able to accomplish it. In a short time the whole building, with all its valuable machinery, was reduced to a heap of ruins. None of the adjoining buildings were injured.

The cause of the fire cannot be traced. It broke out in a garret room containing nothing combustible, and but little used, and the watch-clock indicated the regular half-hourly presence of the watchman until the alarm was given. The fire was discovered at an early stage, but the combustible nature of the building, rendered still more so by the quantity of oil used on the machinery, baffled all efforts to subdue it. By far the most distressing circumstance connected with the event, is the fact that between seven and eight hundred persons derived, directly or indirectly, their support from this establishment, and are thus suddenly deprived of employment at this very inclement season.

We understand that the building and machinery were insured to the amount of sixty-three thousand dollars in several offices in the Eastern States. The property destroyed, however, could not be replaced for \$100,000.

LITERARY NOTICES.

No. XII.

MONROE Co. (M. T.) DEC. 5, 1833.

I write to you from a log cabin on the banks of the river Raisin, about 30 miles above Monroe. The worthy farmer, upon whose premises I am quartered for the night, sits with his child on his knee, in the chimney corner, with a prosing visitor, pipe in mouth, opposite, while the good woman is engaged doing some "chores" at the further end of the apartment, which is of course the chief cooking, eating, sitting, sleeping and smoking chamber in the house. My dormitory, I have a shrewd suspicion, is to be in a loft, from which a lad is at this moment descending by a ladder with some corn for my horse. The black walnut stand, upon which I am writing, occupies the centre of the room; and as I am at this moment keeping up my share in a desultory sort of conversation going forward around me, and at the same time trying to check the undue familiarity of a large bull-dog—who, like other individuals, has become troublesome from being admitted too rapidly into my intimacy—you must not expect me to be very coherent in detailing the impressions of the day.

It was a gloomy, lowering morning, with occasional flakes of snow driving through the harsh atmosphere, when I started from the village of Monroe, well mounted on a stout roan, whose figure and action would command thrice the sum in New York that the animal cost me here, and whose performance to-day speaks well of the dependence I may place upon him to carry me through my arduous route into the interior of the Peninsula. It was with a feeling of almost boyish pleasure that, after the slight taste I have had of stage travelling from Pittsburgh to Cleveland, and from Detroit to Monroe, I found myself once more in the saddle, with the full privilege of regulating my motions as I choose. The delightful mode in which I travelled with S—from New York to Wheeling, in a barouche, with two led horses under the saddle, was indeed, both for pleasure and solid comfort, not to be surpassed. But now, though I have neither the agreeable friend, the attentive groom, nor the luxurious carriage, to enhance the gratification and relieve the weariness of travelling, the feeling of independence still remains. And though I confess I could not suppress a sigh this morning, when packing up the linen and books which, with my trunk, I shall not see for a month to come, yet that pair of saddlebags beneath my feet, though conscious only of a shirt apiece, flanked as they are by my light fowling-piece, which that weather-beaten worthy is at this moment curiously examining, and my leggings, which are drying upon those andirons, make me feel as rich as did that famous soldado Dugald Dalgetty himself, with his single change of chamois leather and iron overcoat, while handling his arms and surveying his compact appointments from the back of the doughty Gustavus.

My road led, from the moment of leaving the village, along the banks of the Raisin, whose serpentine current flowed fuller and clearer the further I advanced into the country. The land at the same time gradually rising, and though never hilly, yet leaving the stream, far enough below to form a bluff of some 10 or 15 feet, where the timber land rose from the rich bottoms on its margin. After riding thus for about 20 miles along the river, where the log cabins gradually became fewer and farther between, I struck through a wood so dense that it seemed to terminate the settlements in this direction, and then at a sudden turning of the path, I came at once upon the "oak openings." It would be difficult to convey an idea of the pleasing effect of such a surprise. Imagine yourself emerging from a New Jersey swamp, and coming at once bound upon one of the English Parks which Puckler Muskaw so admirably describes. Clumps of the noblest oaks with not a twig of underwood, extending over

a gently undulating grassy surface, as far as the eye can reach; here clustered together in a grove of tall stems supporting one broad canopy of interlacing branches, and there rearing their gigantic trunks in solitary grandeur from the plain. The feeling of solitude I had while in the deep woods, deserted me the moment I came upon this beautiful scene, and I rode on for hours, unable without an effort to divest myself of the idea that I was in a cultivated country. Towards evening I found myself in the thick forest again, and was glad as the night closed in darkly over a road where at every step my horse would either sink to his knees in mud, or trip over the stubs of the newly cut saplings, to be overtaken by a mail-rider, with his leathern charge, on horseback. The lonely lad was as glad of company through the forest as I was of a guide; and he willingly taking the lead, I flung my bridle on my horse's neck, as the skies became blacker and blacker, and touching him smartly with the spur, away we went through the woods together. "Take care of that tree, sir; look out for the mud-hole!"—called my goblin usher at each moment, as we tramped and splashed along, where I would have defied the Evil One himself to have seen any thing but the impenetrable dark. I heeded him not; but bending low in the saddle to avoid the boughs, and glueing my knees to the surcingle, I surrendered myself to my destiny, and attended to nothing but keeping my horse as close to the heels of his file-leader as possible. At length we reached a clearing, and a few yards of better road brought us to a log-cabin. The family were at supper when I entered; and sitting down with the rest, I helped myself with an iron spoon from a dish of suppawn, and fishing up a cup from the bottom of a huge pan of milk, I poured the snowy liquid over the boiled meal that rivalled it in whiteness. The corn from which it is made, my host tells me, grew to the height of 16 feet, the stalks being of a blackish green color. From the same soil, a black sandy loam of easy tillage, wheat as high as a man's head has been raised; the produce from a single grain being from 300 to 400, and in one instance one thousand and twenty-six. I see symptoms of sleeping in those around me; and having no right to monopolize this important apartment, will conclude this elsewhere to-morrow.

TECUMSEH, LENAWEE Co., DEC. —

The cockloft, as I expected, was my place of rest. I stumbled over a pile of corn, and struck my head against the roof, almost as soon as I had got my body fairly above the trap-door. I found a clean bed, however, and it was a very sociable place, after all; for there were four persons besides myself stowed away in the different corners. So soundly did I sleep on my straw pallet, that the night seemed to me but just begun, when the red glare of a tallow candle flashing over my eyes, with the tap of the mail rider on my shoulder, told me that dawn was breaking, and that we must be gone. The landlord brought out a lantern for me to mount by, and we had proceeded far on our journey before the faintest streak in the East indicated the waking of the sun.

It was about 7 o'clock, when stopping to water at a little shantee, I found several laboring people at breakfast within; and the mail carrier consenting to wait for me, I sat down to table at once with the rest. The fare consisted of hot rolls and tea, with large pieces of pork swimming in its own gravy, with a plate of noble potatoes, that pulverized when you touched them. My plate was heaped at once with all, while each one present vied with the other in civility to me. They were talking of a horse, for which \$100 had been paid, when I entered; and an English poaching gun I have with me, not worth a fifth of the sum, caught the fancy of the owner. He insisted upon "swapping with me on equal terms," and seemed much hurt when I refused not only to "trade," but expressed no inclination to see

his favorite steed. I replied, however, so good-humoredly to his entreaties to trade, that he still persisted in them until taken aside by one or two of those present. He then came up to me in an altered manner—"I hope, sir, that I don't insult you by wanting to buy that curious gun, for I don't mean to be uncivil not at all in the least." Upon assuring him that I had taken no offence, he rejoined that if his horse was not worth \$300 he would eat him, but he had set his heart upon that gun and must have it. I did not like to expose myself to the temptation of seeing the horse though of course I did not think for a moment of taking advantage of the honest yeomans caprice, but had it not been a present from a friend abroad I should certainly have given my ardent acquaintance the toy which caught his fancy after what followed. "I say mister, said he musing for a moment "do you want a farm, eh! a house, eh! I'll trade you as good a tavern stand two miles from this as there is in this county." I got away at last as he followed me to the door and held my reins to mount, by promising to leave him the object of his desires in my will.

The character of the country continued for some miles much the same as that passed over yesterday, though the river gradually degenerated into a narrow muddy stream. The log cabins which always occurred in the heavily timbered district, had nothing to distinguish them from each other, and the openings were as silent as if man and beast had deserted them; though I saw a couple of deer in one instance feeding afar off and met a settler who was carrying a wolf, just caught in a trap by the road side, on his shoulders. I was struck too at seeing no less than three pet fawns near different houses, within a few miles of each other. In one instance a tall hound was sitting erect beside one of these gentle creatures, who was licking the ears of the enemy of his race. The incident reminded me of an anecdote I heard told by an old hunter in one of the wild districts of New York. His favorite hound one morning, when the deer were in the red coat and not fit to hunt, came to him while chopping, and made signs for his master to follow to a thicket not far off, where the woodman discovered a fawn so entangled that it could not escape. It was so small and feeble that he carried it away with ease in his arms, while the doe, which was near at hand, followed her bleating offspring. The dog accompanied him with great apparent joy, and, though one of the keenest of his kind, would drive off the grown deer only a few rods and then return at once to keep an eye on his master's movements. The fawn was taken home, and, being fed continually by the children, soon went tame about the house. The dog, however, insisted upon sleeping with it, and could scarcely be separated from his long eared friend, and when it met with the usual fate of pets and died prematurely, a month or two after, poor Ring was inconsolable. The worthy English settler, who had been a game-keeper in the "wild country," in his day, added, that he had the curiosity to dress a piece of the venison, which, fond as hounds are of that food, was rejected with disgust by the canine mourner.

One of the other fawns which I saw, would, with the group attendant, have made a pretty subject for Fisher's pencil. He had thrust his head into a bevy of rosy little girls, who were making "sand pies" on the bank of the river, and as his delicate hoofs threatened to demolish the rural substitutes for the card houses of parlor bred urchins, one of the little architects, covering her work with her hands, kept the intrusive animal at bay with her head; the long yellow locks of which streamed over his bluish crest while the perverse beast twisted his snout under and insisted upon licking her face.

It was still early in the afternoon when I arrived at this place, and my surprise was not slight after coming through a region where every mile seemed to lead me further from ci-

vivilization to light suddenly upon a pretty village laid out with broad streets, and having an excellent tavern on a public square in the centre. I entered the town through an oak opening. When a few hundred yards from the village, I passed a half dozen graves, apparently dug at random among the trees, though each was ornamented with a handsome head stone. I have since learnt that the towns people, with a degree of consideration which might well be emulated in larger cities, are already making arrangements to lay out and plant a public cemetery for the use of every religious denomination in the place. At Monroe I believe they have already done the same thing. There, indeed they had an ample number of guests for the narrow house, before even the abodes for the living were built. The bones of the butchered Kentuckians bleached till within a few years on the banks of the Raisin, and a gentleman of the place told me that he had often walked over the execution ground and handled skulls that were cloven with the tomahawk. There is also an Indian cemetery about 12 miles from Monroe, where the skeletons of the dead can be plainly seen through the crevices of the stone pile heaped above them. I am told that they are wholly unmolested by the white inhabitants; partly from feelings of decency, creditable to themselves, and partly, perhaps, from fear of the roving relatives of the deceased, who return yearly and observe the condition of the spot, with a jealous eye. Not far from this place, resides an old settler, who has killed a half a dozen Indians with his own hand. Three or four of them he shot with his rifle from his cabin, when they surrounded it to capture him; and the stories told of his encounters with the others, might better be detailed by a novelist than a letter writer. I have seen nothing of the natives yet, except a couple of Wyandott squaws, though the French settlers with their elf locks and blanket capotes, might at a distance be well taken for aborigines. I think a little of starting at once for the rapids of the Grand River, and spending a week or two among the Ottawas, who, I am told are still there in considerable numbers, and preserving enough of their original habits to make them fair specimens of the Michigan Indians. They tell me however that a guide will be indispensable, and having already offered one in vain a fair compensation, I may be compelled to give up the attempt.

The Grand river or Washtenoug is, as I have before mentioned, the largest stream in the Peninsula, being 270 miles in length, while the country watered by it consists of about 7,000 square miles. It has a good harbor at its mouth, on Lake Michigan, for vessels drawing 8 feet water, and it is navigable for those drawing 4 feet for more than 30 miles from the Lake: while further inland it traverses a country represented, by my informant who has recently returned from surveying in that distant region, as of immense fertility. There are also beds of gypsum and lime, with sound stone quarries and mines of iron and with indications of the existence of copper, to be found on its tributaries, while a hundred mineral springs—which seem to abound in this country, for I have already seen a half a dozen—enrich the central region where its branches interlock with the bright waters of the Huron on the eastern, and the myriad of streams and lakes which form the sources of the Kocklamazoo on the western, side of the Peninsula. They tell me here that it would be in vain for me to attempt to cross the country from Chicago to St. Louis alone at this season of the year, when, if the vast prairies are covered with snow, I should be lost beyond a certainty, and as I am now compelled to remain until the new mail contracted for commences running on the first of January, I shall employ the intermediate time in seeing as much of Michigan as possible. I find myself among the most intelligent population of the middle class (the bone and sinew of a community) I ever mixed with, and every one seems so contented, I may even say delighted, with his adopted home, that I am catching a little of the spirit of those around me, and am eager to visit more intimately scenes which one would suppose were Elysian, by the way in which people talk of them. I find myself as yet only 35 miles from Monroe by the new U. S. road, though the route I travelled was 65.—When you next hear from me I shall be father in the

interior, and hope to be able to tell you that I have seen a hill or a rock, the sight of either of which would, I confess, be refreshing in spite of all the charms of oak openings, vine hung streams, and grassy bottoms. H.

PETER PARLEY'S BOOK OF POETRY.

PETER PARLEY'S BOOK OF BIBLE STORIES. Boston: LILLY, WAIT & Co. Agent in New York, J. W. LILLY.—These are two little volumes, in the usual style of Peter Parley, adapted for children and youth, and adorned with wood-cuts. The Book of Poetry is composed chiefly of short and well selected pieces. The Bible Stories, is made up of two little English books, "Bible Letters" and "Gospel Stories," with some few alterations and omissions.

DENTOLOGIA, A POEM; by SOLYMAN BROWN, A. M. with Notes Practical, Illustrative, Historical, &c. By ELEAZAR PARMEY, Dentist. New York: PEABODY & Co.—A poem "on the diseases of the teeth, and their proper remedies!" Was ever Muse invoked in such behalf before? This may well seem a very natural exclamation, and yet, when one goes beyond the first blush of the subject, it will be found that inspiration is sought, and found, too, by the poet, in lovely woman's face, of which two rows of pearl form not the least lovely feature. In serious truth, Mr. Brown has here treated a subject, unpropitious certainly, with no common talent, while, in the notes of the friend to whom he dedicates his poem, there is much that may be read with both profit and pleasure, by the admirers of, and those admired among, the fair sex.

LIFE AND WRITINGS OF MAJOR JACK DOWNING, &c. written by himself: 2d edition, 1 vol. Boston, Lilly Wait, Colman & Holden.—This volume contains capital humor and satire; though much of it, from its local application, referring to quarrels in the Maine Legislature, will be less relished here than in New England. There are appended to it—and that, considering they are denounced as spurious, seems unfair—several letters of our Major Jack Downing. The whole of these—which, bearing on general affairs as they do, and revealing with such intimate knowledge, the doings of both cabinets at Washington, and of the interior of the General's palace, are universally acceptable—will, we are glad to hear, soon be published here.

MECHANICS' MAGAZINE, for January.—Among the diversified and truly interesting contents of this number, we remark a drawing and description of Dr. Church's Steam Carriage for ordinary roads, now in practical operation in England; and a clever paper on Mr. Burdon's steamboat. Mr. Verplanck's address, too, before the Mechanics' Institute, is given at length, and will, we hope, be generally read and meditated.

Accompanying this No. we have received a large and handsome 8vo. volume, comprising all the numbers of the past year. It is a volume which working men in all departments, and men having any turn for mechanical or scientific enquiries, should possess.

HEATH'S BOOK OF BEAUTY FOR 1834.—We have just seen this beautiful volume, which W. A. Colman has received by the George Washington. It is in all respects of engraving and printing, worthy of its name. He has also vol. 1. of "A Miscellany of Natural History," containing the history of Parrots, and giving all their varieties in colored engravings; a well executed work.

FOR SALE,

ATLANTIC JOURNAL AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Rafinesque, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. dedicated to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 100 plates, containing also the economical properties of 300 genera of American plants. \$3.

MANUAL OF AMERICAN VINES, and Art of Making Wine, with 42 figures. 25 cents.

FISHES AND SHELLS OF THE RIVER OHIO. 1 dollar.

AMERICAN FLORIST, with 36 figures—price 25 cts.

Orders for these works, or any other of Professor Rafinesque's, received at this office.

As of J M & F

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania. Hudson, Columbia county, New-York, January 22, 1833.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscribers, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 773 of this Journal.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1833.

In reply to thy Inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This Instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833. Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

A. H. GILL, Civil Engineer,

Germantown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY A. CAMPBELL, Eng. Philad., Germantown, and Norristown Railroad.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, FEBRUARY 8, 1834.

NEW-YORK AND ERIE RAILROAD.—This important public improvement seems to attract less attention at this moment of pressure and despondency, than it merits. The great question now seems to be how to pay old, rather than to contract new, liabilities; and so it should be: yet such a measure as that of opening a more direct, easy, and expeditious communication between this city and the great west, should not, for a moment, be lost sight of. Every preliminary measure for immediate action, when the sun of prosperity shall again arise, should be adopted, and every man who has an interest in the prosperity of either the country at large, that through which the road is to pass, or of this city, should be ready to aid in its accomplishment. We have often referred to this contemplated railroad, as a measure in which the state, as a state, ought to take an interest. It would be to the southern what the canals are to the northern part of the state; and by whom were those constructed? Were they not built by the state? If they were, why should the state hesitate to confer equal benefits on other parts of the state, where the public at large would be equally benefited? The people of the southern part of the state are equally entitled with those of the northern part, to public improvements, if those improvements will contribute equally to the general prosperity of the country; and therefore the legislature cannot, in justice, withhold the aid of the state from this important improvement.

[COMMUNICATED]

New-York, 1st Feb., 1834.

Hon. STEPHEN ALLEN,
Chairman Water Com. :

SIR,—By a note recently received from Mr. Ogden, one of the assistants on the water survey, I regret to learn that the arrangement of his name, second in order, in the roll of the party annexed to my report, is considered by him as reflecting invidiously upon his professional standing and character; and as nothing was further from my purpose than to make any reflection of that kind, I cheerfully accord to his wishes in submitting the following explanations.

Mr. Ogden and Mr. Cartwright were the heads of two co-ordinate branches of the service; the former having charge of the leveling operations, and the latter that of the traverse work: but as both performed their duties in immediate relation to myself, as the head of the party, they acted without any particular relations of responsibility or subordination with respect to each other.

In drawing up the roll referred to, the name of Mr. Cartwright was placed first, in consideration of his age and general respectability of character, without intending to imply, by any means, that he was the *official superior* of Mr. Ogden. In fact, the duties of the latter, according to the routine of the service, necessarily preceded those of the former, and in point of professional responsibility, were second only to those of the principal engineer.

Presuming that these explanations will remove any unfavorable impressions of the kind alluded to, I remain, very respectfully, your obedient servant,

D. B. DOUGLASS,
Chief Engineer on the late Water Survey.

Economy in the Use of Steam. [Communicated for the American Railroad Journal, and Advocate of Internal Improvements.]

It has been for several years past, to the writer, an important object, and a favorite study, to effect, if possible, a saving in the use of steam; and after a great variety of experiments on the subject, he has arrived at the conclusion, and believes he can demonstrate clearly to every rational mind, by actual experiment, a saving of nearly one-half, by the use of double cylinder engines. In order to illustrate the fact, he has fitted up a small model, so arranged as to give every possible chance to test fairly the correctness of his theory. The machine above mentioned is constantly in operation at Wm. T. James' foundry and steam engine factory,

No. 40 Eldridge street, where those interested in such matters are respectfully invited to call and satisfy themselves.

The following is the plan of Mr. E. JOHNSON for constructing railroads, referred to in our last. It is a plan upon which we should like to have the opinion of experienced engineers.

Mr. Johnson will also oblige us by communicating the probable expense of such a railroad in ordinary situations.

A New Plan for the Construction of the Wood Work of Railroads. By ELISHA JOHNSON. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

SIR,—Having introduced a new plan for the construction of the wood work of railroads, which is adopted by the directors of the Buffalo and Black Rock Railroad Company, I wish, through your valuable Journal, to give a brief description of the same, in answer to inquiries that have been made.

Place longitudinal sills, *a a*, of round timber one foot in diameter, hewed on one side, even with the surface of the grade; cover the road bed with plank, *b*, two and one-half inches in thickness, and seven feet long, resting upon the grade and sills; over the sills place two by four inch scantling, *c c*, on which are placed the iron plates: all of which parts are secured by eight-inch spikes, terminating in the sills.

The plan is proposed for new districts of country, where the location of the line of road is through low table lands, or the rich farming lands of secondary formation, which are retentive of moisture, or light sand soils; all of which would require expensive preparations of the grade by rubble or gravel blind drains, &c., to prepare for the reception of the timber work.

In the usual form of timber constructions, it has a superficial bearing of twenty-nine feet upon the grade, to the rod. In the above form, there is one hundred fifteen and one-half feet

of bearing per rod, increasing the strength of road in proportion to its bearing, on unprepared grades, and ample strength for locomotive power with heavy trains, on alluvial soils.

The expense of materials is about the same in either plan, where suitable timber for rails can be obtained in the vicinity of the line of road.

The improvement proposed consists in saving the expense of a prepared grade and horse path, varying in cost from one to two thousand dollars per mile; also, a saving of the item of suitable rails, when they have to be obtained at great expense of transportation, as well as the mechanical work connected with them.

The plan proposes other advantages, viz.: the admission of the use of such timber as is most convenient to obtain near the line of road; a material saving of expense in passing water-courses, bridges; and the construction of turnouts and crossings by a continuous floor, which forms a roof to the grade; when by use and the effect of rains, the joints of the timber are filled with earth, the water passing off through triangular apertures Δ , at the meeting at the ends of the supports to the iron; greater security from the effect of frost, by reason of the form of construction and a dry grade; the spike that secures the iron, secures the different parts of the timber work; a dry horse-path, which is proposed to be protected by the use of a thin coating of sand over the floor—this will protect the timber from the effects of the sun, and preserve a more uniform moisture, aiding the preservation of the timber.

In reference to objections that may be urged against proposed improvements, it is not practicable to answer them fully, except by the test of experiment. In the construction and use of such a form of road, it is suggested that it may be inconvenient to repair an imperfect embankment, which is remedied by the ease which the wood work may be taken up and put down again, or by having movable plank at every three or five feet, to be drawn out from between the spike or every other plank moveable, if screwed six inches in width.

The wear of the plank and the effect upon the horse at a speed of ten miles per hour, are proper questions of inquiry. In answer, the wear of the plank: by comparisons made without protection, as proposed, it is satisfactorily ascertained that the wear will be less than the decay for the amount of horse power required on railroads, if locomotive power is not used. The effect upon the horse is believed to be more favorable than upon a compact gravel road in dry weather or frozen earth, ice, or stony roads, if not relieved by the sand covering.

A question may arise, of comparative effect upon the decay of the timber. In the common form, parts of the work, such as the tenants of the cross timber or sleepers, are believed to be in the most exposed situation they can be placed; when in the proposed form, by a continuous bearing upon the grade, the timber can be used in an advanced state of decay.

The simple form of construction removes a prominent cause of expense in the details of the management of laborers and mechanics necessary in completing the several parts in the common form of construction: if connected with the contracts for grading, the sills are put into the grade as a part of the contract. Twelve days, with one superintendent, one mechanic, and six laborers, will complete a mile of road, with the materials delivered on the line, tested by experiments that have been

made; the time required is the time necessary to drive the spike.

In adopting the aforesaid principle of transferring the strength of rail to the sill, and obtaining strength of grade by increasing the superficial feet of bearing, will admit of many variations from the above described form, in the size, quality, and quantity of timber, in different descriptions of grade, and in the use of red cedar, with many other particulars not proposed to be entered upon in this communication.

The experiment that has been made in the completion of three-fourths of a mile on the Buffalo road, have been favorable in the results; and in the experiments of loaded cars on the track, a favorable effect was noticed by reason of the continued bearing and direct connection with the grade, particularly on a part of the grade that was loose clean sand, which, from its confined position, had the apparent effect of a stone foundation: the grade receiving all of the action of a moving heavy body.

If these remarks should contribute to useful inquiry, and an improvement made in the form of construction, adapted to the age and circumstances of our country, where capital bears a high rate of interest, and the present limited business of different sections not warranting expensive constructions, would be all that could be expected from these imperfect remarks.

ELISHA JOHNSON, Civil Engineer.

Rochester, Jan. 24, 1834.

Report of the Committee on the Affairs of the Saratoga and Schenectady Railroad. Presented 4th December, 1833.

[Continued from page 51.]

There being no farther occasion for an engineer of the Road, the services of the person heretofore filling that office have been dispensed with; a saving of the salary of \$1500 per annum is thereby effected. It is believed that, by establishing a carpenter's and blacksmith's shop at one of the stations of the line of road, and employing a skillful workman in each department, by the year, whose duty it shall be to attend to all the repairs of the Company's wagons, the laying of timbers on the Road, shoeing horses, &c., a great saving will result to the Company, and facilitate the operations of the Road. Heretofore the work has been done at different places, and the highest prices uniformly paid. The Committee are strongly impressed with the necessity of making such an arrangement, and thereby securing the advantages of having at all times the necessary hands to conduct the business of the Road.

The Committee, after having very carefully examined into the relative expense and advantages of steam and horse power, are fully convinced that the former is to be preferred, both as it regards economy and usefulness.

The engine now owned by the Company was constructed by Messrs. George Stephenson & Co., of Newcastle, England, and put in operation on the Road on the 2d July last. Its performance has given entire satisfaction. The Committee, viewing the importance of procuring another locomotive engine, and that any longer delay would be detrimental to the interests of the Company, have already ordered one from England, and availed themselves of the services of Mr. John Hampson, the Company's engineer of the locomotive, who embarked for Liverpool on the 1st instant, in order to examine the various improvements in this branch of business. He will suggest to the manufacturers some slight alterations from the one already in use; submitting it, however, to the better judgment of Messrs. S. & Co. to adopt such suggestion or not, as they may deem expedient.

The expediency of laying down turn-outs, each about 100 feet in length, was a subject to which the attention of the Committee was directed. From estimates made, it appears that a turn-out of 150 feet will cost about \$80, as the materials are already at hand. After a careful survey of the whole line of Road, the

Committee have come to the conclusion that it will be expedient, in addition to those already laid, to establish them at the following points, viz.

1st. At a distance of about 3 miles south of Saratoga Springs.

2d. Two miles south of Ballston Spa.

3d. At some convenient point between Schenectady and what is termed the "Half-way House."

Independent of the convenience those would afford to cars coming in opposite directions, they would also be found useful as stations for loading and unloading freight cars, either with materials for the use of the Road, or merchandise, wool, &c. to and from the adjacent neighborhood.

Although it is believed that the Company are furnished with sufficient horse and steam power to extend their freight business to the amount of exports and imports already mentioned in another part of the Report, yet as the present number of wagons can only conveniently transport from 10 to 12,000 tons, they would suggest the expediency of adding 12 more; making, in the aggregate, 30 wagons. As respects the passenger cars, it is believed that the present number will be sufficient, making due allowance for the anticipated increase of travel the next season.

The business of the Road has yielded, from the opening up to this date, as will be seen in the Appendix, the gross amount of \$42,666 79. The expenses in conducting its operations during the same period, have amounted to \$16,990 92; leaving a net profit of \$25,675 89: to which is to be added the sum of \$811 50 premium on the sale of stock made last April, making the sum of \$26,487 37. From this amount, the sum of \$14,250 was paid last September, being 5 per cent. on the capital, to stockholders, for the first regular dividend declared in August, leaving at this time a clear profit of \$12,237 37; to which may be added \$2,200, a moderate estimate for net proceeds for December and January: there will then be applicable for the next semi-annual dividend in February, the sum of \$14,437 37.

The Committee, taking into view the increase of business, and the ample means of the Company to carry into effect the arrangements recently completed for next season, and also the improvements in various branches of the administration of its affairs, together with the impulse given to the village of Saratoga, evinced by the erection of buildings for the farther accommodation of visitors, are of opinion that the gross income to be derived from passengers may be estimated, for the ensuing year, at \$50,000, and the freight at \$15,000; from which deduct, for ordinary expenses, \$6,000, and \$3,000 for repairs, together 19,000, will leave the net-proceeds of \$46,000.

In making this calculation, it is confidently believed the resources of the Company are not exaggerated; and a general calamity only, by which all public incorporations of this nature must suffer, can curtail the receipts. It may be farther remarked, that the past season was unpropitious, on account of the coolness of the summer; and the great number of visitors to the Springs is to be attributed mainly to the safety, facility, and expedition, afforded by the railroads.

It appears that the number of passengers that have travelled over the Road, since the opening of the same to the 30th November, 1833, amount to 53,018; but the Committee have not been able to ascertain the proportion that have passed to and from the several points on the Road, nor have they been able to distinguish the number that have gone for the purpose of visiting the Springs from the business travel.

As the Committee have adopted a system of collection, with regular checks from one point to another, they will be able hereafter to satisfy stockholders in this particular. They are, however, fully convinced, that the receipts for the business travel, with the receipts from

freight, will secure to stockholders, without calculating on the summer travel to the Springs, a fair income for their investment. Although public notices of the permanent operations of the Road were only given in the North and West late in October last, the increase of business travel has been great. By the comparative view taken in the Appendix F, the business carried on in October and November last year and this present year, in which months there is no pleasure travelling, it will be seen by the returns of October, last year, that \$839 96 were received; in the month of November, \$483 44 were received: and that in October of the present year \$1,574 89 were received; and in November, \$1,704 25. The present month of December promises yet better results. The Committee, therefore, in advancing their opinions of the future prospects of the Company, have founded their calculations upon positive data. This improved state of things may be ascribed, in a great degree, to the recent arrangements, and the regular system introduced for conducting the operations of the road, and proper publicity having been given to such arrangements.

The Committee, after examining the several statements exhibited by agents, for construction of the Road, have found that, according thereto, it appears that \$297,237 have been expended; and that a farther expenditure is required of \$11,820, making a total of \$309,057; from which is to be deducted \$6,541 27, for property the Company have on hand, at present useless, and which has been already paid for; leaving the sum of \$17,515 73 more than the present capital.

No part of this amount, which, in the opinion of your Committee, is required to place the Company in the attitude of carrying the general operations of the Road on the most extensive scale, and in the most successful manner, will be wanted until the ensuing spring and summer. To provide for this sum, whenever it becomes necessary, the Committee suggest two modes: one, the increase of capital to the extent already authorized and provided for by the charter: in this case, the Committee recommend to distribute the same among the stockholders, in the ratio of the stock they represent. The other mode is, to resort to a temporary loan. The latter mode, with deference to the opinion of the Board, is recommended by your Committee; as a loan for this small sum could be easily obtained on the most favorable terms, payable by instalments out of the abundant means of the Company.

In conclusion, the Committee would briefly remark, that during the progress of their investigation, they have acted under a sense of the importance of the duties devolved upon them. If they have succeeded in placing the affairs of the Company in their true light, and contributed in any degree to secure the interests of stockholders, they will feel a rich and ample reward.

JOHN B. LASALA, } of New York.
HENRY H. LAWRENCE, }
JOHN TOWNSEND, of Albany.

New-York, December 4th, 1823.

Total amount of moneys expended in the construction of the road, purchase of lands, locomotive engine, cars, waggons, horses, and all the various items of property belonging to the Company, appears by the abstracts furnished to the Committee to be . . . \$297,237 00

The amount of unsettled claims against the Company, (which are yet to be substantiated before they are paid,) is estimated not to exceed . . . \$2,000 00

Cost of an additional locomotive engine, . . . 5,500 00

Twelve additional waggons, to extend the transportation of merchandize, produce, &c. . . 3,000 00

Four turn-outs to be constructed on several points of the road, the materials being on hand, will not cost above \$80 each . . . 320 00

Two shops for blacksmith's and carpenter's work . . . 1,000 00

Capital . . . 309,057 00
285,000 00
24,057 00

The Company have the following property to dispose of, which is now useless, viz. mansion house and lot at Ballston Spa, taken to avoid paying heavy damages, which cost the Company \$3400 . . . 2,700 00

5,000 stone blocks, and 1,000 cubic yards rubble stone; estimated . . . 2,250 00

House and Furniture at the junction of Mohawk Railroad, which cost the Company \$1,250 . . . 750 00

Drawback to be received from U. States for Railroad iron . . . 344 88

Due to the Company for iron plates and Railroad iron . . . 246 39

A quantity of pine wood . . . 250 00

Amount that will be required above the present capital of \$285,000 to place the establishment on the footing recommended by the Committee, . . . \$17,515 73

ESTIMATE FOR KEEPING THE ROAD IN ORDER, PER ANNUM.

Six steady laborers, at \$25 per month, . . . \$1,800 00
Barrows, spades, picks, &c. . . 50 00
Two horses, with rubble wagon to convey stone, slate, earth, &c. . . 200 00
One man to drive wagon, . . . 300 00
Timber and iron to repair rails, . . . 650 00
\$3,000 00

Saratoga Springs, Oct. 29, 1833.

The subscriber, at the request of the Committee of the Saratoga and Schenectady Railroad Company, has examined the mason work on the whole line of Road. The following is the result of his observations:

The walls at Schenectady are in good condition, and may stand for several years, with the exception of about thirty feet, between the second and third street bridges, from Railroad office, which stands in need of some repairs, the cost of which will not exceed the sum of twenty-five dollars.

The culvert at Saunders's Flats, now rebuilding, can be completed in two or three weeks; from the plan on which it is now constructing, it will be a permanent and substantial work. The temporary support of the Road at that place will answer the Company for the transportation of passengers and freight, during the construction of the culvert, and longer if it were necessary.

The mason work at the Kayaderoseras bridge is executed in a good and substantial manner, and the bridge itself is well braced, and abundantly strong for all the purposes of the road.

All the other culverts and drains on the line of Road appear to have been well built, and are now in good order and condition.

All which is respectfully submitted,
JAMES VANDENBURGH.

Recapitulation.	
Number of Passengers that travelled on the Road from 12th July up to 31st December, 1832, . . .	10322
Do. do. from 1st January up to 30th November, 1833, . . .	42696
Total, . . .	53018
Amount received for passengers in 1832, from 12th July up to 31st December, . . .	\$7539 74
Do. do. in 1833, from 1st January up to 30th December, . . .	31208 13
Do. do. for freight, . . .	3043 92
Amount due to the Company, for freight previous to the 1st November, to be collected, . . .	250 00
Amount to be received from U. S., for carrying the mail in 1833, due 1st January next, . . .	525 00
Gains on the sales of Stock in April, 1833, . . .	811 50
	\$43478 29
Total expenditures for conducting the operations of the Road . . .	\$16990 02
Net profits, . . .	26487 37
Paid to the Stockholders in September, 1833, the first regular dividend, 5 per cent. on the capital, . . .	14250 00
Balance . . .	12237 37
Estimate of net profits (chiefly from freight) in December and January, . . .	2200 00
There will be on the 1st February,	

towards the second regular semi-annual dividend, - - - - - \$14437 37

Note.—By looking at the above dates, it will be perceived that the receipts of the Company for the months of July, August, September, October, November, and December, 1832, exceed the disbursements by \$2550 16, and that the receipts of the Road for the months of January, February, and March, of this present year, fell short of the disbursements for that period, by \$932 57, so that deducting this last amount from the profits on the 31st December, 1832, those profits are reduced at the end of March, 1833, to \$1617 59, or about half of one per cent. on the capital; so that all the profits of the Road, with the exception of this \$1617 59, have been made since 1st April, of the present year, 1833.

THE GENESEE AND ALLEGANY CANAL.

(Continued from page 53.)

To the Honorable Canal Commissioners of the State of New-York.

GENTLEMEN—

Agreeably to a request communicated to me by the Hon. William C. Bouck, I have examined three of the canal routes authorized to be surveyed by an act of the legislature of the winter of 1825, to wit: One from Portland, Chataque county, to the head of the Chataque lake; one from Lake Erie to Allegany river, through the valley of the Conawango; one from Scottsville, by the way of La Roy, to the upper falls of the Genesee river; and also a part of the route from Rochester to Allegany at Olean, through the valley of Genesee river. These I shall take up in the order in which they are mentioned.

1. Route from Portland to the head of Chataque lake. I arrived at Portland on the 20th of September. The harbor here is of considerable importance, as it is becoming a principal landing place, not only for the goods which are consumed in its immediate neighborhood, but also for much of the merchandise that is designed to go down the Allegany river. It is situated on lake Erie, in Chataque county, about sixty miles above Buffalo, and is formed on the west by a bar of sand and gravel, which extends into the lake about eighty rods, and upon which a pier and store house are already erected. From this point, the bar turns at an angle of about ninety degrees, and takes an easterly direction until it meets the shore, leaving a space or entrance of about one hundred feet in width, a short distance east of the angular point, as is represented in the subjoined map and plan.

A pier of proper height commenced at this opening and opposite the one on the west side and extending in an easterly direction along the bar seventy-two rods, thence turning at an angle of about eighty degrees and running to the shore, would make a very commodious and cheap harbor, giving an area of six hundred and sixty square rods of six and a half feet of water, and an area of two thousand seven hundred and seventy-two square rods of three and a half feet water. After a cursory examination of the country between Lake Erie and Chataque, I judged the route to be practicable, and commenced taking levels at the harbor, and proceeded to the last mentioned lake. The difference of elevation between the two is 723.9 feet, which is the amount of lockage on this route. The distance between the two points is about ten and a quarter miles, the first seven and a half of which are remarkably favorable; the surface of the ground is very smooth and regular, the soil an easy sandy loam, and the grubbing and clearing light. The remaining distance will be a deep and expensive cut through a ridge, rising in the distance of twenty-one chains to fifty-two feet above our level; thence gradually descending to the level again, in the distance of one hundred and ninety-nine chains, making an average cutting of twenty-six feet. The soil is a clayey loam, and there are no indications of rock even in the bottoms of deep wells; and as a further proof of this,

we found no rock in the ravine formed by the Little Chataque, which winds round the foot of this ridge, and which within two miles is at least two hundred feet below our level.

This route must be supplied with water from the Chataque lake, which I think will be adequate. I gauged its outlet on the 3d of October last, during a very severe drought, and it then furnished 2295 cubic feet of water in a minute.

Estimate of expenses.

7½ miles at \$4000, including contingencies,	\$30,000 00
2½ miles deep cutting, at \$114-322,	314,385 00
724 feet lockage, (timber locks,) at \$75 per foot,	54,300 00
	\$398,685 00

Second Route from Lake Erie to Allegany, through the Valley of the Conawango.

I commenced taking levels at the head of the first rapid on the Chataque* outlet, near the village of Jamestown, and proceeded down its valley to Warren on the Allegany river. This outlet is remarkably serpentine, but as the flats are wide, the canal will not require to follow its windings, but may be carried across from bend to bend, as designated on the subjoined map.

The distance, as we collected it from maps of actual surveys, is about twenty-four miles, and the whole descent is one hundred and thirty-two feet. We found no obstructions in this route, with the exception of about three-fourths of a mile of steep banks; but as these are not high or rocky, and the soil an easy loam, we did not consider them formidable.

About four and a half miles of this distance, from the heads of the first rapids, where we commenced taking levels, must principally be fed by the waters of the outlet, taken directly from this point; below which the Cassadaga and several other streams come in sufficient for a supply.

By using wood for locks, the whole expense of constructing a canal down this valley, including these and every contingency, will not much exceed three thousand five hundred dollars per mile, as will be seen by the following estimate:

Grubbing and clearing 24 miles, at \$400 per mile,	\$9,600 00
Excavating 4 feet deep, \$2,124 per mile,	50,976 00
Lockage 132 feet, \$75 per foot, average cost per mile \$412.50,	9,900 00
Contingencies at \$564 per mile,	13,536 00
	\$84,012 00

On our return from these examinations, we commenced at the mouth of the Conawango, where it comes into the Chataque outlet, and ran a level up to its source, making the summit at this place only six feet higher than the Chataque lake. We had been led to believe that we should find a sufficiency of water here to supply this level and the locks, as far as Cattaraugus creek, and also down the Conawango as far as necessary: but in this we were disappointed.

The streams in this quarter, during the dry season of the year, furnish very little water, and cannot therefore be depended upon. We ran a level to the south branch of the Cattaraugus, with a view of ascertaining the practicability of bringing it in as a feeder; but it was too low, and there was no longer any hope of finding water on this summit, except by the way of Chataque outlet, which I was satisfied could be easily effected, by maintaining the level along the south side of the ridge between Lake Erie and the valley of the Conawango, in a westerly direction, until it terminated at the point proposed, as delineated on the map.

* Chataque lake, as I was informed by Mr. William Peacock, agent for the Holland land company, contains by actual survey 16,000 acres, and is 18 miles in length. The depth in its middle will not vary from 30 to 100 feet. I gauged its outlet on the 24th of October last, during a severe drought, and it then furnished 2295 cubic feet of water in a minute.

Besides the water which would be here supplied for the use of this level and the lockage, from the summit at the head of the Conawango to Cattaraugus creek, (say 470 feet,) we shall be able to command several other considerable feeders, amongst which are Cherry and Clear creeks; the one furnishing about four hundred and the other about six hundred cubic feet of water per minute, even in the driest times.

The route, so far as I am able to judge from actual observation, and from the concurrent information of several intelligent persons, I have no hesitation in saying is practicable, and a considerable part of it favorable. The soil is easy, and unencumbered with rock: there will be no deep cutting, and but one considerable embankment, which will be at the Cassadaga outlet.

We did not run a level so as to ascertain where it would be necessary to cross the stream, and could not therefore determine as to the cost, but presume it would not vary much from \$15,000, including the culvert.

The other expenses may safely be put at \$4,500 per mile.

Distance 30 miles; amount of expense,	\$135,000
Embankment and culvert,	15,000

\$150,000

The face of the country from the summit at the head of the Conawango to Cattaraugus creek, is considerably cut up with ravines; but as they generally run parallel with the line which we wish to pursue, (especially if the southern summit be adopted, which we also examined, and which is probably the best of the two,) no very important inconvenience will be sustained on account of them, and we shall be enabled to choose our ground, in reference to the most direct and feasible route. The expense upon this part of the line, exclusive of lockage, may very properly be compared with that last above mentioned, except in relation to the culvert and embankment of Cassadaga creek.

Distance 5 miles, at \$4,500 per mile,	\$22,500
Lockage, 474 feet, at \$75 per foot,	35,550

\$58,050

I assume 474 feet of lockage at this place, knowing that the whole amount is 724 feet, and believing, from information, that the bed of the creek at Lodi is 250 feet above the surface of the lake. As the ground will be equally as favorable, or nearly so, and materials for the construction of locks as convenient, no great difference of expense will grow out of any error which may be committed in this calculation.

The point at which the Cattaraugus* can be most conveniently crossed, I think, is at Lodi: and this can best be effected by means of a dam. From this point we can easily wind out of its valley, and command its waters, which are amply sufficient to feed towards Buffalo.

Between the summit at the head of the Conawango and Buffalo, I did not deem it expedient to take any levels, as we had already ascertained the heights of the summits and the amount of lockage.

In proceeding from Lodi to Buffalo, we pass down upon the flats of Cattaraugus creek, which are often extensive, and always wide enough for the passage of the canal without any extra expense. In the distance of about six miles, we wind completely out of its valley on to the bank of the lake, which descends very gradually, and presents an even, regular surface. This continues all the way to Buffalo, with the exception of two ravines, one formed by the Eighteen-mile creek, the other by Clear creek, which must be passed by culverts and embankments with considerable expense. This, however, will not exceed, in my opinion, \$20,000 at each place. The excavation simply on this portion of the line will not cost above \$1900 per mile; but as there will be more culverts, bridges and embankments, here than on any preceding portion, I think the expense, exclusive of lockage and the two heavy embankments, may be estimated at \$5000 per mile.

Distance 30 miles, at \$5000 per mile,	\$150,000
Two culverts and embankments, at \$20,000 each,	40,000
Lockage 250 feet, at \$75 per foot,	18,750
Dam at Lodi,	2,500
	\$211,250

* This is a large and durable stream, and at all seasons of the year will afford not less than 5000 cubic feet of water in a minute.

In conclusion, I have only to add, that, if there be any thing to boast of in the patronage and support of a public company, Dr. Church has more to say for himself in this respect than the Messrs. Heaton; for whereas they have but very late issued proposals for such a company, while it is a considerable time since a company was actually formed for the purpose of working Dr. Church's carriages, not only on the road between London and Birmingham, but between Birmingham, Manchester, and Liverpool.

I remain, sir, your obedient servant,

IMPARTIAL.

Birmingham, Oct. 3, 1833.

On the Microscope—Method of Constructing, &c. [From Partington's British Cyclopaedia.]

The history of this instrument is veiled in considerable obscurity, and among the moderns the discovery of the microscope has been claimed by several individuals. The ancients appear to have been acquainted with it in one of its forms; for Seneca says, "Letters, though minute and obscure, appear larger and clearer through a glass bubble filled with water." In the middle ages this knowledge was lost. The invention of the modern instrument is attributed by the celebrated Dutch mathematician, Huygens, to a countryman of his, named Drebbel, who constructed them about 1621, or 31 years after the invention of the telescope. Borelli attributes it to Jansen, the reputed contriver of the telescope; Viviani to Galileo. The first compound microscope, consisting of two double convex lenses, seems to have been made by F. Fontana, a Neapolitan, who dates his invention from the year 1618.

The numerous forms of microscopes may be included under the heads of single, compound refracting, and compound reflecting microscopes. The theory of the *single microscope* may be thus explained: We all know that at a small distance we see more distinctly than at a large. If we look at two men, one 200 feet distant, the other 100 feet, the former will appear only one half the height of the latter, or the angle which the latter subtends to the eye of the observer will be twice that subtended by the former. Hence we must conclude that the nearer we can bring an object to the eye the larger it will appear. Now if, to render the parts of a minute object distinguishable, we bring it very near the eye, (suppose within one or two inches,) it will become very indistinct and confused, in consequence of the great divergence of the rays of light from the object, and the power of the crystalline lens of the eye not being sufficient to collect the rays whereby an image of the object may be formed on the retina at the proper distance on the back of the eye. Now, if we employ a single microscope, which consists of a convex lens, usually made of glass, (though any other transparent substance would have the same power in a greater or less degree,) and mounted in a brass setting, and place it between the object and the eye, the former being in the focus of the glass, the diverging rays from the object will be refracted and rendered parallel by the lens, and thus we shall obtain a distinct and near view of the object. The increase of apparent magnitude obtained by the employment of lenses is proportioned to the difference of the distance of an object from the lens and the dis-

tance when seen without its assistance. This latter distance, (the distance of distinct vision of minute objects with the naked eye,) varies in different persons, and at different periods of life. Some measure, therefore, must be assumed as a standard, before we can express the amplifying power of a lens, so as mutually to have the same idea of the magnitude of an object. Some authors adopt ten inches as the standard of the focus of the eye, under ordinary circumstances, and its decimal character makes it a convenient multiplier or divisor. With this decimal standard we can determine the magnifying power of lenses of any focal length, or formed of any substance (media). Thus, if we have a lens which requires for distinct vision the object to be one inch from its centre, (in a double convex,) we must divide the standard ten by one, which will give ten as the magnifying power. If the lens require the object to be $\frac{1}{10}$ of an inch distant, its magnifying power will be 250. We have called the magnifying power in the first instance ten, because the length of the object is increased ten times; but, as its breadth is also increased ten times, the real magnifying power of the lens is ten times ten, or 100. The common form of the magnifiers employed for microscopes is double convex, and they should be made as thin as possible; for the wandering or spreading out of the rays proceeding from an object when refracted by a lens with spherical surfaces, whereby an indistinctness is produced in its image, will be decreased as the square of the thickness of the lens employed, and the loss of light in passing through the lens is less in proportion as it is thin.

Within a few years diamonds have been formed into lenses in consequence of their high refractive power, whereby we can obtain lenses of any degree of magnifying power with comparatively shallow curves; and, as the dispersion of color in this substance is very low, the lens is nearly achromatic. Next to the diamond the sapphire possesses all the powers requisite for the formation of perfect magnifiers, and presents less difficulty in their construction; hence the expense of employing it is considerably less.

A *compound refracting microscope* is an instrument consisting of two or more convex lenses, by one of which an enlarged image of the object is formed, and then by means of the other, employed as an eye-glass, a magnified representation of the enlarged image is obtained. The distance at which the two lenses of a compound microscope are placed from each other must always exceed the sum of their focal lengths, in order that the image may be formed by the object-glass in the anterior focus of the eye-glass. Compound microscopes have been constructed of almost all possible dimensions, from a few inches in length to twenty feet; but from experience it appears that whenever their magnitude is augmented beyond a certain point the effect is diminished, though we suppose the amplifying power of both microscopes the same.

The *solar microscope* consists of a common microscope connected with a reflector and condenser, the former being used to throw the sun's light on the latter, by which it is condensed to illuminate the object placed in its focus. This object is also in the focus of the microscopic lens on the other side of it, which transmits a magnified image of it to

a wall or screen, (sometimes a combination of two magnifying lenses is used.) The magnifying power will be greater in proportion as the focal distance of the object-glass compared with the distance of the wall or screen from the object-glass is less. The principle of the *lucernal microscope* is the same, except that a lamp is used instead of the sun to illuminate the objects; this lamp is enclosed in a lantern, to screen the light from the observers.

Having thus given a general outline of the arrangement of the microscope in its various forms it will now be advisable to furnish our readers with such graphic and descriptive particulars as will enable any ingenious workman, reading this article, in conjunction with our treatise on Optics, (which will be inserted hereafter,) to construct the instrument. To render this systematic and intelligible, it may be advisable to commence with the most simple form.

A very convenient form of microscope is shown in the preceding engraving, where *b* is a circular piece of brass or ivory, in the middle of which is a small hole, one-twentieth of an inch diameter: in this hole is fixed, with a wire, a small lens, whose focal distance is *c d*. At that point is placed a pair of pliers, *g h*, which may be adjusted by means of the sliding screw, as in the figure, and opened by means of two little studs. The object may be viewed with the eye placed in the other focus of the lens at *a*; and, according to the focal length of the lens, the object, *f*, will appear more or less magnified, as represented at *i l*. If the focal length be half or one-fourth of an inch, the length, surface, and bulk, of the object will be magnified in a similar proportion. This small instrument may be put into a case for the pocket. Those lenses whose focal lengths are three-tenths, four-tenths, and five-tenths of an inch, are the best for common use.

Since the nearer the eye can approach to an object the larger it appears, it is plain, a double and equally convex lens magnifies more than a plano-convex lens; because, if the sphere or convexity be the same, the focal length of the former is but half that of the latter; and, since the double convex consists of two segments of a sphere, the more an object is to be magnified, the greater must the convexity be, and therefore the smaller the sphere; till at last the utmost degree of magnifying power will require that these segments become hemispheres, and, consequently, the lens will be reduced to a perfect spherule, or very small sphere.

If the radius of the spherule be one-tenth of an inch, the eye will have distinct vision of an object by means thereof, at the distance of $1\frac{1}{2}$ radius, (that is, three-twentieths

of an inch,) and, as this is but the fortieth part of six inches, the length of an object will be magnified forty times, the surface 1600 times, and the solidity 64,000 times, by such a small sphere.

If the radius of a spherule be but one-twentieth of an inch, then will the eye have distinct vision of an object at the distance of three-fortieths of an inch, and as this is but the eightieth part of six inches, the length of objects will appear eighty times greater, the surface 6400 times, and the bulk 512,000 times greater, to the naked eye at six inches distance.

In using these spherule microscopes, the objects are to be placed in one focus and the eye in the other; and since the focus is so exceedingly near the glass, it is impossible to view any but pellucid bodies; for, if any opaque object were to be applied, the eye being, as it were, just on the spherule, would entirely prevent any light falling on it, and it would be too obscure to be viewed.

To remedy this inconvenience, the focal length should be increased and a concave mirror substituted for the plate *b*. The object, *f*, being placed in the focus of the mirror, is illuminated by reflected light, and the most opaque insect may thus be seen with advantage to the naturalist. If the instrument thus arranged be directed towards the sun, the effect will be very materially improved; and when this cannot be accomplished, a sheet of white paper should be placed beneath the instrument.

The compound microscope, as made by Messrs. Jones, of Holborn, is shown in the engraving beneath. The body of the in-

strument, *a*, is screwed to the horizontal sliding arm, *c*. At *b* is a circular plate, containing a series of glasses, varying in their magnifying power. The objects to be magnified are placed in the stage, *e*, and the proper focus obtained by moving the rack at *f*. The lens *g* is employed to concentrate the light of a lamp, or that of the sun, on the object to be examined. The reflector at *h* has two mirrors, the one concave, the other flat. The whole instrument is supported by the pillar, *k*, and the triangular stand, *l m*.

The great facility with which objects can be represented on paper, or a rough glass, in the camera obscura, and copies drawn from them by any person, though unskilled in drawing, evidently suggested the application of the microscope to this instrument. The greatest number of experiments that appear to have been made with this view, were by Mr. Martin and Mr. Adams, the former of whom frequently applied the micros-

cope to the portable camera, and with much effect. But these instruments being found to answer only with the assistance of the sun, Mr. Adams directed his experiments to the construction of an instrument of more extended utility, which could be equally employed in the day and by night. He accordingly succeeded so far as to produce, by candle-light, the images of objects refracted from a single magnifier, upon one or two large convex lenses (of about five inches, or upwards, in diameter,) at the end of a pyramidal-shaped box, in a very pleasing manner, so as to give opaque objects, as well as transparent ones, the utmost distinctness of representation; but still the light of a candle, or lamp, was found generally insufficient to throw the requisite degree of illumination on the objects. The invention of the Argand lamp offered a complete remedy for this defect, by the intensity and steadiness of its light.

The advantages of this excellently-conceived instrument are numerous and important. "As the far greater part of the objects which surround us are opaque," says Mr. Adams, "and very few are sufficiently transparent to be examined by the common microscopes, an instrument that could be readily applied to the examination of opaque objects has always been a desideratum. Even in the examination of transparent objects, many of the fine and more curious portions are lost, and drowned, as it were, in the light which must be transmitted through them; while different parts of the same object appear only as dark lines or spots, because they are so opaque as not to permit any light to pass through them. These difficulties, as well as many more, are obviated in the lucernal microscopes, by which opaque objects of various sizes may be seen with ease and distinctness, the beautiful colors with which most of them are adorned are rendered more brilliant, without changing in the least the real tint of the color, and the concave and convex parts retain also their proper form. The facility with which all opaque objects are applied to this instrument is another considerable advantage, and almost peculiar to itself: as the texture and configuration of the more tender parts are often hurt by previous preparation, every object may be examined by this instrument first as opaque, and afterwards (if the texture will admit of it) as transparent. The lucernal microscope does not in the least fatigue the eye; the object appears like nature itself, giving ease to the sight and pleasure to the mind: there is also, in the use of this instrument, no occasion to shut the eye which is not directed to the object. A further advantage peculiar to this microscope is that by it the outlines of every object may be taken, even by those who are not accustomed to draw; while those who can draw well will receive great assistance, and execute their work with more accuracy, and in less time, than they would otherwise have been able to have performed it. Transparent objects as well as opaque may be copied in the same manner. The instrument may be used at any time of the day, but the best effect is by night; in which respect it has a superiority over the solar microscope, as that instrument can be used only when the sun shines.

"Transparent objects may be examined with the lucernal microscope in three or

four different modes, from a blaze of light almost too great for the eye to bear to that which is perfectly easy to it; and, by the addition of a tin lantern to the apparatus, may be thrown on a screen, and exhibited at one view to a large company, as by the solar microscope."

In the above engraving we give a view of this instrument, mounted to examine opaque objects. *b* is a large mahogany pyramidal box, which forms the body of the microscope; it is supported firmly on the brass pillar, *n*, by means of the socket, *m*, and the curved piece, *c*. *a* is a guide for the eye, in order to direct it in the axis of the lenses; it consists of two brass tubes, *l*, one sliding within the other, and a vertical flat piece, at the top of which is the hole for the eye. The inner tube may be pulled out, or pushed in, to adjust it to the focus of the glasses. The vertical piece may be raised or depressed, that the hole through which the object is to be viewed may coincide with the centre of the field of view; it is moved by a milled screw, which could not be shown in this figure. At *l* is a dove-tailed piece of brass, made to receive the dove-tail at the end of the tubes, by which it is attached to the wooden box. The tubes may be removed from this box occasionally, for the convenience of packing it up in a less compass. At the small end of the cone is placed a tube, which carries the magnifiers, one of which is represented at *c*; the tube may be unscrewed occasionally from the wooden body. Beneath the cone is placed a long square bar, which passes through and carries the stage or frame that holds the objects; this bar may be moved backward or forward, in order to adjust it to the focus, by means of the pinion, *k*. A handle furnished with a universal joint, for more conveniently turning the pinion, is shown at *o*. When the handle is removed a nut may be used in its stead. The stage, *h*, for opaque objects, fits upon the bar by means of a socket, and is brought nearer to or removed further from the magnifying lens by turning the pinion, *k*; the objects are placed in the front side of the stage. The two upper pieces of brass, *r*, are moveable; they are fixed to a plate, which is acted on by a spiral spring, that presses them down, and confines the slider with the objects: this plate, and the two upper pieces of brass, are lifted up by the small nut, *d*.

At the lower part of the stage there is a semi-circular lump of glass, *g*, which is designed to receive the light from the lamp, and to collect and throw it on the concave mirror, *f*, whence it is reflected on the object. The upper part of the opaque stage takes out, that the stage for transparent objects may be inserted in its place.

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 57.)

Did the reader ever notice how the walls of a house are assisted when thin and overburdened with a roof?

The *wall plate* is a portion of timber built into the wall, to which a transverse or tie-beam is attached by carpentry. This *cogging*, as it is termed, keeps the wall in the perpendicular, and prevents any lateral pressure of the roof.† We sometimes see a more clumsy contrivance, a clasp, or a round plate of iron, upon the side of a wall; this has a screw going into the ends of a cross-beam, and by embracing a large portion of the brick-work, it holds the wall from shifting at this point. Or take the instance of a roof supported on inclined rafters, A B:

Fig. 2.

Were they thus, without further security, placed upon the walls, the weight would tend to spur or press out the walls, which must be strong and heavy, to support the roof; therefore the skeleton of the roof is made into a *truss*, (for so the whole joined carpentry is called.) The upper cross-beam, marked by the dotted lines C, is a collar-beam, connecting the rafters of the roof, and stiffening them, and making the weight bear perpendicularly upon the walls. When the transverse beam joins the extremities of the rafters, as indicated by the lower outline, D, it is called a *tie-beam*, and is more powerful still in preventing the rafters from pushing out the walls.

Now, when a man bears a burden upon his head, the pressure, or horizontal push, comes upon the lower part of the *parietal bones*, and if they had not a tie-beam, they would in fact be spurred out, and the bones of the head be crushed down. But the temporal bone, D, and still more, the sphenoid bone, E, by running across the base of the skull, and having their edges lapping over the lower part of the great walls, or the parietal bones, lock in the walls as if they had iron plates, and answer the purpose of the tie-beam in the roof, or the iron plate in the walls. But the connection is at the same time so secure, that these bones act equally as a *straining piece*, that is, as a piece of timber, preventing the tendency of the sides of the skull to each other.

It may be said, that the skull is not so much like the wall of a house as like the arch of a bridge: let us then consider it in this light.

Fig. 3.

We have here the two parietal bones, separated and resting against each other, so

as to form an arch. In the centering, which is the wooden frame for supporting a stone arch while building, there are some principles that are applicable to the head.

We see that the arch formed by the two parietal bones is not a perfect semi-circle; there is a projection at the centre of each bone: the bone is more convex, and thicker at this part.

The cause assigned for this is, that it is the point from which ossification begins, and where it is, therefore, most perfect. But this is to admit a dangerous principle, that the forms of the bones are matter of chance; and thence we are left without a motive for study, and make no endeavor to comprehend the uses of parts. We find that all the parts which are most exposed to injury are thus strengthened: the centre of the forehead, and the projecting point of the skull behind, and the lateral centres of the parietal and frontal bones. The parts of the head which would strike upon the ground when a man falls are the strongest, and the projecting arch of the parietal bone is a protection to the weaker temporal bone.

If we compare the skull to the *centering*, where a bridge is to be built over a navigable river, and consequently where the space must be free in the middle, we find that the scientific workmen are careful, by a transverse beam, to protect the points where the principal thrust will be made in carrying up the masonry. This beam does not act as a tie-beam, but as a straining-piece, preventing the arch from being crushed in at this point.

The necessity of strengthening certain points is well exhibited in the carpentry of

Fig. 4.

roofs. In this figure it is clear that the points A A will receive the pressure of the roof, and if the joining of the puncheons* and rafters be not secure, it will sink down in the form of the dotted line. The workmen would apply braces at these angles to strengthen them.

In the arch, and at the corresponding points of the parietal bones, the object is attained by strengthening these points by increase of their convexity and thickness; and where the workman would support the angles by braces, there are ridges of bone in the calvaria,* or roof of the skull.

If a stone arch fall it must give way in two places at the same time; the centre cannot sink unless that part of the arch which springs from the pier yields; and in all arches, from the imperfect Roman arch to that built upon modern principles, the aim of the architect is to give security to this point.

In the Roman bridges still entire, the arch rises high, with little inclination at the lower part; and in bridges of a more modern date, we see a mass of masonry erected on the pier, sometimes assuming the form of ornament, sometimes of a tower or gateway, but obviously intended at the same time, by the perpendicular load, to resist the horizontal

* The puncheons are the upright lateral pieces; the rafters are the timbers which lie oblique, and join the puncheons at A A.

pressure of the arch. If this be omitted in more modern buildings, it is supplied by a finer art, which gives security to the masonry of the pier, (to borrow the terms of anatomy,) by its internal structure.

In what is termed Gothic architecture, we see a flying buttress springing from the outer wall, carried over the roof of the aisle, and abutting against the wall of the upper part, or *clere-story*. From the upright part of this masonry, a pinnacle is raised, which at first appears to be a mere ornament, but which is necessary, by its perpendicular weight, to counteract the horizontal thrust of the arch.

AGRICULTURE, &c.

DRILL MACHINE—IMPORTANT IMPROVEMENT.—Last year Mr. John Geddes, farmer and joiner, Cargen bridge, who some time ago received, from the Highland Society of Scotland, a handsome premium for the best turnip drill-machine now in use, invented an apparatus for sowing and harrowing, which weighs 50 lbs., may be purchased for the same number of shillings, and is so exceedingly handy that it can be attached in five minutes to a common plough, and set in motion to the astonishment of the sheeted seedsmen, and his friend the harrower, who foresee in this invention their occupation gone, with the exception of oats, and that too in the course of a few years. In the first instance, our friend drilled a field of barley, at the rate, not of 5, but 1½ bushels of seed per acre, and reared, notwithstanding, a full and fair average crop, and the calculation is that 12 shillings per acre for wheat and 10 shillings for barley may be saved on all the arable land in the country, placed under these descriptions of crop. Something, too, is gained in appearance: a succession of rows beautifully straight has a pleasing effect, and the opinion gains ground, that wheat thus raised will be easier reaped, and less liable to be lodged during wet weather. It is difficult to describe machinery in the absence of cuts; and all we say is, that the weight of the plough, by pressing on a wheel connected with the seed chest, causes it to revolve, and opens the valves with the greatest regularity. A small coulter cuts the soil to the proper width and depth, and no more; and two iron teeth, like the teeth of harrows, cover up the tiny drill, and complete the operation. From the position of the seed-box, nothing is trodden under foot: by reason of the wheel below the plough, the task of the horses is not harder than in ordinary cases, and a man, or even a lad, can plough, sow, and harrow, at the rate of one acre per day, or more. From the great breadth of oats planted, and the necessity which exists of breaking the stubborn glebe during winter, broadcasting this description of crop must still remain the favorite mode of husbandry; while, on the other hand, wheat and barley, from the success of the experiments already made, must, ere long, be drilled almost universally. By modifying the seed-chest and substituting one for another, according to the nature of the operation, potatoes may be planted, and beans and peas sown on the same principle. By means of an index, the quantity of seed required to be sown is regulated with mathematical accuracy, and can be increased or diminished according to circumstances.—[Dumfries Courier.]

[From the New-York Farmer.]
Suggestions relative to Farmers' Work for February. By the Editor.

Those of our subscribers who have the volume for 1833, will find an article on this subject at page 40. Its perusal may produce some good effect on the mind.

TAKING AN ACCOUNT OF STOCK.—During the last month a great number of the merchants in this city have been busy taking an account of their goods, debts and credits. By this practice they are enabled to ascertain whether they have made a profit or a loss. Let the result be as it may, the information is of much service in regulating their future course. Those farmers who have neglected to follow the example of the merchants should immediately set about it. The effect of taking an account of stock, and of keeping regular books, is very beneficial, causing the farmer to be more economical, more discriminating, more industrious, and more rational in his enjoyments.

MANURE.—Those who are in favor of fermented manure, and those who have greater facilities for carting into the fields in winter, should embrace favorable opportunities to cart it out from the yard, and deposit it in regularly formed heaps, where its juices will not wash away. In this state it will gradually ferment, and by the time it is wanted for use will be in a good condition. Manure should be collected into large heaps in the yard, and every kind of litter, ashes, pomice, &c. should be collected and deposited in alternate layers with the manure. If it is stirred once or twice and more litter added, it will be in a fine condition for use in the spring. Those who adopt this practice will find themselves paid in various ways. [See N. Y. Farmer, vol. 6, pages 327, 360.]

CUT HAY AND STRAW.—The advantages in using cut hay for horses, as well as cows and oxen, are the saving of one-third of the expense, and improving the condition of the stock, particularly those in years. [See N. Y. Farmer, vol. 7, pages 6, 11.]

SHEEP AND LAMBS.—But comparatively few farmers may be said to be very successful in sheep husbandry. There must be a cause for this, and every farmer, from public and private considerations, should make both observation and experiment. The inquiry should be made, are they less liable to diseases in summer than in winter and spring? At which season do they obtain food most adapted to their natures? In the season of vegetation they are fond of short, sweet pasture. In winter they generally get long dry hay, and often nothing else. This is sufficient to derange the system—to make the demands on the salivary and digestive powers too great. It would seem, therefore, that cut hay, mixed with a little bran, and occasionally salted a little, would be a more natural food. This, together with a few turnips, or other succulent food, would undoubtedly tend to invigorate them, and enable them to bring forth and sustain a more healthy progeny. Good covering, dry, warm, and spacious yards, are important. Some kind of condiment, too, is probably serviceable. [See present number, page 56.]

Cows.—Exposed to cold storms, when we have not an opportunity to stir sufficient to keep up animal heat, the human frame suffers much, and undergoes so great a derangement that death follows, if not soon relieved.

When cows are confined in a yard where they do not stir about as they would in a state of nature, they must certainly become greatly chilled, and consequently their appetites and digestive functions must suffer more or less. It seems unnatural that cows thus treated would bring forth healthy, vigorous calves. We are too apt to think that warm houses, thick clothing, and downy beds, were made for man, but the bleak heavens and the pelting storms for our domestic animals.

FREQUENT PLOUGHINGS.—When green crops or manure are turned under, it is evident that they should remain to ferment. If, however, the manure is fermented, it cannot be commingled too much. In an address before the South Carolina Agricultural Society, by Daniel K. Whitaker, we find reference to Mr. Tull's system.

A farmer, in that State, planted a field of Rye of seven acres, which he worked in the following manner. He ploughed one acre of the land; this he re-ploughed and ploughed another acre. He then ploughed the two acres already ploughed and ploughed a third acre, and proceeded in this manner, ploughing continually the land already ploughed, and adding an acre at each successive ploughing, till the whole field was completely ploughed. When this was done, the first acre had received seven ploughings, the second six, the third five, the fourth four, the fifth three, the sixth two, and the seventh one ploughing. He then cast in the grain, and harrowed it in, in the manner usually practised in the Eastern States. The result, as communicated to the Agricultural Society, was, that the product of grain harvested from each respective acre, was in exact proportion to the number of ploughings each acre had received; that which had received seven ploughings producing the most abundant crop, that which had received six ploughings, the next most abundant crop, and so on to that which had received only one ploughing, which produced the least of all. There is no doubt that by minutely pulverizing and frequently stirring the earth, and stirring it deeply, the product of a field may be greatly increased. But something more than this is necessary for him who would reap a succession of crops, in perpetuity, from the same land. He must give the plant food. He must supply it with a due portion of decayed animal or vegetable manure. It is a mistake to suppose that there is any principle of fertility in the primitive soils whatever, and this was the fatal error that lay at the foundation of Mr. Tull's system. Not all the pulverization which could be effected in the soil by a nine month's constant ploughing, would enable the planter to gather a crop of Cotton from a tract of barren sand.

FERMENTED AND UNFERMENTED MANURES.—Practical Agriculturists, (says Mr. Whitaker,) who have tried both the new and the old, prefer the old method. They find that the unfermented application creates too powerful a stimulus for healthy action in the plant, induces disease, and frequently kills, where it was only intended to nourish.

FOREIGN INTELLIGENCE.

FROM HAVANA, by the ship *Moro Castle*, we have papers of the 21st ult. They furnish no news. Our boatman, however, reports, upon the authority of a passenger, Capt. Trenor, of the *United States Army* that two days before sailing, he was informed by a merchant of Havana, that the intelligence had been received there from Spain, via Lisbon, that Mexico had called upon Spain to acknowledge her independence, threatening in case of refusal, a declaration of war against Spain. The inhabitants of Havana,

it is added, were in great dread lest the Queen should refuse, and war be the consequence. We see nothing of this in the *Diario*.

Barbadoes papers to Jan. 9th, received by the Savannah Georgian, contain the annexed intelligence, which possesses considerable interest:

Insurrection at Martinique.

BRIDGETOWN, Jan. 6.—By an arrival from Martinique, private letters have come to hand, which state that an insurrection had taken place amongst the slaves in that colony, and that in a skirmish between them and the military on the 24th ult., between 50 and 60 were killed, and 180 taken prisoners, with arms in their hands.

[The French brig *Adele*, Capt. Barron, at this port, left Martinique on the 29th Dec. Capt. B. informs us that the above account is much exaggerated. The slaves had no agency in the affair. Some free persons of color opposed themselves to the military; but before Capt. B. left, news was received that they had surrendered.—Eds. J. C.]

Yesterday morning the *Rosa*, a Spanish schooner of 75 tons burden, came into this port, a prize to H. M. brig *Despatch*, having on board 292 African negroes, consisting of 116 males and 176 females, between the ages of 10 and 18 years. The *Despatch* fell in with her on Christmas day, in lat 4, 30, N.; lon. 39, 16, W., bound, as she stated, to Havana.—On their arrival here, the captives were in excellent health, and seemed quite cheerful and contented.—The *Rosa* sailed last evening for Havana, under charge of an officer of the *Despatch*, to abide the decision of the mixed commission, when they will probably be declared free, and apprenticed out to whomsoever proposes for them, and the fortunate captors will be allowed £10 sterling per head for each—that is, provided they ever arrive there, which, from the leaky condition of the *Rosa*, on leaving this, is very questionable.

Latest from Africa, and Landers' Expedition.

BRIDGETOWN, JAN. 9.—By Captain Ellis, of the barque *Boddingtons*, which arrived here in distress on Sunday last, 70 days from Fernando Po, we have been politely favored with intelligence from the Coast of Africa, and with a corroboration of some facts which we had previously been made acquainted with. This vessel left Fernando Po on the 28th of October; her cargo consisted principally of palm oil, which, being put up in casks, some of which have proved to be unserviceable, leaked to such an extent as to create alarm for the safety of the vessel, a considerable quantity being pumped out every day. Capt. Ellis, accordingly, about three weeks since, found it necessary to steer for this island, as the nearest port he could fetch. The cargo, we understand, is being landed, for the purpose of the packages being repaired. We are happy to learn by this gentleman, that the health of Mr. Richard Lander, since he joined the steamer up the Niger, has greatly recovered. The *Columbine* sailed for Liverpool, with a cargo of palm oil, on the same day that the *Boddingtons* left, having on board as passenger Mr. Laird, one of the proprietors concerned in Landers' expedition. Mr. Laird has proceeded home for the express purpose of taking out another cargo to the interior, as the former goods were not adapted to the trade of the country. The mate of the *Columbine*, who succeeded to the command on the death of Captain Mitchell, had met with the like fate, had fallen a victim to the pestilence of the climate.—While Capt. Ellis was lying in the Cameroons river, six of the piratical crew belonging to the late schooner *Panda*, which was blown up, applied to King Agua, saying that they had been wrecked in a vessel bound to his river, and claimed his protection. The Chief believing their tale to be true, received them with kindness.

On the second day, four of them applied to Capt. Ellis and expressed their wish to get a passage to Bonny, Calabar, or New Calabar, and asked, if he could devise any means of getting there. Capt. Ellis having no suspicion of them, wrote a note to the sub-superintendent of Fernando Po, then at Bimbia, stating circumstances as they had related them; but the superintendent having been apprised by the Captain of His Majesty's ship *Curlaw*, of the circumstances connected with the capture and the destruction of the *Panda*, and the escape of the pirates, and a liberty sailor recognizing one of them as a notorious freebooter, they were immediately put in irons; upon which one of them offered to turn King's evidence against the others. A reward had been offered for the apprehension of the Captain of the *Pirate*, in consequence of which he was taken, and with the other men sent to Sierra Leone for trial.

See Summary, page 76.

NEW-YORK AMERICAN.

FEBRUARY 2-8, 1834.

LITERARY NOTICES.

No. XIII.

SALINE, (Washtenaw Co., M. T.) DEC. 7.]

I have just spent an hour with Mr. Risden, the Surveyor of a great part of Michigan, at whose public house I am now staying, in talking over the district with which he is familiar, and I shall avail myself of the information thus acquired, in filling up hereafter my notes upon the country. The conversation turning upon the healthfulness of Michigan, there was not one out of several residents present, who did not allow the existence of bilious fevers, and fever and ague in every part of the country; but they spoke of passing through these diseases as merely a slight process of *acclimating*, which in the general health of the country, was hardly to be considered. They asserted too, what I have before heard stated by more than one physician in the Territory, that Michigan is exempt from many of the diseases most fatal to human life at the East. Consumption, for instance, which a reference to the bills of mortality* will show, destroys as many in New York, take year and year together for several in succession, as does the yellow fever in New Orleans, is here unknown. Not only, I am told, do no cases originate here, but many persons from New York are pretended to have been cured of the complaint by coming to reside in Michigan. The most unhealthy points are in the vicinity of milldams, and of marshes, near both of which the settlers take particular pains to "locate." The first for the convenience of grinding and sawing, and near the last for the rich grass they afford with only the trouble of mowing. Health, indeed, is the last thing a settler seems to think of, by the way in which he chooses a site for his house. In a country so abounding with lakes and streams of the purest water, and filled with fish, that you may pass a dozen in a ride of as many miles, you but seldom find a house on their banks; while the purchaser of a new possession neglects alike the tempting looking oak opening, and erects his dwelling in the thick forest, provided only a road or trail passes within three feet of his door. A trail, by the way, I must tell you, is an Indian foot-path, that has been travelled perhaps for centuries, and bears here the same relation to an ordinary road, that a turnpike does to a Rail road in your State. He chooses, in short, the most fertile spot on his acres, in order to have a garden immediately around his house, which he places plump upon the road, in order to have it "more sociable-like, and see folks passing." His garden grows from almost nothing. The first year the hog pen and cow yard occupy the place designed for its commencement. They are moved further from the house the second year, and a few cabbages occupy the place which they have enriched by their temporary situation upon it. They move again on the second year, and the garden, which can now boast of a few currant bushes and a peach tree, expands over the place they have ceased to occupy. And now our settler having built a fine barn, and "got things snug about him," begins to like the look of the woods again, which he has so industriously swept from every spot that can be seen from his door. He shoulders his pick axe, he goes out into the woods, and selecting two of the straightest maple saplings he can find, they are at once disinterred, their heads chopped off to make these tall awkward things look civilized, and the pair of poles thrust into the ground within two feet of his door, are white-washed and called trees.

DEXTER, Washtenaw Co., DEC. 12.

I have been here two or three days; but so occupied in riding about looking at the country, that I have not till now attempted to finish this letter. Far different is the appearance of the cottages here from those described above, as the common residence of

new settlers. They build almost altogether in the oak openings; and as the country is now undulating, I have seen some cabins very prettily situated in clumps of oaks, a gun shot from the road, with fields of young wheat extending in every direction around them. The soil, when first turned up, is a kind of yellow gravel, very unpromising in its appearance; but it rapidly undergoes a chemical change, becoming almost black in fields of two years cultivation, and improving every season without the aid of a particle of manure. I have now got among the rolling land, in a region full of lakes and oak openings, of which hitherto I had only a taste. I need hardly say how much more grateful such a country is to my eye, than the level thickly timbered lands about Detroit and Monroe.

I came hither by way of the pretty village of Anne Arbour, which contains, I should think, seven or eight hundred inhabitants, many of whom, I am told, are very respectable English immigrants. I stopped at a farm house, about five miles from here, to dine. A white-headed boy of six or seven years old, was turning a grindstone before the door, while a couple of Indians sharpened their knives. Near them a miserable poney, with his wooden saddie covered with a freshly flayed deer, and a brindle wiry-haired dog, with the head of a wolf and the crest of a boar, skulked around the slaughtered game, and snarled in its protection, when, after dismounting, I approached it. His swarthy masters and myself entered the house together. *Tenepe keen chemowkomo*? ("Where is the white man?") said the oldest of the two to a very pretty Connecticut girl, who had recently followed her husband out to this country. She replied by pointing to him, working at a distance in a field, and the Indians sat down patiently till the farmer entered. The venison was then laid on a table, and a bargaining scene commenced, which lasted full half an hour. *Ceu-ne-shiu che-mocoman*. "No good, white man," said one of the red barterers, turning to me, as the white trader offered him what he thought too little for a whole deer. The bargain was struck, however, before a bystander could interpret the appeal for me. The skin still remained with the Indian, and I was not a little surprised to see produced from it a variety of articles of Indian produce, among which were large cakes of deer's tallow, about the size of an ordinary cheese. These were all traded away in succession, and a small cask produced by the Indian, was filled with whiskey on the spot; and the eldest mounting the poney, they both shook me by the hand, and soon disappeared with their poisonous burden, behind a turning of the road. They were of the Ottawa tribe, well-made men, though slightly built, and with aquiline noses and fine shaped heads, and each when I saw them, had the freest and most graceful step I ever saw, whether on the sod or in the ball-room. How complete was the metamorphosis when I overtook them half an hour afterward in the woods! The eldest, who could not have been more than five-and-thirty, was barely sober enough to guide his horse, and sitting with both arms around the barrel of whiskey on the pommel before him, he reminded me of an engraving of Bacchus in a very vulgar and not very witty book, called *Homer Travestie*. The Indian gravity which had before been preserved amid all the nervousness incident to a trading operation had now thoroughly deserted him, and toddling from side to side, he muttered a sort of recitative, which combined all the excellencies of the singing and reciting of a civilized toper. His companion, a youth of but seventeen, seemed perfectly sober, and stopping only occasionally to pick up the whip of the fumbling rider, he stepped so lightly by his horse's side, that the leaves scarcely rustled beneath his moccasins. I was somewhat pained, of course, at the exhibition, though I confess I was not a little diverted, while riding along for miles in the silent woods, with such grotesque company. The pedestrian continued as reserved and respectful as ever, but my fellow cavalier, after talking a quantity of gibberish to me, which was of course perfectly unintelligible, seemed to be at last quite angry because I could not understand him; then, after again becoming pacified, he found a new source of vehemence in urging me to "*schwap pasciche gun*," (trade my gun, to which he took a great fancy) for his "*paposhche pascocachee*," as he called a colt that followed the forlorn poney on which he rode. I could not help blaming myself, however, for having been so long diverted with the frailties of this hospitable Silenus, when at parting about nightfall where he struck into the forest, he gave me an invitation to his wigwam, 20 miles off, signifying the distance by raising all his fingers twice, at the same time using the words *hokee keen marchec neen wigwam*, (come to my wigwam!) How strangely are we constituted

that one should derive amusement in the woods from an exhibition which in a city would only excite pain and disgust. I have never seen a half-intoxicated Indian before without the deepest feelings of commiseration. As for the alleged crime of selling Indians whiskey, it is impossible to prevent it. The love of spirituous liquors is a natural craving of the red man, which is irrepressible, and as such I have heard the most humane and intelligent persons speak of it—people who have passed their lives among the Indians, and have done their best to snatch them from this perdition. The haughtiest Chief will travel a hundred miles for a pint of whiskey, and get drunk the moment he receives it, where soever he may be. Providence seems to have designed that this mysterious race should not continue upon the earth, and fate has infused a fatal thirst into their bosoms, which is hastening their doom with fearful celerity. But six years ago and the woods around me were alive with Indians, now they are only traversed by a few such stragglers as these. You may talk of civilizing them—but that too is impossible. You may more easily civilize the stupidest African than the most intelligent Indian—and yet who for a moment would compare the erect port and manly tread, the air, the blooded look of the one, with his keen sagacity and rare instincts, to the mishapen form, the shuffling gait and stupid bearing of the other? Where then lies the difficulty? The African is an imitative animal—the Indian is not. He will copy the form of your weapons, for he has felt their edge, and he will make himself ridiculous by wearing a cocked hat, because he conceives it to be an emblem of authority. Rings and bracelets he may wear, for they recommend him to his own tribe; but the forms and fashions of civilization he despises. The negro furnishes the best raw material for a dandy that can be had: he learns at once how to wear his hat and adjust his shirt collar according to the last mode of the white man. The Indian, if a fop, departs even further than usual from the costume of a European. He comes from nature's hands all that she ever intended him to be—the wild man of the woods. To the fleetness of the deer in traversing the forest, he unites the instinct of the hound in finding his way; and when you add to these the mental gift of a certain wild eloquence, wholly unimprovable by cultivation, you have nearly summed up the intellectual qualifications of the American savage—the genuine child of nature—the untamed—the untamable.

I had a long conversation on this subject yesterday, with a middle aged gentleman of high intelligence and character, for many years settled in the territory, and who has availed himself of unusual opportunities of studying Indian life and manners. We had been all day in a canoe paddled by ourselves, exploring a chain of small lakes in this vicinity; and the perfect stillness of the woods around, while floating at sunset over the transparent water, induced him to remark upon the rapid disappearance of the inhabitants; who, but six years since, when he first visited this part of Michigan, kept their canoes upon every stream in the country. The observation suggested the discussion, already alluded to, upon the feasibility of civilizing the Indians; and he told me a variety of anecdotes about a young chief with an unpronounceable name, whom, on various accounts he had once thought the fittest subject for social life he had ever met with among the aborigines. The conclusion of his relation was so whimsical and strikingly characteristic, that I will finish this letter with the details precisely as I took them down in my note book from the lips of my informant—our canoe, the while, being allowed to float as she listed along the placid bosom of one of those beautiful lakes into which the river Huron expands a few miles from its sources.

"As we came one day to the Indian encampment, Ketchewau-doug-enink caught me by the hand as usual, with his shrill exclamation of welcome, and my party proceeded at once to pitch our tent near his, before a blazing fire of logs. After affording us what assistance he could, the young chief left us; but in the evening he called in again at our tent, and brought his father and mother, his wife and three sisters with him. They all looked quite solemn, and in his manner, particularly, there was something altogether unusual. Young Ketchewau-doug-enink had been quite my friend, always appeared glad to see me, and was generally sociable in his way; but now he was grave and reserved, almost to severity. My familiarity with Indian character induced me to suppress every thing like surprise at such an extraordinary change of deportment, and we sat thus, I should think, for at least half an hour. At last the young Indian rose up in a formal way, and taking a position full in the light of the fire, began a speech abounding with gesture and vehemence. The amount of it was this: 'Listen, my friend; I see that you are wiser than any

of your white brethren." ["I must interrupt my story," said my companion, "to remind you that believing that my young Indian friend, who was a fine looking fellow, had some relish for civilization, and half a mind, indeed, to turn white man. I anticipated that some proposition to that effect would be the purport of his speech."] He continued—"I am glad to see that you love the Indians; that you are not ashamed of our mode of life. Let me tell you what I presume you already know, that the life of the white man is one of care and trouble. The Great Spirit has blessed his red children in a peculiar manner. We have no care. We are as *Sher-manitou** made us. We have not degenerated, but are still his favorites. You never see a wrinkle on the brow of an Indian. Look, my brother, at the forehead of my old father. It is as smooth as my own, though sixty winters have whitened his head. His days have glided on as undisturbed as the smooth stream before you."—[We were on the banks of the *Shiawasse*, interrupted the narrator.]—"Do you see, my brother, those pebbles in the bottom of the clear stream as it throws back the light of your fire? It is thus that every thought can be seen that dwells in the mind of the Indian. He has no disguise—no cause for it—the troubles of the white man disturb not the clear stream of his soul. Come with us—share with us the gifts of *Sher Manitou*—think no more of those distant lands of your childhood where men live but to harass each other, and gather riches that eat the soul up with care—come—here you will build your wigwam—I will help you—you shall have my sister for your wife—she shall weave your mats, and raise your corn, and dry your venison, which we will kill together in the woods. You have lived long enough a life of wretchedness; come and be happy with us."

I was curious to learn how the rest of the family, and especially the fair member of it particularly designated in this singular harangue, behaved while her brother was pronouncing it; and more than all, how the object of it himself received the address. I will endeavor to give you the exact replies of my interesting companion, without repeating the various questions from me which elicited them.

"My young friend sat down. Throughout his speech, the family observed the utmost silence. The lady in question was as indifferent as an Indian could be, at least in manner. They all looked at me for my opinion—the lady excepted. I will confess that I felt embarrassed, tho' I had but half a dozen Indians for my audience. An answer however was necessary. 'I thank you, my friend,' said I, 'and needed not this new proof of your friendship. I am sensible *Sher Manitou* has smiled upon you; that you are his favorite children. But we white men have been spoiled by education; we have been taught to think many things necessary that you red men can do well without; and inferior as our mode of life is to yours, it is not the least of its evils that it has unfitted us for the simple pleasures that *Sher-Manitou* every day gives you. I have friends and a mother far away to the rising sun. She does not know the red men, and might not be a mother to your sister. Your sister, if I should take her to the rising sun with me, would pine for her green woods and wigwam by the *Shiawasse*. She will doubtless be happier as she is. She will take for her husband some red man like yourself, who will love her, and prize the blessings which *Sher Manitou* yields you. I again thank you, my friend, and your sister. I must, after a few days, leave this country; but I shall bear my friends in my heart, and in the crowded city where the white men live, I shall often sigh for these green woods, and lament the absence of my red friends.'" H.

FANATICISM; by the author of the *Natural History of Enthusiasm*. 1 vol., N. Y.: JONATHAN LEAVITT.—What a magnificent and yet what a fearful subject is presented to an able, learned, and philosophical writer, in the single word which constitutes the title of this remarkable volume? Fanaticism! what of evil has it not accomplished, what of mighty, impassioned, and irresistible in our nature has it not been the means of developing? To write its history, to understand and appreciate its motives, to judge its deeds, good and evil, with impartiality, and to deduce from the wildest excesses of this universal passion—universal as having had existence in all time and among all peoples, civilized and savage—conclusions not wholly discouraging to, or dishonoring, the immortal longings of our nature, is the task undertaken in this work. The former book of the author on the

* *Sher-Manitou*, God; *Moow-Manitou*, the devil.

Natural History of Enthusiasm, preposessed us in favor of this one, and we have been in nowise disappointed in our anticipations. A profound, philosophical, and withal charitable and Christian spirit, pervades the whole work. The heart of man is depicted with a firm and skilful hand; and the disguises which self love interposes to prevent each one from classing himself with those where his character and propensities should in truth place him—from seeing himself, in short, as others see him—seem to be penetrated with a searching eye; and the workings of the passions are portrayed with startling fidelity.

The style is vigorous, rugged, and sometimes overstrained, yet always forcibly arresting the attention. The divisions of the work are somewhat arbitrary; and such as they are, they are designated by odd and fantastic titles. On this head, the writer thus explains himself:—

It will be better to seize upon certain leading varieties of our subjects, as marked by broad distinctions, easily traced in every age, and such as may be recognized, whenever they may recur, without hazard of mistake. These conspicuous varieties may be brought under four designations, of which the first will comprehend all instances wherein malignant religious sentiments turn inward upon the unhappy subject of them: to the second class will belong that more virulent sort of fanaticism which looks abroad for its victims: the third embraces the combination of intemperate religious zeal with military sentiments, or with national pride, and the love of power; to the fourth class must be reserved all instances of the more intellectual kind, and which stand connected with opinion and dogma. Our first sort then is *Austere*; the second *Cruel*; the third *Ambitious*; and the fourth *Factionous*.

Or, for the purpose of fixing a characteristic mark upon each of our classes, as above named, let it be permitted us to entitle them as follows—namely, the first, *The Fanaticism of the SCOURGE*; or of personal infliction: the second, *The Fanaticism of the BRAND*; or of immolation and cruelty: the third, *The Fanaticism of the BANNER*, or of ambition and conquest: and the fourth, *The Fanaticism of the SYMBOL*; or of creeds, dogmatism, and ecclesiastical virulence.

After these four divisions each treated at considerable length, follows the conclusion that "the religion of the Bible is not fanatical." This occupies two long sections, one devoted to the Old, the other to the New Testament—the whole written in the spirit of a pure, pious, and earnest Protestant.

It should be added, that this is the republication of an English work; and we see with satisfaction that the cognate topic of *Superstition* is next to be touched by the same vigorous hand.

THE SELECT JOURNAL OF FOREIGN LITERATURE.—No. V.—Boston, CHARLES BOWEN.—Sound judgment and discriminating taste continue to characterize the selections for this excellent periodical.—The *Life of Pym*, from the Westminster—a description by *Raoul Rochette*, translated from the *Journal des Savants*, of the large, and very remarkable mosaic found at *Pompeii*; and an original article, well done, on *Hamilton's Men and Manners in America*; are among the most interesting articles of this number. The critical notices, too, are instructive and various, while under the head of "Intelligence" a bird's-eye view is given of the movement of mind throughout Europe. To crown all, this Magazine is well printed.

CICERO, composing Vols. VIII, IX, and X, of the *Classical Family Library*, New York, HARPER & BROTHERS.—We are glad, after a long intermission, to find that this classical library is going on. It could not resume its progress under better auspices than those of Rome's great orator. The first two volumes contain the *Orations*, translated by Prof. *Duncan*. The third includes the *Offices*, translated by *Cockman*; and the *Essays on Old Age and Friendship*, translated by *Melmoth*. An accurate biographical sketch precedes the work; and at page 45 of it, is a letter from *Brutus* to *Cicero*, urging him to resist the tyranny of *Octavius*, just begin-

ning to bestride the Roman Empire, of which the sentiments might not be meditated in vain at this day.

IRELAND, A Tale by HARRIET MARTINEAU.—No. IX.—Philadelphia, E. LITTELL & T. HOLDEN.—A story of deep and thrilling interest, told with all the admirable writer's powers, is here produced to exemplify the silent miseries, which bad government, oppression, and ignorance entail on the Irish cottier, from generation to generation. It would be well for Ireland that both government and people would profit by the instructions of this well wrought tale.

YOUTH ADMONISHED—by J. THORNTON, author of *Bereaved Parents consoled*. New York: D. APPLETON & Co.—A well printed little pocket volume this, which in a brief view of the parable of the prodigal son, inculcates by modern instances, and much earnest discourse, the certainty that the paths of virtue are the paths of peace.

LITTELL'S MUSEUM OF FOREIGN LITERATURE, &c. for January. Philadelphia: E. LITTELL and T. HOLDEN.—We have only to speak in praise of this miscellany as embodying always a large proportion of well selected and amusing matter. The present number is ornamented with a fine engraving of a striking picture of the Deluge.

NORTH AMERICAN REVIEW, No. LXXXII. Boston: CHARLES BOWEN. New York: G. & C. & H. CARVILL.—The *Life of Cowper*, which is the first article in this number, is of itself sufficient to stamp it as an able and attractive one. It is written with a genuine admiration of the genius of this remarkable man, and a beautiful sympathy with the fearful trials to which his fine intellect and whole moral nature were subject. The admirers of Cowper will feel that justice is here done to his talents, and all gentleness exercised towards his infirmities. A good paper on botany and a capital one on *Story's Constitutional Law* precede a truly characteristic and interesting account of the American Whale Fishery—that hardest school of our hardy and adventurous seamen. Art. V, on the *last moments of eminent men*, is very pleasant reading—grave as the subject is. There is industry and good taste in the collection and arrangement of much anecdotal fact respecting the conduct of distinguished individuals, at the moment of entering upon the fearful passage to the grave. We have marked several interesting extracts, but with little hope of finding, for the present at least, any room for them in our crowded columns. Passing over other articles, we come to the concluding one, on *Hamilton's Men and Manners*, which is more bitter than able or well considered, save towards the close, when a better and higher tone is assumed and preserved.

THE TREASURY OF KNOWLEDGE AND LIBRARY OF REFERENCE, Parts IV, V and VI. New York: CONNER & COOKE.—This is truly what it purports to be—in a small compass a most abundant treasury of knowledge, on a vast variety of subjects. Part IV is a dictionary of quotations—V, *Sir Rich'd Phillips's Million of facts*, of which, if some few are spurious, the immense mass are correct—and VI is an *American biography*, brief but comprehensive.

LA REVUE FRANCAISE, for February; New York, HOSKINS & SNOWDEN.

LA FRANCE LITTERAIRE; No. : New York. BIBLIOTHEQUE CHOISIE DE LITERATURE FRANCAISE; Philadelphia, Carey Lea & Carey.—Here we have three French periodicals, each aiming to disseminate a knowledge of and taste for French literature. They are all comparatively cheap; well printed; and as to their contents well selected. We like the language well enough to wish that all may have abundant patronage.

It has been said, that *La France Littéraire* is got up to put down *La Revue Française*. The facts we believe to be pretty much these: the chief attrac-

tion to the mass of American subscribers to the *Courrier Francais*, is its literary character and extracts; and this, it was obvious, would be materially diminished by any publication which, in the more convenient and durable form of a monthly pamphlet, should give matter of the same character. Hence, in self-defence, the literary extracts of the *Courrier* were thrown into the same form; and as they are longer, *la France litteraire* is published once a fortnight instead of once a month, as *la Revue Francaise* is. It is, too, cheaper than *la Revue*, because the matter which composes it, serves for the two publications. In all this we see nothing but the proper regard, which every one feels, for his own interest; nor can it add to or derogate from the merit of either publication that it has a rival: on the contrary, each thereby will become more zealous to excel, and the reading public will be benefitted by the competition.

THE FOREIGN QUARTERLY REVIEW; No. XXIV; American edition No. IV: Philadelphia, T. W. Usick.—A good number—and then how cheap! three dollars per annum for a work that enlists such various talent. The article here upon the *Prussian System of Education*, that upon the *History of modern Italian freedom*, and that upon *Animal Magnetism*—in which the really surprising results supposed to have been accomplished by this revived *charlatannerie*, are most acutely examined—will recommend this periodical.

ENGLISH HISTORY ADAPTED TO THE USE OF SCHOOLS AND YOUNG PERSONS—by the author of *American Popular Lessons*. New York: R. Lockwood.—This is, with some modifications, omissions and additions, a republication—with what skill executed we confess we have not had time to examine; but we are willing to take it on trust, from the character and services of the lady, who presents it to the American public.

SUMMARY.

The Naval Lyceum is forming a collection of autographs of men of revolutionary fame. Among them they have obtained the following altogether remarkable letter addressed by John Hancock to Robert Morris:

COPY—"ON PUBLIC SERVICE."

Baltimore, January 24, 1777.

SIR—The Marine Committee, judging it of the utmost consequence that the *Frigate Virginia* should be got to sea as soon as possible, and finding it impracticable to procure here the necessary articles for the ship, without which she cannot proceed to sea, have determined to send to Philadelphia for them, and have sent the bearer, an officer of Capt. Nicholson's, to expedite the business; and I am now, in the name of the Marine Committee, to request you will immediately order such of the articles as are mentioned in the enclosed Memorandum, and can readily be got in Philadelphia, to be forwarded here without loss of time, in such manner as you shall judge best. The bearer will afford every aid in his power. I should think it would be no disservice in taking an Anchor and the Cables from one of the *Frigates* in Philadelphia, as you can with more ease replace them there, than we can procure them here; and all your *Frigates* are not in the readiness the *Virginia* is, and indeed she only waits for these articles. I submit it to you to conduct as you think best for the public service, but with respect to the Anchor and Cables, and Rigging, it is of the utmost importance they should be sent. Two carts put together would easily effect this, let the expense be ever so great; but care should be taken to prevent the Cables from chafing, by matting the turns, or putting canvass round the parts liable to rub against the wagon. But I need not give you any hints of this kind. I wish we may have as many of the articles as can be got, and I know you will exert yourself to effect this business.

I am, in behalf of the Marine Committee, Sir, your most ob't serv't,

JOHN HANCOCK, Chairman.

ROBERT MORRIS, Esq.

Member of the Marine Committee.

P. S.—The enclosed letters to Com. Hopkins I leave open for your perusal; please to seal and forward by 1st good op'ty.

GREAT FIRE AT ROCHESTER.

Correspondence of the *Journal of Commerce*—Rochester, Jan. 26.

We were visited this morning with a more calamitous fire than has ever before occurred in this village. About 5 o'clock it broke out in the Market, and before any effective exertions could be made by the firemen, the Market, which was of wood, and the block of wooden buildings extending from the Market on the west, to the Globe Buildings on the east side of the Genesee river, were enveloped in flames. From this block, it entered the Globe Buildings, an immense pile, near 100 feet square, six stories high on the west, and four on the east side, built of stone, which in less than two hours was burnt to the ground. The loss may be safely estimated at from 50 to \$60,000, a large part of which falls on Messrs. Newell & Stebbins, who owned the south half of the Globe Buildings, in which they had a Dry-Goods Store and a Carpet Manufactory. They had no insurance. The other half of the Buildings was owned by R. B. Post of New York, on which I believe there was some insurance. The other occupants of the Globe Buildings, were Edward Roygen, Warehouse for Wool and Skins, loss \$3000. Richard Van Kleeck, Hat Store—property saved. Williams & Merrill, Leather Store—loss \$1000. Jennings & Keeler, Leather Store—loss \$800. Quincey S. Odard, boot and shoe store—and about a dozen others occupying rooms for manufacturing purposes. The wooden block was of little value comparatively. It was occupied by J. O'Donoghue, auctioneer; Charles Smith, Reuben Leonard, E. S. Curtis, and one or two other grocers, and E. W. Collins, dry goods store. But a small part of the property was insured—probably, from what I have learnt, not to exceed \$10,000. The fire originated in a grocery under the market.

[From the *Quebec Gazette*, Jan. 24]

DESTRUCTION OF THE CASTLE OF ST. LEWIS BY FIRE.

This building, the residence of the Governor General of British North America for the last 150 years, and so prominent an object in the view of the city of Quebec from the harbor, as it surmounts the bank of the precipice between the Lower Town and the citadel, has fallen an entire prey to the flames. The fire broke out yesterday about noon, in a room at the south end of the building, in the third story, occupied by Capt. McKinnon, A. D. C.; and though early discovered, and every means taken to arrest its progress, it flew with astonishing rapidity through the upper story, and continued to burn downwards, in spite of all the exertions of the troops and about a dozen fire engines, until this moment. It now presents its hundred openings, all bare chimneys, and its sooty and ruined walls—a couple of engines still struggling to subdue the flames in the south wing.

It was originally built by the French at a time not exactly ascertained, and though somewhat altered in form and improved—particularly in Sir J. Craig's administration, at an expense of about £10,000 to the Province—the walls, we believe all remain, having successively escaped with trifling damage the sieges of 1759 by Wolf, of 1775 by the Americans, and the bombardment of Sir William Phipps in 1690. Its site, since the earliest discovery of the country, had been successively the headquarters of the whole French possessions, at one time extending over the present British North American possessions, including Louisiana and the Territories on the Mississippi; and between 1759 and the American Independence in 1778, was the seat of the principal command of the whole continent of North America.

It was tenanted, when the fire broke out by lieutenant Lord Aylmer, governor-in-chief, and Lady Aylmer; capt. McKinnon, Grenadier Guards, and capt. Devie, 24th reg't., aides-de-camp, and Lieut. Paynter, extra aide-de-camp; with the different domestics of the establishment. The military secretary (capt. Airay) occupied apartments in what is called the Old Chateau, a building erected by the English after the conquest, and chiefly used as dancing and dining halls. The public documents belonging to the Administration were early removed, as was the plate, and by much the greater part of the furniture, but the latter was damaged. His Excellency had £3,000 insured on the furniture, (which is purchased from the preceding Governor on every change) at the Quebec Office.

The thermometer on the morning of the fire had marked 221 below zero, and, during the whole time it lasted continued from 2 to 8° below zero, with a strong piercing wind from west to south-west. Many of the engines were soon frozen up, and the hose, and every thing connected with them, could only be

kept in any thing like order by the use of warm water, which was generously furnished from the breweries of Messrs. Racey, McCallum, and Quirouet, and by the religious communities. The citizens and troops distinguished themselves by their services; but from the impossibility of reaching the part of the building overlooking the precipice, it soon became apparent that any successful attempt to arrest the progress of the flames was hopeless.

It will probably cost £25,000 to £30,000 to erect a new building, but the beauty of the situation, and the extent of the grounds will afford an opportunity of erecting one of the most ornamental and prominent public buildings in the city, of which Quebec is really lamentably deficient. The site belongs to the Military Government.

Lord and Lady Aylmer remained for some time yesterday with Colonel and Mrs. Craig, where her Ladyship, we understand, slept last night. Lord Aylmer is at present at the residence of the Hon. Col. Gore, Deputy Quarter Master General to the Forces.

The fire raged with considerable violence during last night, and frequent alarms were given, some fear being felt that the houses in Champlain and Mountain streets, immediately at the foot of the precipice on which the Castle is built, would be set on fire by the embers carried over by the wind, or by the falling and blazing timbers, which descended down the steep declivity on the tops of buildings of into yards. Fortunately, the snow on the houses protected them, and no further accidents have occurred. Had the fire taken place in the summer, there must have been a great destruction of property in the lower town.

[From the *Frederick (Md.) of Saturday, Feb. 1.*]

WAR ON THE CANAL.—The account of the battles on the line of the Canal, published in another column, is said to be a little exaggerated, particularly as to the number of persons killed. Since the reception of these details, we have learned that a kind of guerilla war was carried on until Tuesday last, when a treaty of peace was formally entered into and signed; and are gratified to state, that lettees were received in town yesterday, stating that the different parties had returned to their respective sections, and peaceably gone to work. This, we hope will be the end of this affair. If however, a disposition is manifested to disturb the public peace, means will be at hand, promptly to chastise the offenders. For, in obedience to the requisition of the governor of this State, the President has ordered two companies of U. S. Troops to the line of the Canal, with orders promptly to suppress all violent proceedings. One of the companies from the Fort of McHenry, under the command of Capt. Mackey, fully equipped, with fixed ammunition, magazine, &c. passed through this city, via the Rail Road, on Tuesday. They are a body of fine looking men, and excited much admiration. They arrived at Williamsport yesterday, and will remain as long as their services are deemed necessary.

Nearly thirty of the rioters were apprehended in the vicinity of Berlin and lodged in the jail of this county on Thursday last.

[Correspondence of the *Journal of Commerce*.]

ROYAL GAZETTE OFFICE, BERMUDA, JAN. 3.—The derelict vessel mentioned in the last Gazette as having been found amongst the rocks off the West End of these Islands, and towed into El's Harbor, has since been righted, bailed out and discharged of her cargo, which consisted of pork, flour, sperm candles, brandy, and plank, almost the whole of which is spoiled. Even the pork is very much damaged. The name of the vessel, where from or where bound, has not been ascertained; for there were no papers discovered on board, and the vessel's stern was washed away. But little doubt seems to be entertained that she belonged to the United States of America. The pork bears the brand, "Boston, Oct. 1832." She must have been many months in the state in which she was found, for her deck was almost destroyed by worms. In her cabin the bones of human beings were found, and some wearing apparel having the names "M. Sever" and "C. Sever." The articles taken from her are in safe keeping.

The Boston papers, referring to a similar account received there, identify the vessel as the *Schooner Eliza Ann*, which sailed from Boston on 11th December, 1832, for Guayama, and had never been heard of. She was owned by Mr. James Brown, of that city, and on him the loss falls peculiarly heavy, having two sons on board of her, and Capt. E. his nephew. The cargo of the *Eliza Ann*, we under-

stand, corresponds with the statement, and the clothing undoubtedly belonged to Mr. Joshua Seaver, formerly an officer in the Boston Custom House, who took passage in the Eliza Ann, for the benefit of his health.

[From the Philadelphia Gazette.]

Disasters at Sea.—Extract of a letter from Capt. Curtis, of the packet ship John Wells, dated Cape Henlopen Roads, Jan. 30, 1834.—“I arrived here this morning. I have had one of the hardest passages I ever made, westerly gales all the passage—I was 15 days in the channel. In lat 48 06, lon 27 30, on the 22d Dec. boarded the British ship Asia, from Quebec, bound to London, water logged and a complete wreck. Capt. Stevenson and five of the seamen were drowned when the ship capsized, and Capt. Humbleton of the army. I took off the 1st and 2d officers and 11 seamen, they had been living seven days on a few beans. The men lost every thing when the ship capsized and are quite destitute.—[The Asia cleared at Philadelphia 23d Sept. for Quebec.]

U. S. brig Casket, Delaware Breakwater, Jan. 29.
Sir—I am sorry to inform you that the brig Amantea, took fire, while at anchor in this harbor yesterday. Immediately after discovering the fire I proceeded to the brig, with all hands from this brig, that could be spared, with buckets—on boarding her, found her to be on fire, fore and aft, below decks—finding it would be out of the question to put the fire out, I proceeded to the pilot boat Wm. Price for assistance, got the pilots Messrs. Edwards and Fuller, with some of their barges, went with me on board the brig. Immediately the pilots seeing her situation, thought most advisable to slip her cables, which was done, and run her on the beach, when she burnt down in a short time.

Had it not been for the assistance which this brig rendered, she would no doubt, have gone down, at her anchorage in the harbor. But little of any thing has been saved, the most saved is some sails and rigging—she may be considered nearly a total loss. The wind is now blowing hard from northward, and quite cold.

The brig Benj. Ruggless, and schr. Harriet; also, the pilot boats Wm. Price, and Mary Ann, are in this harbor. Respectfully yours
JNO. BURTON.

Very Distressing.—The Ship Brunette, which arrived at Boston on Saturday, on the 28th Jan., in lat 51 25, lon 68, fell in with schr. Chancellor Ross, from Portland, for Boston, with wood. Took off the Capt. and crew, all of whom were badly frozen; the eldest son of the captain died in an hour after being brought on board the ship, and Capt. Ross died on Saturday morning at 2 o'clock. Two others remain badly frost bitten, one of whom, the youngest son of Captain Ross, it is supposed, cannot recover. The schr. sailed from Portland, 21st and struck on a ledge the same night, received much injury, and was driven to sea nearly full of water. When the crew were taken on board the Brunette, the water was three feet deep on the schooner's cabin floor.

Melancholy Accident.—On Wednesday morning the 15th ult., the steamboat Westchester, while on her passage from Bridgeport to Norwalk, and when within a short distance of the latter harbor, fell in with a boat adrift. Captain Brooks immediately despatched his boat for the purpose of picking it up on reaching which, it was ascertained that a young man dangerously wounded and nearly lifeless was lying in her. It proved to be Mr. Charles White, of Norwalk. He had left Old Well early in the morning on a gunning excursion, and had with him a double barreled gun, which it is supposed he fired once, and in the act of re-loading the empty barrel, the contents of the other were discharged into his right arm near the shoulder. When taken on board, he was unable to speak; but after reaching home he articulated a few words. He died about 4 o'clock in the afternoon. Mr. White was an exemplary and worthy young man, and has left an affectionate wife to whom he had been married but a few months, and a large circle of relatives and friends, to mourn his untimely end. He was a son of Mr. Samuel White.—[Danbury (Ct.) Gazette.]

Boston, Feb. 4.—A check from the General Post Office, for \$7000, upon the Commonwealth Bank of this city, was presented at the counter of the Bank on Saturday, and protested for the want of funds; probably not for want of custom-house, but of Post Office deposits. The great deficiency in the Post Office Department has been a matter of notoriety for some time.—[Traveller.]

Large Organ.—The Organ, recently erected by Mr. Henry Erben in St. Philip's Church, is 26 feet in height, 16 feet in width, and 10 feet in depth. It contains three distinct rows of keys and pedals. The Great Organ contains ten stops, viz. Open Diapason, Stopped Diapason, Principal, Twelfth, Fifteenth, Tierce, Sesquialtra of four ranks, Cornet of five ranks, Flute, Trumpet. The Choir Organ contains five stops, viz. Stopped Diapason, Dulciana, Principal, Flute, Fifteenth. The swell contains seven stops, Open Diapason, Dulciana, Violano, Cornet of three ranks, Trumpet and Hautboy.

The Pedals of two stops. Double Open, Diapason and Open Diapason. The largest wooden pipe is 17 feet long and 16, 14 inches wide; the largest metal pipe is 13 feet long, and 10 inches in diameter, being the largest metal pipe in the United States. Total number, 24 stops, 1483 pipes, cost \$4000. Compass of the keys, from Double G. in the Bass, to Fin Alt. Compass of the Pedals, from double, double C. to one octave above. The case of the Organ is of the Corinthian Order, to correspond with the architecture of the Church, and is of elegant mahogany.

This Organ is the largest instrument of the kind in the Southern States. It combines with its great powers, stops of the most dulcet tones, and has been pronounced by competent musical men in New York and in this city a very superior instrument.—[Charleston Courier.]

[From the Albany Argus.]

NORTH RIVER BANK.—We will give below a statement of the condition of this institution on the 27th ult. as contained in a report made to the Senate on Saturday, verified by the oath of the President and Cashier, pursuant to a resolution of that body. It exhibits the affairs of the bank as being in a sound and prosperous condition.

Florida Steamboat.—The new boat built in Savannah by Mr. John Gant, has been some time launched. She is intended for the southern trade, and is called the Florida. Her engine has arrived in the brig Lela from New York, and we understand, will be put up with all despatch.

When she commences running, the line of Steam Navigation from Maine to Florida will be complete. A line of stages from Jacksonville, on the St. Johns River, to St. Marks, a distance of only 140 miles, and a steamboat between St. Marks and New Orleans, would render it the grand travelling route from New Orleans to the north. Starting from New Orleans in a steamboat, and disembarking at St. Marks, and taking a stage across to Jacksonville, E. F. the passenger could there embark on board this steamboat, and having arrived at Savannah, he could take his choice of going on in one of our fine packets, or continuing his route by steam to Charleston and thence northward. In this way a traveller could reach New York from New Orleans, with only one hundred and forty miles of land carriage!—We understand that such a connection between Jacksonville and St. Marks, is in contemplation.

The brig Draco, Bangs, at Baston from Cronstadt, reports having sailed, November 12th, from Elsinour, in company with ship Mount Hope for New York, and having passed her ashore on the Lapsand, having drifted on by the current, but supposed she got off next day.

[From the Norfolk Herald of Monday.]

ARRIVAL OF THE U. S. SHIP JOHN ADAMS.—The United States ship John Adams, P. F. Voorhees, Esq. Commander, arrived in Hampton Roads on Friday evening last—officers and crew all well. The John Adams sailed from Gibraltar, 1st November and arrived at Mogadore on the 5th; sailed thence on the 7th, and hove to off Madeira for several hours on the 10th, and sailed for Tenerife, where she arrived on the 16th; sailed thence on the 20th, and arrived at Cape Messurado 10th Dec., where they boarded the American brig Whim; sailed 14th December for Martinique, and arrived there on the 6th January—7th, boarded brig Sarah, 25 days from Bath, (Me.)—arrived 8th, brig Caroline, 13 days from Portland; 9th, schr. Pilot, of New York, 15 days from Newbern, (N. C.)—Sailed from Martinique January 12th—28th, in lat. 37, 06, lon. 71 min. 18, spoke Whale ship Findus, bound to New Bedford, and schr. Ocean, bound to Boston.

The John Adams left at Athens, 13th Sept. U. S. ship United States, Captain Nicholson, with Commodore Patterson, and family on board, bound to Constantinople; and at Port Mahon, 21st Oct. U. S. ship Constellation, Capt. Read, from Marseilles—all well. Spoke off Cape de Gatt, a few days previous to 1st Nov. U. S. ship Delaware, Capt. Ballard, from Gibraltar bound to port Mahon.

A French Corvette had arrived at Messurado, charged with presenting the thanks of its Government, for the hospitality, and kindness of the Colonial Cruiser towards the officers and crew of a French vessel which had been wrecked on the coast near Gorée.

The John Adams came up yesterday morning and anchored off the Naval Hospital, where she fired a salute, which was returned from the Navy Yard.

Passengers in the J. A.—Capt. J. H. Conkling, late of brig Admittance, of New York, sold at Gibraltar; Mr. P. S. Fish, of New York, late Captain's Clerk of Frigate United States, and Mr. Warren, of Boston.

List of officers attached to the United States ship John Adams, 1st Feb. 1834.

PHILIP F. VOORHEES, Esq. Mast. Comdt.
Thomas Pettigree, 1st Lieutenant.
Edmund Byrne, 2d do
Chas. H. McBlair, 3d do
Neal M. Howeson, 4th do
G. R. B. Horner, Surgeon.

J. Vaughan Smith, Asst. Surgeon.

Midshipmen.—F. V. Dilbergh, W. S. Ringgold, W. L. Hernden, C. Watkins, James Anderson, R. B. Pegram, N. G. Bay, J. H. North, F. E. Barry, B. F. Anderson.

William Waters, Boatswain.
David Taggart, Gunner.
Daniel Bane, Carpenter.
Madison Wheeldon, Sail Maker.
Frederick Farlie, Captain's Clerk.

Arrival of the Hon. Mr. Hamm, from Chili.—The brig Lady Adams, of Baltimore, anchored in Hampton Roads on Saturday evening last, in the remarkably short passage of 70 days from Valparaiso, via Coquimbo. Among the passengers in the L. A., was the Hon. John Hamm, Chargé d'Affaires of the U. States to the Republic of Chili, who came up to this place last evening in the steamboat Hampden, and will leave this morning in the steamboat Pocahontas, for Baltimore, via Annapolis. We have been obligingly favored with the following extract of a letter from a passenger on board the Lady Adams:—

“Mr. Hamm is the bearer of the Treaty of Commerce and Navigation which he concluded with the Chilean Government some time ago, and which was duly ratified by the President and Senate of the United States; but the time limited for the exchange of ratifications at Washington having expired, and sundry amendments having been proposed by the Chilean Congress, it became necessary, as I learn, to enter with the Plenipotentiary of Santiago into an explanatory convention, and to have again the whole matter submitted to the Chilean Congress for their approbation. These preliminary arrangements were all satisfactorily settled in November last, by the ratification of the Treaty, as well as the explanatory Convention, and an envoy was appointed to proceed directly to Washington, for the purpose of exchanging the ratifications, and reside near our Government. Senhor Don Manuel Carvallo, the Chilean Envoy, is also a passenger in the Lady Adams, and will proceed to Washington with Mr. Hamm, for the purpose of laying the whole matter before our Government, he being the bearer of the Treaty and Convention in the Spanish language.

MINT OF THE UNITED STATES.

Philadelphia, 1st Jun., 1834.

Sir: I have the honor to submit a Report on the general transactions of the Mint during the last year.

The coinage effected within that period, amounts to \$3,765,710; comprising \$978,550 in gold coins, \$2,759,000 in silver, \$28,169 in copper, and consisting of 10,307,790 pieces of coin: viz.

Half Eagles,	193,630	ps, making	\$968,150
Quarter Eagles	4,160	" "	10,400
Half Dollars	5,206,000	" "	2,603,000
Quarter do.	126,000	" "	39,000
Dimes	485,000	" "	48,500
Half Dimes	1,370,000	" "	68,500
Cents	2,739,000	" "	27,390
Half Cents	154,000	" "	770

10,870,790 \$3,765,710

Of the amount of gold coined within the past year, about \$85,000 were derived from Mexico, South America, and the West Indies; \$12,000 from Africa; \$368,000 from the Gold Region of the United States, and about \$13,000 from sources not ascertained.

Of the amount of Gold of the United States, above mentioned, about \$104,000 may be stated to have been received from Virginia; \$475,000 from North Carolina; \$660,000 from South Carolina; \$216,000 from Georgia; and about \$700 from Tennessee.

The annexed statement exhibits the quantity of gold received from the several districts of the United States which have thus far produced it in sufficient quantities to be an object of regard, commencing with the year 1824. Previously to that period, gold had been received at the mint only from North Carolina, from which quarter it was first transmitted for coinage in 1804. During the interval, however, from that date to 1823, inclusive, the average amount had not exceeded \$2,500.

Statement of the Amount of Gold produced annually from the Gold Region of the United States, from the year 1834 to 1835 inclusive.

	Virginia.	N. Carolina.	S. Carolina.	Georgia.	Tennessee.	Alabama.	Total.
1824	—	\$5,000	—	—	—	—	\$5,000
1825	—	17,000	—	—	—	—	17,000
1826	—	20,000	—	—	—	—	20,000
1827	—	21,000	—	—	—	—	21,000
1828	—	46,000	—	—	—	—	46,000
1829	\$2,500	134,000	\$3,500	—	—	—	140,000
1830	24,000	204,000	26,000	\$202,000	—	—	456,000
1831	26,000	294,000	22,000	176,000	—	—	528,000
1832	34,000	458,000	43,000	140,000	\$1,000	\$1,000	678,000
1833	104,000	475,000	66,000	216,000	7,000	—	868,000
	\$190,500	\$1,674,000	\$125,500	\$744,000	\$9,000	\$1,000	\$2,751,000

In the report of 1st January, 1833, it was remarked that the quantity of gold of the United States brought to the mint in the year 1832, was regarded, according to estimates entitled to great respect, as not much exceeding one half the quantity produced from the mines within that year; nearly an equal amount, being supposed to have been exported uncoined, or consumed in the arts. Nothing has since occurred to create a doubt of the correctness of

that conjecture. It is altogether probable, that the remark is equally true in regard to the last year, and that the amount of gold derived from the United States, within that period, has exceeded one million and a half of dollars. This sum, it is believed, is not less than about one fifth of the amount of gold produced within the same period, from all other sources, in Europe and America, estimated according to the best authorities.

I have the honor to be, with great respect,
your obedient servant,

SAMUEL MOORE,
Director of the Mint of the United States.
To the PRESIDENT of the United States.

Seamen's Bank for Savings.—The annual report of this institution, located in the city of New-York, was made to the Senate yesterday, showing the following result of the transactions of the year 1833, and the state of its funds :

Am't of deposits rec'd from 569 dep.	\$74,288 74
" Interest	4 255 16
" Stock redeemed	7,200 03
" in treasurer's hands at close of 1832	22,367 19

	\$188,111 12
Of this am't there was paid to depositors	\$70,625 61
Invested in U. S. Stock	8,590 99
Expenses	1,040 40
Balance in treasurer's hands	27,857 12

The total amount invested in stocks is \$66,165 28, and the trustees state that since closing the accounts for the year, they have been enabled to credit a rate of 5 per cent. per annum to each account not exceeding \$500, and to each account of larger sums, 4 per cent. per annum.

We understand that orders were yesterday received at the Navy Yard, to fit out the frigate Brandywine for sea *immediately*. It is not known where she is to go, but we presume the intention is to send her out to England with a new Minister, (Mr. Stevenson, probably,) and then to proceed to the Mediterranean station, to relieve the Constitution.—[Gazette.]

Mechanics' Bank of Patterson.—In consequence of the circulation of some unfounded reports abroad, in relation to this institution, added to the pressure of the times, a run has been made upon it for some days past. It has, however, promptly met every demand, and we are satisfied is in a perfectly sound condition; as a corroboration of which, from a source and of a nature that must command confidence, we are enabled to annex the following, from the Governor of the Society for Establishing Useful Manufactures:—[Patterson paper.]

We have about \$90,000 due to us in Patterson, for Lots sold. I will take Mechanics Bank Notes at the rate of ten per cent. premium for said debt—that is, every man indebted to us, who will pay one hundred dollars in Mechanics' Bank Notes of Patterson, within one month, we will credit him on his contract, one hundred and ten dollars. Yours, truly.

ROSWELL L. COLT,
Patterson, January 27, 1834.

RIOTS ON THE OHIO AND CHESAPEAKE CANAL.—The President of the United States, as we learn from the National Intelligencer of yesterday, has, on the resolution of the Legislature of Maryland, calling upon the General Government for aid in suppressing the riots referred to in the annexed article, ordered two companies of United States artillery to proceed forthwith to the scene of disturbance, and report themselves to the civil authority for orders.

RIOTS ON THE LINE OF THE CANAL.—We regret to have to inform our readers that the account of the pacification of the riot among the laborers upon the Chesapeake and Ohio Canal, above and below Williamsport (in Washington county, Md.) turns out to be premature. Since the return of the Hagerstown volunteers, with a number of men under arrest, fresh and fatal hostilities have broken out, in the course of which, as appears by the following account, a number of lives have been lost.—[National Intelligencer.]

WILLIAMSPORT, (Md.) JAN. 18.

Since the foregoing event, great commotion has existed among the hands. Very little work has been done, and a state of alarm and warlike preparation has taken its place. On Thursday last, we are informed, a party of *Corkonians* committed excesses along the line above this place. Yesterday morning a small party were seen approaching this place from above, and were met on the Aqueduct and driven back by an opposing party of their countrymen in the

town. In this affray one man was very seriously beaten and wounded. The citizens of the town, with commendable alacrity, soon put themselves in military order, under arms for the protection of the peace, and remained under arms for the balance of the day and the greater part of the night.

This scene was soon followed by another which resulted in a disastrous battle and several deaths. A party of Fardouns or Longfords, consisting of about three hundred men, headed by intrepid leaders, were announced as approaching from below. Their design they stated to be to pass up the line of the canal to the upper dam, for the purpose of exhibiting their strength, and not to commit a breach of the peace, unless attacked. They were armed in part with guns, but principally with helves, clubs, &c. They passed up quickly over the aqueduct, and on their way, as we learn, three or four hundred more of the same party fell into their ranks. At the upper dam, in a field on the other side of Miedlekauff's, they met the enemy in battle array, drawn up on the top of a hill, about three hundred in number, and armed, in part, with military weapons.

The information we have is, that the attack or at least a challenge to the combat, was made by the latter party. Volleys of shot were exchanged; some men were seen to fall, and the party above begun to fall back and disperse before the superior forces of their enemy. A pursuit ensued through the woods, where frequent firing was heard, and no doubt many lives were taken. *Persons who traversed the field after the battle was over, observed five men in the agonies of death, who had been shot through the head; several dead bodies were seen in the woods, and a number wounded in every direction.* Those who observed the battle describe it as one of great rage and most deadly violence. All the deaths and wounded are reported to have been of the *Coronians*.

About ten o'clock last night the victorious party returned, and passed quietly through this place, after halting a few moments in one of the public streets, to their respective sections and shantees below the town. Quiet was restored for the balance of the night.

We have thus attempted merely a sketch of the horrid barbarities committed in this neighborhood through the past week. The public peace has been outraged, and the civil authorities contemned. It remains for the officers of justice to take the necessary steps to repair these gross violations of the law.

Postscript—Since writing the above, a principal leader of one of the parties has been arrested for examination. The volunteer companies have arrived from Hagerstown, commanded by Col. Wm. H. Fitzhugh, who is also Sheriff of the County, and are now in readiness to aid the civil authority. An express has been dispatched to the Seat of Government for a sufficient regular force, to be sent on and stationed here, or at other suitable points along the line of the Canal, to preserve order among the laborers, and for purposes of general protection. (Banner.)

A Bank Blow-up!—We understand that there has been a blow up of a domestic Bank (not under the Safety Fund) at the village of New London, Oneida County. In other words, one of the most extensive gang of counterfeiters ever discovered in this State, has just been broken up at that place. Sixteen of the counterfeiters have been apprehended. Among this precious lot, we are informed that there is a lawyer, a tavern-keeper, and a constable!—[Albany Evening Journal.]

LOVE ME!

Love me—Love me—like the stars
That love to shine at night,
With sparkling eyes
In joy arise
To kiss the gloom and make it bright.
My heart—My heart is a gloomy veil,
That time has darken'd o'er;
But come with the light
Of thine eyes, star-bright,
And darkness shall be no more.
Love me—Love me—like the sun
That warms while it lightens too ;
Brings flowers to life
With sweetness ripe,
I care not for life without flowers to view.
My heart—My heart's a garden wild,
Its flowers are left to perish ;
But come like the sun,
And smile upon
The heart's garden roses, and cherish.
Love me—Love me—like the moon,
For the moon is chaste and bright ;
And Love to endure,
Must, like moonlight, be pure,
And stainless be in its light.
My heart—My heart's like a placid brook

That lies in a garden fair;
And the sun-rays at noon.
And the stars and the moon,
Must beam on and brighten there.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company.

WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 772 of this Journal.

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFFINISQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 8th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanical Magazine; Messrs. Ruhton & Aspinwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

300 do. 2 do. do.	
500 do. 2 1/2 do. do.	
soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axes of 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, and 34 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments, and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia. Models and samples of all the different kinds of Rails, Chairs, Flue, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

d71meowr

ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzel, Vellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thorburn is also Agent for the following publications, to wit:—

New York Farmer and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the New-York AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

TO RAILROAD COMPANIES.

PROFESSOR RAFFINISQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron rails to be laid in the United States within a few years and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his caveats filed in the Patent Office. Apply, post paid. SI R J M M & F

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.

J551f

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8

ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

m18

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Esq. M. & H. K. R. Co., Albany; or James Archibald, Engineer, Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, January 29, 1833.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted. Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.

German and Norrist. Railroad

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber. D. K. MINOR, 35 Wall street. New-York, August 14, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 16, 1833. A29d R M & F

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewin & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewin & Heartte.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of possessing the same.

At the commencement of the last year I offered to send the American tri-weekly instead of semi-weekly, together with two of my periodicals, in exchange to those who would publish my advertisements of the different periodicals. In consequence of this notice, the exchange list was increased to 165. I soon found that the expense would be greater than I had anticipated, yet I had made the offer, and would of course continue it through the year—as I have done. I however find it too expensive to continue to send as heretofore. The circulation of my PERIODICALS, (upon which the expense falls,) will not warrant it, and I must, therefore, notwithstanding the uniform kindness with which they have been treated by those to whom they have been sent, materially reduce their exchange list.

The semi-weekly American will hereafter be sent in exchange to those who will publish the following advertisements a few weeks for the difference of price. New-York, January 20, 1834.

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

D. K. Minor also publishes the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to

D. K. MINOR.

TO STEAMBOAT COMPANIES.

PROFESSOR RAFFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid, to R. J. M. & F.

MOON'S PHASES.

SOLAR AND LUNAR ECLIPSES IN THE YEAR 1834.—First, a small eclipse of the sun, on the 7th day of June, at 5 h. 2 m., invisible at New-York.

Second.—A total eclipse of the moon on the 21st day of June, in the morning, visible at New-York, as follows:

Beginning of the eclipse, at 1 h. 58 m.
Beginning of the total darkness, at 3 h. 1 m.
Middle of the eclipse, at 3 h. 43 m.
Ecliptical conjunction, at 3 h. 46 m.
End of total darkness, at 4 h. 25 m.
End of the eclipse, at 5 h. 28 m.
Digits eclipsed, 17 $\frac{1}{2}$ from the south side of the earth's shadow.

Third.—A large eclipse of the sun on the 30th of November, in the afternoon, visible at New-York, as follows:

Beginning of the eclipse, at 1 h. 6 m.
Greatest obscuration, at 2 h. 29 m.
Apparent conjunction, at 2 h. 30 m.
End of the eclipse, at 3 h. 47 m.
Digits eclipsed, 10° 36' on the southern limb of the sun, as represented in the following figure; the dark curved line represents the moon's centre across the sun from west to east.

The sun will be centrally and totally eclipsed on the meridian in latitude 40° 16' north, and longitude 23° 33' west from New-York.

The sun will be totally eclipsed at Charleston, South Carolina, and at Augusta, in Georgia, and many other places in the states of South Carolina, Georgia, Alabama, Tennessee, and Missouri, &c.

Fourth.—Of the moon, on the 15th day of December, in the evening, visible as follows at New-York:

Beginning of the eclipse, at 11 h. 4 m.
Middle of the eclipse, at 0 h. 20 m.
End of the eclipse, at 1 h. 30 m.
Digits eclipsed, 7° 40' on the moon's southern limb.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, FEBRUARY 15, 1834.

In this volume of the Journal, we conclude the publication of the report made by the Canal Commissioners upon the survey of the route for a canal from Rochester to Olean Point, on the Allegany river. This report, although occupying much space, will be found well worth an attentive perusal.

NEW METHOD OF APPLYING STEAM POWER.

—Mr. Brown, of Keeseville, has stated that he has invented a plan by which he proposes to dispense altogether with the use of an engine, thereby not only saving the important item of fifteen thousand dollars in the expense, but moreover the cumbrous bulk and ponderous transportation of an engine. He has entire confidence in the perfection and utility of this discovery, having tried the experiment "on a small scale;" and is taking measures to patent his invention, and to demonstrate its capacity early the coming season. Mr. Brown is an ingenious mechanic and worthy citizen of our village. Thus, with Burden's boat, Rutter's process of generating steam, and Brown's application of its power, we may soon expect to ride from Troy to New-York and back in twelve hours, and at an expense less than we could stay at home in "these hard times."—[Keeseville Argus.]

COAL STEAM BOILERS.—The construction of steam boilers of such a form as to admit of the use of anthracite coal for fuel, instead of wood, has long been a desideratum. In the engine and apparatus of the steamboat Novelty, it was first designed to use coal, but from some imperfection or obstacle then yet unsurmounted, in the arrangement and adaptation of the furnace and boilers, that design was abandoned. It is now understood that Dr. Nott has persevered in his experiments for the construction

of a boiler and furnace, in which coal may be used to greater advantage than wood, till success has crowned his efforts. But what the form or fashion of his contrivance is for this purpose, we are not informed.

We see it stated in a New-York paper, that a Mr. Disbrow, already favorably known to the public as an ingenious and enterprising mechanic, has likewise succeeded in constructing a "Lackawanna coal boiler," one of which is in operation on board the steamboat Delaware, and of which an individual who witnessed its operation says, "it accomplishes all the anticipations of the inventor."

Specification of a Patent for a New Manufacture of Wheels for Locomotive Engines and Cars, to run upon Railroads, granted to MATTHIAS W. BALDWIN, city of Philadelphia, June 29, 1833. [From the Journal of the Franklin Institute.]

To all whom it may concern, be it known, that I, Matthias W. Baldwin, of the city of Philadelphia, have invented a new and useful manufacture of wheels for locomotive engines and cars, to run upon railroads, and that the following is a full and exact description of my said invention.

Instead of making the wheels for the carriages of locomotive engines, and of other cars, or carriages, to be used upon railroads, of cast iron, or of a combination of cast and wrought iron, or of wood combined with cast or wrought iron, or with both, as they have been heretofore made, I cast the rims of such wheels, as well as in most instances the spokes and hubs, or naves, in one piece with the rims, of a composition of metal known to workmen under the name of hardened brass, or gun metal. It is not necessary for me to designate the proportions in which the respective metals are mixed which form the hardened brass or gun metal, as these will vary with the degree of hardness desired in the rim, or tread, of the wheel, in a manner well known to those conversant with the casting of brass and its compounds. Where it is desirable to increase the adhesion between the rail and the wheel, it may be found necessary to make the wheel proportionably softer, by decreasing the quantity of tin entering into the composition of them, or even to cast them of soft brass or of copper entirely.

I do not intend to confine myself to any particular form for the tread of the wheel, or for the spokes and hub; but to modify it in such way as experience may suggest to be the best adapted to the particular carriage or road to which the wheel is to be applied. I intend sometimes also, to cast the rim of the wheel of such metal without spokes, but furnished with

such flanges, lodgments, or projections, as shall enable me to attach thereto, spokes of wood, iron, or other material.

My claim to an exclusive privilege I rest entirely upon a new manufacture of such wheels, by substituting for their rims, or for every part of them, a new material as hereinbefore set forth, the utility of which consists in its being better adapted to the purposes which they are intended to answer in running upon railroads.

MATTHIAS W. BALDWIN.

On Saxton's Improved Method of Propelling Carriages. By A READER. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

In your number of 16th November last, you furnished your readers with the specification of a patent obtained in England by Joseph Saxton, for an improved method of propelling carriages. On reading it, I was very much pleased with the result promised, and at the same time rather incredulous, doubting whether the inventor had not deceived himself. I could not see through the principle, but did not think that any argument against the truth. I find I was not singular, for it is stated that "Many able engineers had found a difficulty in comprehending the principle." So, thinking it highly curious, and to put an end to my doubts, I made a small model. It works to admiration, and is the delight of every one who has seen it. It is a beautiful mechanical toy, but I am persuaded can never be used advantageously on so great a scale as railroad transportation would require. I had no intention of troubling you—it is the first time I have done so; but the subject has acquired new interest in my view, by the announcement, in a London paper, of some steps taken towards introducing the principle into practice.

I send inclosed the communication referred to, and I am, sir,
New-York, 3d Feb., 1834.

A READER.

EXPERIMENTAL RAILWAY.—A lecture was given, or rather a conversation was held, yesterday noon, at a temporary building and railway, situate in Park street, near the Gloucester gate, Regent's Park, on the "Economical, rapid, and safe travelling upon railways by means of Mr. Saxton's patent locomotive differential pulley; by which simple invention (the placard states) a horse, walking at the rate of

two or three miles an hour, will be able to propel a carriage at the rate of thirty miles an hour."

It appears that a few civil engineers and gentlemen being desirous of trying this invention, a piece of ground is formed into a railway of a quarter of a mile in extent, for the purpose of trying experiments, and yesterday the introductory lecture was given, and several models exhibited.

A Mr. Hawkins, who officiated, addressed the few gentlemen present, by observing that the railway was not in a sufficient state to try any experiments then, and he hoped no gentleman had come there under that impression; if so, his money should be returned. What he contemplated on the present occasion was to explain the principles on which Mr. Saxton's invention was founded, and to elucidate the same by models. This invention was calculated to propel a carriage at the rate of one mile in two minutes; the railway before them when completed would be a quarter of a mile in length, which distance and back, being half a mile, he anticipated performing in one minute. Ultimately he considered the distance from London to York might be performed in about six hours, and he did not despair of achieving in the same way a journey from the metropolis to Edinburgh in the space of one open day. The present invention was a new application of leverage, and one which was rather difficult to be understood, unless put in operation. Many able engineers had found a difficulty in comprehending the principle; but he would use his best endeavors to make himself clearly understood, and should feel happy in answering any question put to him. It consisted of having ropes, one mile in length, extending along the railway, and by means of Mr. Saxton's differential pulley, it was calculated that, with the power of one horse, a carriage, containing passengers to the weight of about one ton, could be propelled at the rate already stated of thirty miles an hour. It would require one horse to each mile, but whilst the carriage proceeded at the rate of thirty miles, the horse would only perform a distance of 150 yards; at the end of each mile fresh ropes were applied to the carriage, a fresh horse worked the second pulley, and thus it proceeded on the journey, a person being stationed at the end of each mile to effect the change of gearage. By these means, it was asserted, the greatest acclivity might be ascended, and the experimental railway would be so formed as to show its effect in this particular, part of it being on the same scale of declivity as Shooter's Hill, or one foot in ten. He next proceeded to show, by means of diagrams and models, the mode in which the propelling force was acquired by the newly invented pulley, and then proceeded to state that it was not his intention to run heavy carriages on the railway. One ton, he thought, would be quite sufficient, because, when they could send ton after ton at the rate of thirty miles an hour, and without any delay between, carrying great weights was unnecessary. On the present plan of locomotive engines, it was indispensable that they should be formed to carry heavy weights, because the locomotive engine generally weighed ten tons; and that great weight, being in a state of agitation, wore out and damaged the road infinitely more than all the traffic that passed over. It was found also that one locomotive engine required three times as much fuel as a stationary engine of the same power. It was his intention to use horses, because one horse power would be sufficient for his purpose; and it was found that there was no saving in using engines under six-horse power, it being as cheap to keep six horses as to work a six-horse engine. There would, in this way, be a great saving in the expense of the power; there would also be a great saving in the construction of the railway. At present a yard of railway weighs 50 lbs.; his would weigh less than half. At present hills are cut down, and valleys raised, to make a railway; by the proposed plan this would be unnecessary.

Mr. Hawkins, having concluded his lecture, answered several inquiries made of him by gentlemen present, and received their best wishes for his success. In the course of the conversation, he mentioned that the manufacturer who had made the rails for the company was now executing an order from America for 1,000 miles of railway.

THE GENESEE AND ALLEGANY CANAL.

(Continued from page 69.)

Part of the Route from Rochester to Allegany at Olean, through the Valley of Genesee River.

It has been ascertained that the principal objection to this route is the difficulty at Nunda falls, at which place the banks are steep, high and rocky, and run close into the shore. In addition to this, there are three perpendicular falls in the distance of a mile and a half, amounting in the whole to 274 feet. By a reference to the map, it will be seen that the river here makes a very circuitous bend, embracing a narrow neck of land which rises high above its bend.

Having only passed over this neck without measuring the distance, I could not form an adequate idea of its width, but am of opinion it will not vary much from 200 rods in its narrowest place, and that its height will not fall short of 200 feet. To encounter the difficulty at this place, therefore, it was obvious that the expense must be great, and it was hoped that some other could be found more feasible and better suited to the importance of the object.

The appearance of the map indicated two favorable points, to wit, the valley of the Cushequa and Canasara. And several intelligent gentlemen residing in that quarter were of opinion, that by keeping up the river a short distance, and preserving the level along its banks, we might easily wind out of its valley, and rise above the high lands at the heads of these streams.

To effect this, therefore, was the object of my examination. We commenced at a place called Norton's farms, near the middle of the east line of the town of Nunda, in a valley which opens through the country in an eastern and western direction, and is bounded on the south by an extensive range of hills nearly parallel to it, and which appear to be of a uniform height. Here we found the main branch of the Canasara, which heads in the hills several miles to the north, and comes into the valley from that direction, and then winds off towards the east. We commenced our level in reference to this stream, and took a westerly direction along the valley.

No obstruction appearing in our way until we came to the Cushequa. The banks of this stream are high and wide, and should the Canasara route be adopted, it must be crossed by culvert and embankment with a heavy expense. At this place the land begins to ascend.

We soon run up to sixteen feet, and within two and a half miles to fifty-eight feet, when we came to an abrupt ridge two hundred and one feet above our level, which extends quite to the river, and precludes the hope of getting round. The descent from this point to the bed of the river is four hundred two feet, and consequently below our level two hundred and one feet. To surmount this, allowing the descent in the river to be eight feet in a mile, (and it will not vary much from it,) it is evident we must go up a little more than twenty-five miles, and as the canal from the Allegany will probably come into the Genesee river at the mouth of Black creek, it is likely it may be difficult to unite the two without some extra expense.

As we did not measure the distance, and do not know any thing of the texture of the soil except from external appearances, our calculation of expense must be uncertain and liable to error. But as it may be desirable to know something on the subject, I submit the following estimate.

The distance of deep cutting from 16 to 58 feet, will be 2 1/2 miles, and the amount of excavation, 1,510,422 cubic yards.

The earth is of a light loam, and a considerable part of it may be excavated for eight cents per cubic yard. But when we take into consideration the depth of cutting, and the distance to which much of the earth must be carried, I am of opinion the average expense will not fall short of 25 cents per cubic yard. This item then amounts to \$377,605 55.

The ridge from whence it begins to rise abruptly to where the level cuts it on the opposite side, is about one hundred rods through, and to make a semi-circular tunnel this distance of thirty-four feet span, which will only give sufficient space for an arched wall 28 feet span and three feet thick, would require the excavation of 27,744 cubic yards. I mention this size because it would be sufficient to admit the pas-

sage of two boats at a time, such as are used on the Erie canal, and any thing less than that would, in my opinion, so incommode the navigation as to more than counterbalance the difference of expense. What the expense of this excavation would be must depend upon the quality of earth through which we must pass. But supposing it to be favorable, as external appearances indicate, it would not fall short of fifty cents per cubic yard, which will amount to \$13,872.

The arch way would contain 14,608 perches. For this work stone can be had within four miles, and in that case the expense may not exceed four dollars a perch, making the sum of \$58,432. As to the expense of making the canal along the bank of the river I think we could not reasonably estimate it at less than \$6000 per mile, including grubbing and clearing, and all the contingent expenses. Distance twenty-five miles—\$150,000. Here then we have an aggregate expense of \$599,909 55.

While at Greigsville, we were informed that a connection might be very advantageously formed between Rush Creek and the west branch of the Cushequa, as these streams rise in the same swamp; but upon examination we found the lands so high as to put that route entirely out of the question. It should be here mentioned, that whether the Canasara or Cushequa route is adopted, the difficulties mentioned above must be encountered, as they are common to both. The Cushequa route is shorter by several miles, and may perhaps be preferable on that account.

The Canasara, at Danesville, is a very commodious mill stream; and I know of no place in the western country, (with the exception of Rochester,) so well calculated for hydraulic operations; and should it ever be deemed expedient to form a connection with the Susquehanna river, there is no point perhaps more eligible than that between Arkport and one of the branches of that stream. The distance between the two points is short, and there are no obstructions in the way. I have seen the ground, and speak with confidence.

I was requested by Judge Bouck to make some examinations on the Allegany river, in relation to the improvement of its navigation. It not being convenient for me to attend to it myself, I engaged Mr. Cantine, my assistant at that time, to go down as far as Franklin, and collect such information as he supposed might have a bearing on the subject. The result of his inquiries he has communicated to me in a letter, a copy of which is herewith transmitted.

On his return, he informed me, that the distance from Warren to Franklin was sixty miles, and the descent of the river between the two places, was 189 feet. That the west bank, particularly, was very favorable to the construction of a canal, with the exception of 3 1/8 miles. This distance, though more expensive than the rest, was by no means impracticable. The bottom of the river stony, but generally free from rock. No bluffs or sliding banks the whole distance. Materials of every description necessary for the construction of the work were very convenient, and in great abundance. He also learned from various respectable sources, that these remarks were generally applicable to the whole distance to Pittsburgh. Such being the facts, the cost per mile of making a canal from Warren to Franklin, exclusive of lockage, may not exceed \$6000. This distance, being sixty miles, the expense amounts to \$360,000

Lockage 189 feet, at \$8⁰⁰ per foot, 14,175

\$374,175

Now allowing the average cost per mile, from Warren to Franklin, to be applicable to the distance from Warren to Pittsburgh, we shall perceive that as the one is \$6,240, nearly, and the other two hundred miles nearly, that the whole expense of that distance will amount to \$1,248,000. And we also perceive, that allowing these and the calculations made for the second route, as communicated in this report, to be true, that the whole expense of making a canal navigation from Buffalo to Pittsburgh will not be equal to \$2,000,000.

Now if the State of Pennsylvania will but bring forth her science and resources to this mighty enterprise, she may, in conjunction with the State of New-York, effect a work which, for its importance in a commercial, agricultural, and national point of view, cannot be equalled by any other similar undertaking in the Union.

The above is respectfully submitted by
CHARLES T. WHITFO.

Murray, January 28, 1826.

(Copy of Mr. Cantine's Letter.)

Dear Sir: Agreeably to your directions, I proceeded down the Allegany from Warren to Franklin, in Penn.

sylvania. I left the former place on the 8th day of October last, accompanied by a gentleman selected by the citizens of Warren as a man the most capable of giving correct information of the operation of the floods, and of the river generally.

The stream was uncommonly low, which afforded the best opportunity of viewing its bottom. From the best information I could obtain from the citizens of Warren, I was of opinion the west side afforded the greatest facilities, and my examinations were therefore principally confined to that side. My examinations may be classed under three heads. First, the descent in the river, by estimating the fall in the river by the different ripples, by comparing them with the two we had ascertained with the instrument. Second, to ascertain if the stream could be improved by damming, and locking, and canalling from one dam to another. Third, canalling on the west side, to be supplied with water from the river or the streams that fall into it.

1st. Estimating the descent, I judge it to be one hundred and sixty feet; but on my return to Warren, on searching the prothonotary's office, I found by comparing our levels with a report made by commissioners appointed by the legislature of Pennsylvania, to survey a route for a canal from lake Erie to the Alleghany river at the mouth of French creek, I found the descent to be one hundred and eighty-nine feet. Those commissioners, in their report, regret that it was not in their power to procure an experienced engineer with proper instruments to investigate the route: it is, however, probable that that report is nearly correct.

2dly. Draining the river, &c. The reason why this mode of improvement was suggested, is, that it was feared the banks of the river would be so steep and difficult as to prevent the construction of a canal. To avoid this difficulty, several dams would be necessary, but it would be impossible to determine their location or number; not knowing the descent in the river from one point to another, and believing as I do, that it would be better to construct a canal on the west side of the river, I shall therefore proceed to the result of my examination on that head.

3dly. Canalling on the west side, &c. The distance from Warren to Franklin is sixty miles. Sixteen miles of this, the side-hill comes down to or near the water's edge, at seventeen different places; which is moderately steep. At almost each of those there are several rods together, where there is a margin sufficiently elevated above the river, and wide enough to admit of a canal.

There are three miles of steep side hill; soil the whole of this distance of the sandy order, some places loamy with some detached masses of rock. The river along this distance not to exceed ten feet deep at any one place where it would be necessary to construct works for a defence to the canal, and the greater part of the distance less than three feet deep.

The bottom of the river, the whole distance, was stony, and all the information I could obtain from the old settlers, as to the changes of its channel and banks, agreed that they were few and gradual, and the uniformity of the descent, the appearance of its banks, the great width of the stream, and its appearance generally, unite to show the information correct. There is not a bluff or sliding bank on the whole shore. A covering or lining of stone on the outer side of the tow-path, sloping at two to one, would be sufficient to protect it from the effects of the river; the stone for this purpose in many places would be obtained in digging the canal, and at other places from the bed of the river.

There are two chains of rock bank in horizontal strata; they will admit of being easily broken up; the bed of the stream at this point is rock, thinly covered with loose stones, which, when I viewed it, was but partially covered with water. There is good earth convenient to this place, to form the canal, and the stone for covering may be taken from the bank or the bed of the stream; the river is of good width here.

The residue of the distance, the canal may be carried through favorable ground at or near the foot of the hill, altogether out of the reach of the floods of the river.

As to a supply of water, on this subject there can be no difficulty. There are a number of streams that fall into the Alleghany on the west side, and their descent is sufficiently rapid when they enter the valley, to be made use of as feeders, and to be crossed conveniently, the largest of which are Broken-straw, Oil and French creeks; there is every material necessary for the construction of the work in the vicinity where it will be used. The most intelligent gentlemen in that quarter united in stating that the river was of the same character from Franklin to Pittsburgh.

I was cordially received by the citizens of Warren and Franklin, and every information in their power afforded. Most respectfully, your obedient servant, ABM. CANTINE.

To C. T. WHIPPO, Esq.

To the Honorable the Board of Canal Commissioners of the State of New-York,

I take the liberty to address the following report:

That the following examinations have been made by your orders, for the purpose of ascertaining the practicability of constructing a canal, and of supplying the same with water, to connect the Erie canal with the Alleghany river, by passing the village of Batavia, and up the valley of the Tonawanda creek, to a summit to be formed between Cattaraugus lake at the northeasterly, and Lime lake at the southwesterly extremity, and thence descending by the valley of the Ischua and Olean creeks, to the Alleghany river at Olean Point.

For which purpose I commenced the 6th October, 1825, at the level of the Alleghany river at Olean Point, at which place it is ten rods wide, and sends forth 12,236 cubic feet of water per minute. From thence an accurate level and measurement of distances was carried up the Olean creek 7 miles and 42 chains, to its junction with Oil and Ischua creeks in the township of Hinsdale, and found the rise to be 37.79 feet between the Alleghany and Oil creek. Oil creek at its junction yields 551 cubic feet of water per minute, in the driest weather. From the mouth of Oil creek, the level and survey were continued up the Ischua through the townships of Franklinville, Farmersville and Yorkshire, to Lime lake, a distance of 27 miles and 66 chains from Olean Point; and the total rise from the Alleghany river to Lime lake is 233.63 feet.

A canal from Olean to Lime lake would pass through a valuable tract of country, well cultivated, and abounding with pine and oak timber of the first quality. The soil is a sandy loam, easily excavated, and the surface is generally very regular on the line of canal. The summit dividing Ischua creek from the south end of Lime lake, is about one mile in length, through a tanrask swamp, and rises on an average six feet above the surface of Lime lake. Suitable stone for locks, &c. can be found along the line at convenient distances.

From Lime lake, (which is the summit,) the summit level was carried in a direction towards Cattaraugus lake, and it is ascertained that Beaver lake is 62 feet, and Peacock lake 53 feet above Lime lake; and both these lakes have several smaller ones connected with them, it is evident their waters can all be brought on the summit level.

Cattaraugus lake was found to be 22 feet above Lime lake, but being on the line of the canal, it must be cut through, and also a dividing ridge at the northerly end of the lake, which rises 15 feet above the level of the lake, and runs out to the level in 25 chains. From Lime lake to the north end of the deep cut, the summit level would be 24 miles, and the ground generally favorable, though in many places sidelying and steep, and all may be called heavy timbered land. The only deep cut unavoidable is through the Cattaraugus lake and the dividing ridge. The cutting through the lake would be 26 feet for half a mile, and through the ridge 41 feet for near one-fourth of a mile. The average cutting for two miles is about 20 feet, and it is to be presumed that rock would be met in those depths.

From the northerly end of this deep cut, the country slopes gently to the north, and the canal would follow the valley of the Tonawanda creek, which would be the principal feeder, and runs through a country of excellent soil and highly cultivated for 30 miles, to Batavia, and thence 20 miles further (having a choice of ground the whole distance) to the Erie canal. The whole distance or length of the Batavia and Olean canal is 101 miles and 66 chains.

The water to supply the summit level of this canal is as follows, viz:

The west branch of Ischua creek to be turned into Lime lake, yields per minute		200 cubic ft.
Lime lake, from a surface of 150 acres, per minute	150	"
Beaver and Fish lakes do.	240	"
acres, per minute	200	"
Peacock & Mud l. Cl'r cr.	250	"
acres, per minute	700	"
Cattaraugus lake	150	"
acres, per minute	150	"

Total, 790 1400

Besides these, would be taken in several small spring brooks; and it should be understood that these calculations were made at the driest part of an unusually dry season. It is the opinion of respectable, observing men, that these same lakes and streams have usually afforded more than double the quantity herein stated, during whole seasons in succession; and that these lakes might be made into reservoirs of more than double their present capacity, by erecting dams across their outlets of moderate height, and comparatively at a trifling expense, which would insure a supply of water on the summit adequate to the demands of extensive commercial operations.

The lockage on the Batavia and Olean canal is as follows:

From Cattaraugus lake northerly to the Erie canal	1,135.84 feet.
From Lime lake southerly to the Alleghany river	233.63 "

Total amt. lockage, rise and fall, 1,369.47 feet.

It is proper here to state the lockage on the Rochester and Olean canal, by the Oil creek summit, viz.:

Total lockage north from Oil creek summit to Erie canal	981 feet
Total lockage south from Oil creek summit to Alleghany river	78.79 "

Total amount of lockage, rise and fall, on this route 1,059.79 "

Difference of lockage between the two routes 309.63 "

The principal feeder for the Oil creek summit from the west is the Ischua creek, which can be taken out for that purpose at the foot of Farwell's mill race, three miles and twenty-four chains above the mouth of Oil creek, viz.: Ischua, at Farwell's mill, feet per minute, 750 Lime lake, and Beaver and Fish lakes, which can be turned into the Ischua, 400

	1150
Oil creek, near the summit, say	150
	1300

Having viewed Oil creek summit as a remarkable depression across the country, and very favorable for a canal, the following examinations were made with a view to that object. The Alleghany river at Olean is 2 chains 50 links wide, and moves at the rate of 100 feet per minute, at an average depth of $\frac{2}{3}$ foot, and sends forward 12,236 cubic feet of water per minute. Its total descent from Olean to Pittsburgh is 650 feet, and the distance 280 miles; and in order to a better knowledge of this fine river, a level was carried up the river 8 miles to Rea's mills near the Pennsylvania line, and in that distance the surface of the river had risen 17 feet. About half a mile below Rea's, the Oswego fork of the Alleghany comes in from the east: this fine stream has a swift current, and sends out 2,500 cubic feet of water per minute. I had hoped that this stream might be brought to the Oil creek summit by extending the summit to the vicinity of Olean; and this I believe to be practicable, provided the Oswego could be taken out a few miles south of the Pennsylvania line. This feeder made navigable would lead into the region of stone coal.

A canal uniting with the Alleghany river by either of the above routes, would accommo-

date a large section of our country, whose surplus products are equal in quantity and quality to those of any portion of the state in proportion to its cultivated land and population, in both which respects it is rapidly increasing. These are primary advantages to a large portion of our citizens, but with the state, other considerations are to be considered; as the great enhancement in the value of the state lands, which are known to abound in lumber of the best quality, and coal mines and other minerals, which are known to abound on the various branches of the Allegany, and the very extensive commerce which would be drawn through this canal, and down the Allegany and the Ohio, and from the countries adjacent.

With all these advantages, this canal would undoubtedly soon become a source of increasing revenue to this state.

All which is very respectfully submitted.

NATHAN S. ROBERTS, Engineer.

Lenox, Madison co. N. Y. }
18th January, 1826. }

NEW STEAMBOAT.—We copy from the "Troy Budget" an account of another invention, which report says will supersede Mr. Burden's. We have sent to the inventor, requesting him to furnish drawings and descriptions of his plans, and hope shortly to be able to lay them before our readers. It consists, we understand, of two boats, and a third may be added—300 feet long, and decked over their whole length. Each boat, in shape and mould very much like the Indian bark canoe, is firmly secured by arches attached to the bottom and passing up through the deck, about 20 feet high in the centre, extending nearly the whole length of the boat. The appearance of the boat is pleasing, and is acknowledged by competent practical scientific judges to be far superior to any thing yet in the shape of a steamboat. Mr. Langdon intends to finish the boat in a superior style, with two cabins of 200 feet each, dispensing with the promenade deck and every thing necessary for its support. On the main deck, the only one required, he also intends to have two horizontal engines, one each end of the shafts, the cranks being placed at right angles. The boiler will be constructed like the one which is in operation at the steam-engine works of Langdon, Grosbeck & Co., West Troy, for burning anthracite coal. The boiler is very economical in its consumption of fuel, and is a rapid generator of steam. Mr. L. is of opinion that one firing will be sufficient to carry his boat from Troy to New-York. We have seen the boiler, and it certainly appears, like the boat, to be superior to every thing of the kind in the country.

The boat is an interesting and ingenious specimen of mechanism—combining great strength and durability with a spacious deck and extensive cabins. Its buoyancy and dimensions, united with the perfect safety attending it, together with the superior accommodations which can be furnished, when put in operation, will bring about a new era in the history of travelling by steam. Mr. L. has secured a patent, and intends to have his boat in readiness for use in the course of the next summer.

Mr. Langdon is not unknown to the public as a worthy and skilful mechanic. He is the inventor of the Horse Ferry Boat, which has come into very general use. We wish him the completest success in his new enterprise.

Prize Medals to be awarded, for Discoveries in Science, by the Royal Society of London.
[From the Journal of the Franklin Institute.]

GENTLEMEN,—I am directed by the American Philosophical Society to communicate to you, for publication, the annexed letter, received at their last stated meeting. The object of the Society is to diffuse the information given in that letter throughout the scientific community in the United States.

Very respectfully, yours,

A. D. BACHE,

One of the Secretaries, Am. Philo. Soc.

Some-st House, Apartments of the Royal Society, London, Aug. 3, 1833.

SIR,—I am honored with the commands of His Royal Highness, the President of the Royal Society, to acquaint you, for the information of the American Philosophical Society, at Philadelphia, that His Majesty, the King, has been pleased to grant two gold medals of the value of £50 each, to be awarded by the Royal Society on the day of their anniversary meeting in each succeeding year, for the most important discoveries in any one principal branch of physical and mathematical knowledge.

His Majesty having graciously expressed a wish, that scientific men of all nations should be invited to afford the aid of their talents and researches, I am accordingly commanded by His Royal Highness the President to announce to you, sir, that the said Royal Medals for 1836 will be awarded in that year: the one for the most important unpublished paper on Astronomy, the other for the most important unpublished paper in Animal Physiology, which may have been communicated to the Royal Society for insertion in their Transactions, after the present date, and prior to the month of June, in the year 1836.

For the present, and the two following years, the Council of the Royal Society, with the approbation of His Majesty the King, have directed the Royal Medals to be awarded for important discoveries or series of investigations published within three years previous to the time of award; and those for the year 1833 have been adjudged, the one to Sir John F. W. Herschel, for his paper on the investigation of the Orbits of Revolving Double Stars, inserted in the fifth volume of the memoirs of the Royal Astronomical Society; the other to Professor Decandolle, for his investigations in Vegetable Physiology, as detailed in his work entitled *Physiologie Vegetale*.

I have the honor to be, Sir, your most obedient servant,
CHARLES CUNIG,
For. Sec. Roy. Soc.

To the Secretary of the American Philo. Soc., Philadel.

APPARATUS FOR OBTAINING FIRE.—A very ingenious apparatus is now exhibiting at the store of Mr. John Bailey, in Union street, for obtaining fire. It consists of two glass cylinders, the outer one of which contains a compound of sulphuric acid and water, and in the inner one, which is without a bottom, is suspended a piece of zinc. The action of the acid upon the zinc creates a gas, which is let out by means of a valve, and in coming in contact with atmospheric air, immediately ignites a piece of platina exposed to it. The apparatus is very neat, and was constructed by a young man in Mr. Bailey's employ, from a description of a similar work in Europe.—[New-Bedford Gazette.]

[GEOFFREY FAIRBANKS.]

NEW-YORK AMERICAN.

FEBRUARY 8-14, 1834.

LITERARY NOTICES.

No. XIV.

DEXTER, (*Washtenaw Co., M. T.*) Dec. 15th.

I have been waiting here since I last wrote in order to join an exploring party of three or four individuals, to go up into Shiawassee county, to examine lands. A heavy snow storm has set in to-day, however, and as it will put an end to the expedition, I shall probably start by myself for the Hologago county to-morrow. The journey to Grand River which I proposed to myself, I shall, from the time it would consume, be compelled now to abandon entirely. I do not regret the time I spent here for I am not far from the centre of the territory; and while I have my head quarters at a good tavern in a well settled place, I can, in a ride of a few miles, plunge at once into the wilderness. It is a pretty dangerous matter, however, for a stranger to go without a guide reconnoitering through a country where every hill, lake and wood, looks so much like its brother, that the ordinary landmarks are of no assistance to the eye. The scenery of Michigan will be far more attractive when cultivation shall give variety to a landscape which, however beautiful it is at present, is somewhat monotonous. After visiting nearly a dozen of the transparent ponds of every size which stud the surface of the country, and finding but two or three whose firm banks of some fifteen or twenty feet elevation, assumed a picturesque appearance, from the irregular manner in which they pushed their beautifully wooded promontories far into the lakes they bounded, I started, the other day, to visit a sheet of water somewhat elevated, about twelve miles off.—My way, after going a mile or two from the village, led through oak openings of rolling land, called "the short hills," which I can best assimilate to a collection of enormous graves—the tombs of cities, if you choose—thrown confusedly together upon a perfectly level surface—where a patch of wild meadow land—a cranberry marsh, or a bog that looked like the desolated bed of a lake, and frequently indeed the shallow lake itself, filled up the intervals. The huge oaks that crowned the summits of these formal mounds were the only objects that relieved the dreariness of the landscape—even they, I thought, while riding alone beneath their branches, that sighed to the December wind, were not the most enlivening objects in the world. I rode thus for miles, without seeing a living thing, except a raven, which, as that description of bird is only found in these parts of the Union where wolves still infest the country, I at once took it for granted was hovering near one of the savage beasts to which he so faithfully plays the Jackall. Wheeling my horse suddenly from the trail toward a thicket of dwarf oaks, where I expected to find the carion deer that attracted these worthies, he shied from the bush, and I was thrown upon the spot. After extricating the foot, by which I was dragged a yard or two, from the stirrup, I sprang up but little hurt and moved as quickly as possible to catch my horse, who, having paused for an instant in a clump of trees near by, turned his head around, like a pointer taken aback with the scent after he has passed a bush, and stood calmly gazing at me. At the first step toward the rascal, however, he moved nearly a rod sideways, and then ducking his head toward the ground, and throwing his heels high in the air, my ungrateful courser, accompanying these motions with every additional mark of disrespect he could summon to his aid, left his master alone in the wilderness. He disappeared behind a hill in a moment. I could not help ejaculating with the Kentuckian whose house and family had been burnt up by the savages while he was cleaning his rifle at a brook hard by—"This is very ridiculous." No time was to be lost however. It was late in the day and I was far from any house; while the occa-

sional flakes of snow, which began to fall from the black lowering sky, threatened a storm which might cover in a moment the only path that could guide me homeward. I sat down at once among the long dry grass, and stripping off my leggings and disembarassing my heels of the now useless spurs, stowed all away in my coat pockets. The coat itself, I rolled up in a bundle around my left arm, and taking my gun, to which I applied a fresh cap, in my right, I strode off in as good a humor as one could summon under such provoking circumstances. I could not help thinking, indeed, how much worse matters might have been had I been thus deserted in one of the broad prairie, thirty miles, perhaps, from any house. As for the loss of my horse, I felt so indignant against the inconsiderate brute, that I confess it did not much trouble me. Thus did I trudge on, growing momentarily in better humor with myself. The scene around was dreary at present, but having had all the wild flowers that grow in Michigan described to me, I exercised my imagination by conceiving the more attractive appearance it must wear in summer. I thought how the brown woods must look when the lofty oaks around were clothed in their deep green foliage. I thought of the various vines and flowers which then fill the broad opening between their stems—of the clumps of cluster roses that here grow wild and cover whole acres—of the crimson daisy and fragrant balm pink, the deep-hued lichnidia, and gorgeous golden rod, which, with jonquils and amaranth, the purple fox-glove, and saffron colored silk weed paint the surface of the soil. I could fancy the glossy leaves of the night shade, with its white blossoms and poisonous berries, the creeping ivy and red columbian clustering at the base of the hills. The snow-white lily of the valley, the lilac-tinted, adder's tongue and straw-colored arrow-head, shooting through the long grass between, while the purple fleur-de-lis bloomed along the wet marshes, and the splendid cardinal flower tossed its scarlet leaves in the breeze that swept the banks above.

I must have practised horticulture in this way for sometime, when on rising a slight eminence in my path, I saw my amiable roan standing quietly looking in the direction whence I was coming, apparently waiting for me. I was completely mollified. I forgave him the little freak and advanced with a light heart to lay my hand upon the bridle. He moved a little, and so did I. He moved a little more and I stood still. I spoke to him, but he continued moving. I coaxed him in a tone that would have melted the heart of one of the marble horses of St. Mark's. He was moved by it only further from me. I whistled to him—I had taught him a day or two before to come to my whistle, when he had obeyed me like a dog—he stopped, and I advanced once more to lay my hand on the saddle, and the scoundrel broke into a trot just as I was about touching him. I brought my piece to my shoulder, and could hardly forbear drawing the trigger upon him as I stood.

The ground now rolled like the waves of a frozen sea, and my nefarious brute, who soon began to stalk leisurely along about a hundred yards ahead of me, would, to carry out the figure, be just topping the combing while I was in the trough, and vice versa—like two children balancing on a plank. It was perfectly insufferable, mile after mile, to see that eternal saddle bobbing up and down a hundred yards ahead of me. Sometimes, indeed, the vexatious wearer would step aside among a cluster of oaks tenip the tender grass which still lingered around their roots, and then as he would arch his neck, and seeming to admire the Indian blanket and flame colored surcingle which, after the gay taste of the west, I had buckled, combining use with ornament, to the back of the ungrateful brute, dash off with a snort into a patch of prairie land, I could not but admire the eye of fire and gracefully-gathering-limbs of the spirited creature. I wished, however, that he was anybody's horse but mine, disporting himself at that rate. Besides he was a Kentucky horse, and what right had he to run thus wild in Michigan. At last at a turning of the path he disappeared behind a hill, and ceasing longer to tantalize, left me comparatively comfortable. I reached the first "clearing" about 20 minutes afterward, and looking along the highway which here commenced, my steed was nowhere to be seen. Tire I awoke with walking and vexation, and parched with thirst, (I had neither eat nor drank since breakfast, and it was now nightfall) I advanced to the only shantee near, and knocked at the door. There was no answer, and I shook it violently. A rush-bottomed chair rattled and a cat, the solitary occupant, sprang out through a broken window. I soon found my way, however, to the dilapidated trunk of a large sycamore tree near, which formed the top of a well, and draw-

ing up a moss-covered bucket I placed my lips to the rusty iron-bound brim and took a draught to which the most delicious of Lynch's chateau were but vile *vin-du-pays* in comparison. I can remember but one drink in my life before to compare with it, and that was from a similar goblet after other lips than mine had hallowed the brim. A few moments after a lad rode into the yard with the object of my pursuit, whose bridle had been broken to pieces in the effort of several men to catch him a mile or two off. I was mounted in a moment, and regained my lodgings in an hour, when I found that the adventure of the day had not impaired my relish for a supper of fresh pike and white-fish just smoking on the table.

The range of hills which traverse the Peninsula longitudinally near here, though never, I believe, more than 200 feet high, are said by some to constitute the most elevated part of Michigan. As they abound in game and consist altogether of oak openings, you can conceive of nothing more animating than to gallop over them on horseback. I was out again among them yesterday; and having a pocket compass with me and a map of the country in my pocket, I ventured to leave the trails that wind among the hollows, and scamper over the hills, as my fancy led me. A large flock of grouse rose almost from beneath my horse's feet as I topped the first slight eminence, and then just as the animal was recovering from the flurry into which the rushing sound of their wings threw him, a tall broad-antlered buck, the largest I ever saw, sprang from a small covert, and bounded through the wide forest glades. Away too I went—the feeling was irresistible—I could see the fellow leaping as if he had wings over the rolling land, and the clear bracing atmosphere had given spirits to my horse, that sent us ahead like one and the same animal. In spite of the deer's prodigious jumps, which were as high as they were long, I had gained decidedly on the chase, when coming to the brow of a steep hill, he dashed down the side, and was far away over another before my less agile horse could descend the first. I saw two more deer, besides several flocks of grouse, during my morning's ride. Singularly enough, this was the only time that I had moved a mile without a gun since I left New York; and it was the only opportunity I have had to use one to advantage. If Der Freyschütz were in this region, I should certainly have let the wild huntsman make his own terms with me for better luck.

To-day, for the first time, I saw the meadows on fire. They are of vast extent, running far into the woods like the friths of a lake; and as the wild grass which they supply in the greatest profusion, furnishes the new settler with all the hay he uses for his stock, they are burnt over thus annually to make it tender. These fires, travelling far over the country, seize upon the large prairies, and consuming every tree in the woods except the hardiest, cause the often-mentioned oak openings, so characteristic of Michigan scenery. It is a beautiful sight to see the fire shooting in every direction over these broad expanses of land, which are kindled at a variety of points. The flame at one moment curls along the ground, and seems to lick up its fuel from below, while at the next it tumbles over like the breakers of the sea upon the dried grass, and sweeps it in a wave of fire from the ground. I found myself repeatedly surrounded by the fire, while riding hither and thither, watching its progress; but was only on two occasions exposed to any inconvenience—once when my horse was bogged to the saddle girths, so that I had to dismount, in a morass, covered with high weeds, to which the flame was approaching, and again when I found myself in a patch of small woodland, which crackled and roared like tophet itself.

As I rode to and fro here, with a young gentleman in company, trying to find a point where, if necessary, we might encounter the flame to less disadvantage, if unable to avoid it altogether, the ridiculous position in which we had placed ourselves, reminded me not a little of that which Andrew Fairservice occupied on the rock, when he trotted hither and thither on his narrow platform, to avoid the bullets of Rob Roy's Caterans. A finer subject for reflection, however, presented itself near the spot. A small brook crossed the meadow, and my companion dismounting, led his horse through, and gained the other side in a moment. But mine, when I rode him rapidly to the brink, and endeavored to jump him, recoiled. I wheeled round, and tried it again; but his recent experience in the treacherous marsh made him fear the sedge brink, and nothing could prevail upon the cautious animal to approach it. At the last attempt, he recoiled so

suddenly with a terrified snort, that I was nearly thrown over his head; and looking for the new cause of anxiety where the stream wound around, so as almost to double itself in front of me, I saw, on the little peninsula of the burning meadow thus formed, an Indian standing with folded arms amid the wreathing smoke, and surveying my motions with an aspect of perfect calmness. He was a middle-aged man, rather tall, and in the full costume of his tribe. The hair on his forehead, which was seamed with several ghastly scars, was nearly white, but three long plaited locks of raven black fell down behind from the crimson handkerchief which bound his brows. He wore a white woollen frock edged with black, with scarlet leggings and moccasins, while armlets of silver and a belt containing his tomahawk and scalping-knife completed his equipments. All these, however, were observed afterwards, when I had given up the attempt to cross the brook, and spurring through the flames where it was lowest, placed myself by the side of the old warrior. But for the present I remained fixed in my seat, gazing on the noble apparition with as much delight as if my own call had evoked it from the ground. I had seen a dozen Indians of all sizes and sexes in the course of the day, not one of whom had awakened the slightest interest; but there was that about the port and bearing of this grim-looking savage, which, with the somewhat theatrical attitude he assumed and the circumstances under which I first beheld him, carried me away completely. He smiled when I approached him, and received me with great kindness of manner; though, as neither of us understood the language of the other, there could be but little interchange of ideas between us. The few Indian expressions of which I am master, were soon expended, and he seemed not to have a word of English to give me in exchange. He made my companion understand, however, that the frightful wounds which disfigure his noble front, were received while fighting on the side of the British against the Americans at Sandusky.

The name of this veteran chief I have since learned to be *Okemaus*, and I find that he is well known and quite respected in the neighborhood.

GRASS LAKE, JACKSON CO. (M. T.) Dec. 16.

The storm of yesterday still prevailed when I left my excellent quarters at the growing little hamlet of Dexter, to find my way toward the country watered by the beautiful *Kalamazoo*. I had been furnished by mine host with a map of the route for the first eight or ten miles, and it would have amused you to see me occasionally stopping in a furious snow storm to balance my pocket compass on the hasty chart thus supplied. I found my way, however, with very little difficulty through a very thick wood, when the thick coat of snow that robed the trees gave a most fantastic appearance to the forest, and about noon I struck the Washtenaw trail to the west. The travelling, however, was anything but agreeable. The snow being soft would "ball," as it is called, beneath my horse's feet, and what with the stumbling and slipping on this account, I have been unable after a day's travel to make more than twenty miles. There was barely light enough left for me to distinguish my way, when I arrived at a comfortable log house belonging to an intelligent and hospitable farmer, a recent emigrant from the western part of the State of New York. The owner of the dwelling was absent, and it was not till after a parley of some minutes between two very pretty women, whom I could distinguish through the window by the light of a tempting-looking fire within, that I gained admittance to pass the night. Once there, however, nothing can exceed the kindness of the family to make the few hours I shall pass with them agreeable.

SPRING ARBOR, DEC. 17.

The snow still continues, and the road, becoming worse and worse, I have made even less progress to-day. But there is something so wild and picturesque in the country through which I am passing, that even such travelling has its pleasures. I have counted more than a dozen lakes on my route, and though some of them are only dreary-looking pools, covering a few acres, in the midst of an extensive moss marsh, yet the short sudden hills which surround others, with the beautiful groves of white oak on their banks, and the natural meadows that open upon their mimic friths, make a most romantic appearance. I came unexpectedly upon a travelling band of Ottawas this morning, in one of the most abrupt of these passes. They were returning home partly equipped with presents from the recent treaty held on the Wabash, and their fluttering blankets, gleaming weapons, and gaudy equipments generally,

would have made them a fine subject for a painter, as a furious squall of snow swept along the side-hill they were descending. We exchanged the customary salutation, "Bojour," (probably from the French *bonjour*), and passed on.

There are several Indian graves immediately before the door of the shantee where I am stopping for the night, which I am told are regularly visited and weeded by the surviving relatives of those here buried. My host has had the good taste to put a fence around them to keep his cattle from the spot—a piece of attention with which the Indians appeared to be much gratified at their last visit; and I may here observe that the settlers of Michigan generally appear to treat this ill-fated race with a degree of kindness and consideration that might well be imitated on other sections of our frontier. This morning I crossed the far-flowing Washtenough (or Grand River) near the new village of Jacksonburg; and the sight of its clear smooth waters inspired a new regret that I must abandon my original intention of following them down to the last trading post.

FORKS OF THE HEKALAMAZOO, {
(Calhoun) Dec. 18.

This never ending storm still continues, and the trails, where not incessantly travelled, being now completely covered and effaced, I lost my way this morning, and wandered several miles from the track. After traversing a broad marsh, however, where my sagacious horse seemed loth enough to venture, I struck a burr-oak opening, and found my way, by the blazed* trees back to the main trail. A man who is used to it, I am told, can get along very well in this way; but you can imagine, that where one has frequently to cross openings of some two or three hundred yards in width, and then hunt up these primitive guide posts, which only occur at long intervals, and have their slice of bark taken out at either side, it is not quite so easy to find his way here, especially with the snow blowing full in his face, as if walking through the rectangular streets of Philadelphia. It took me three hours to gain six miles in this way, my horse slipping and flouncing at almost every step. But lost as I was, I could not help pausing frequently when I struck the first burr-oak opening I had ever seen, to admire its novel beauty. It looked more like a pear orchard than any thing else to which I can assimilate it—the trees being somewhat of the shape and size of full grown pear trees, and standing at regular intervals apart from each other on the firm level soil, as if planted by some gardener. Here, too, I first saw deer in herds; and half frozen and weary as I was, the sight of those spirited looking creatures sweeping in troops through these interminable groves, where my eye could follow them for miles over the smooth snowy plain, actually warmed and invigorated me, and I could hardly refrain from putting the rowels into my tired horse, and launching after the noble game. What a country this is. Into land like this, which is comparatively undervalued by those seeking to settle on the prairie, a man can run his plough without felling a tree, and, planting a hundred acres where he could clear but ten in the unsettled districts of New York, raise his 25 bushels of wheat to an acre in the very first season. "How is the soil here, Sir," said I to a farmer whose broad fields, though but a year under cultivation, looked as if they had been tilled for ten. "A pretty good gravelly loam of 18 inches; but I think some of moving off to Kalamazoo, where they have it four feet deep, and so fat that it will grease your fingers." Railroads and canals will make one broad garden of Michigan, and even now, there is something singularly pleasing to light upon spots in the wildest districts, which, were it not for the rude shantees which indicate their recent settlement—often of but a few months back—might be mistaken for the cultivated farms of an old country. The absence of stumps in the land under cultivation, and the open groves adjacent, give a smiling openness to the landscape which, with the myriads of wild flowers that here deepen the woods in their season, must make the aspect of the country perfectly delightful. I hardly know, though, how some of your city *élégants*, the votaries of Delmonico, or the fair visitants at Gardiner's, would meet the inconveniences of travelling here. As for eating, indeed, they might manage with the aid of cranberry sauce to rough it on venison and wild honey, backed by the finest potatoes and best wheat bread in the world; but I think that when it comes to sleeping, they would be somewhat pained between a bed in the bush and one shared with the hospitable inmates of a cabin, whose dormitory for the whole family is often, as well as their kitchen

* "Blazed" trees are marked with an axe or hatchet, to designate that a trail runs near them.

and parlor, comprised in a single room. Were it not an infraction of the second law of hospitality, I could draw some queer pictures of scenes I have witnessed in this way.

I have now passed the central region where the Eastern and Western rivers of Michigan have their rise, and while I follow down the pebbly waters of the beautiful Kalamazoo to their western outlet, and from thence pass to the mouth of the St. Joseph's, you must not expect the same regularity in my correspondence I have hitherto attempted to preserve. I am well.

MANLY PIETY ON ITS PRINCIPLES, by ROBERT PHILIPS, of Maberly Chapel. New York, JOHN WILEY. A book on religious duties, which, like this, has the merit of being exempt from all cant, and which presents religion in an aspect that is attractive, and with tolerant views, cannot but do good. The manner of the writer is earnest and forcible, and his matter that which concerns all.

SELECT WORKS OF JAMES SHERIDAN KNOWLES, 2 vols. Boston, CARTER, HENDREE & Co., and ALLEN & TICKNOR.—The acting of MacCready, of C. Kean, of Forrest, and above all of Charles Kemble and his tragic daughter, have made the tragedies of Sheridan Knowles familiar to our theatrical public. *Virgilius*, *William Tell*, the *Hunchback*, and *The Wife of Mantua*, are all appreciated here. These, with other of his dramas, and some of his excellent prose tales, together with a brief memoir of his life, make up the contents of these two little volumes, which are quite an agreeable addition to current literature.

THE AMERICAN TURF REGISTER, &c. for February. Baltimore: J. S. SKINNER.—With much of the usual interest in this number for the amusement and information of sportsmen, there is in one of the papers a somewhat higher and more serious tone of philosophizing, if so we may call it, than is usual in discussing the breed of horses and dogs. We give an extract from this paper. It is to rebut the notion that because we have good horses in America, it is not worth while to seek to improve them by importations from abroad.

Change the name and the object, and the truth and justness of these remarks are of general applicability.

But I must notice an argument on account of its commonness—if argument that can be called which is a feeling, and not a reason; an argument which, springing out of our pride and prejudice, makes us put a high estimate on ourselves and our things, and a low estimate on other persons and things, and disdains to acknowledge that the growth of America is inferior to the growth of any foreign clime. Our people have a national conceit,—a public egotism,—which makes us exalt ourselves at the expense of others. Say anything is *American*, and it is stamped at once with a nationality, which confers on it undoubted excellence and indisputable superiority. Hence it is that we hear the performances on the English turf denounced as fables, altogether unworthy of credit. As in higher and more important matters, so in matters of the turf, this wide-spread and rapacious feeling prevents us from imagining any thing superior to the feats of our own horses, and flatly denies that the superior means and facilities of England have produced their natural and correspondent effect. It would be as well to deny the existence of Shakespeare and Sir Walter Scott, because no one amongst us has yet rivalled "the Bard of Avon" and "the Great Unknown." It would be as well to deny the existence of Ruthchild, because we have no banker who can control the operations of the most potent governments. We might as well deny the existence of London, the "modern Babylon," with her million and a half of people; or the magnificent system of English pauperism, which tells of two million recipients of public charity. The fact is, and it cannot be disguised, that England is in advance of us in many respects. She is in advance of us in age and power, and wealth and luxury, and corruption—in philosophy, poetry and eloquence—in manufactures, agriculture and commerce—in her military and marine resources—in her towns and internal improvements—in her public debt and public burdens. She is in advance

of us in the pleasures of life, yet farther than its business: in her theatres and shows—her amusements and sports—her boxing and cock fighting—her dog coursing and horse racing. It is true that we already rival her in many things, and surpass her in some; and as our country gets older and richer, and our citizens enjoy means equal to hers in all respects, there can be no doubt that, whether "for weal or for woe," we can fearlessly stand beside her in every thing. The time will come when the impartial scales of justice will award to us what our national vanity would prematurely snatch, and we can safely challenge a comparison with our mother country in all the employments and pleasures of life, and the consequences incident to them. The time will come when we shall have our poets and our paupers—our wise men and our woolen factories—our towns with a million of people, and our bankers with their millions of money. And, in relation particularly to our subject, we may safely assert, that the time will come when we shall manage things with more system and greater skill—when we shall have a better stock and better racing—when the performances of our horses will justly vie with the boasted feats of the English Eclipse, Highflyer and Priam.

A MONTH LATER FROM ENGLAND.—The ship United States, of the 13th Dec., and the ship Napoleon, of 24th Dec., from Liverpool, both arrived last week, giving us from England accounts one month later than previously received.

The British Parliament, which stood prorogued to the 12th December, was, by royal proclamation of 9th December, still further prorogued till the 4th of February.

The French Chamber of Deputies were to assemble on the 23d December.

The packet ship North America, which sailed hence on the 1st December, arrived out on the 23d.

The U. S. Schooner Shark sailed from Lisbon for Gibraltar Dec. 12th.

The Paris papers state that the Duke of Orleans will set sail for America in March next, and that he intends to pass the greater part of the year in visiting different parts of that country.

BEARHAVEN, Dec. 9.—"The Orpheus, Glover, from Charleston for Liverpool, having been got off the rock, proceeded yesterday, and has put into Bantry Bay."

"The American vessel wrecked at Berck, near Boulogne, the 2d December, is the Dorothea, from New York to Rotterdam. Crew saved."

The most important intelligence, at this moment, to our community, indeed to the whole country, is a considerable and unanticipated improvement in the price of the great staple of Cotton.

Some apprehension existed, we learn, that American Stocks sent to England for sale, might, with the bills drawn against them, be returned by these packets. Nothing of the sort, however, has occurred.

LONDON, Dec. 21.—The Consol-market, after a very long period of stagnation, has experienced an advance to day, to no very material extent. The cause assigned for it is a remarkable one, since it is given out to be the determination of the Bank to lend a sum of £2,000,000 on stock. According to another account, however, this is not to be done with money the property *bona fide* of the Bank of England, but with funds held in deposit belonging to the East India Company, for which corporation the Bank is to act in the affair solely as agent. All the reports agree, however, in stating that such a sum, at present lying idle, is about to be employed for such a purpose. Still the question naturally presents itself, why the bank should become an agent at all in such a manner, and why the same could not be done in a direct way by the East India Company? To the monied interest at large the effect will, perhaps, be the same, since there is as much an increase of the issue of notes in one way as in the other; but it is a very different thing with the public which of the two corporate bodies is to appear in and to have the management of it. The whole sum is said to be engaged on the part of one leading capitalist. These consequences will be felt, if the fact is correct, in every description of stock, and of commodities, too, for such a sum cannot, it is obvious, be brought suddenly into a market already well supplied, without producing a sensible effect. Some say that this is already perceptible, and that a renewal of the demand

for produce is beginning to take place. The speculators are evidently on the alert, and if due precaution is not taken, will repeat the process which took place in the spring, by coming in at the lowest prices, and selling at the highest, leave their dupes to bear the brunt of the reaction sure to follow, and to lament over their losses. In whatever stage of its progress the affair may be, the warning cannot but be salutary.

In political matters the most interesting is that which concerns the growing difficulties between England and France on the one side, and Russia on the other, ostensibly, respecting the navigation of the Black Sea, but in truth, because of the design becoming more and more manifest of Russia to possess herself gradually, but surely, of the magnificent ruins of the Turkish Empire in Europe.

It is said that the partition of Turkey was resolved upon at the late conference at Munchengrätz; that Russia and Austria are to be the active agents in the affair; while Prussia will keep France in check on the Rhine. A correspondent of the Times says—

"The scheme of Joseph II. and Catherine II. as concocted prior to 1790, is about to be realized. The death of Mahmoud is to be the signal; and that event is hourly predicted by his own subjects, who detest him, and who hate the Russians more, in consequence of their having come to support him. It is even affirmed that the treaty of partition was signed between the despoilers at their late meeting in Silesia.

"The period for the great effort on the part of Russia is at hand: alone the prey may escape her grasp; Austria is therefore invited, as in the case of Poland, to take a share. The cautious proceedings so long adopted by the Cabinet of the Kremlin, of moving step by step and securing every position, must soon be abandoned; and Russia and Austria, no longer acting as foes, are resolved with the speed of vultures to devour the spoil. In France, the want is felt of a great military leader who could counteract this project by a bold display of power. England is compelled, for self-defence, to prevent the aggrandizement of Russia by aiding France. One step on the part of any statesman may, on the death of Mahmoud, involve Turkey, and light the blaze of war in Italy and along the line of the Rhine."

It does not appear what authority the writer possesses for these assertions. The facts, however, which he states, and the consequence anticipated from them, are sufficiently plausible.

By an article we copy from the Times, it will be perceived that both France and England are sensibly increasing their naval force afloat, and the only plausible explanation of these preparations seems to be, that of holding in check, or if necessary, acting offensively against, Russia, in the Mediterranean and Black Sea.

England, France, and Russia.—The naval preparations of Russia and France have for some considerable period attracted the notice of political observers in every part of Europe. The French Government has been pushing forward a powerful armament of men of war in her southern dock yards, to be accompanied by 20,000 or 30,000 troops for the purpose, as it is announced, of invading the African province of Constantina, a dependency of the former Government of Algiers. Perhaps a more pressing service might be discovered a few hundred miles to the eastward of that new French colony. Russia has a fleet in the Euxine, within three short days' sail of Constantinople, consisting of not less than from 22 to 24 ships of the line. Can any one be surprised that the Government of Louis Philippe should hasten to be in readiness for all contingencies, or that England should participate in just apprehension of the manifest design of Russia? That England does share the feelings of France on that important subject seems plain from the fact, made known by all the newspapers, that our Admiralty have within these few weeks given orders to fit for immediate service several men of war and first class frigates, now lying in ordinary at Plymouth, Portsmouth, and Chatham, eight sail of the line, we believe and four or five frigates, which, with the Victory and two others already in commission at Plymouth, would constitute a force of 11 sail of the line; and, added to the squadron already in the Archipelago, would compose a fleet of some 16 or 18 sail of the line, including half a dozen three-deckers. Any longer indifference on the part of England to the progress of Russian conspiracy and

trickery against the magnificent ruins of the Turkish empire, would be an insult to the honour of this great people, a sacrifice of the security of British commerce, and of the freedom of the Mediterranean, as well as a crime against the independence and tranquility of the European Continent. We rejoice, therefore to learn from our brother journalists, that signs of increased alacrity to meet, or, in other words, to ward off, the evil which threatens us, are visible in the preparatory measures of his Majesty's Government. If the Cabinet of St. Petersburg shall be satisfied that France and England really "mean what they say," and that they rig out and man a formidable fleet, nor for ostentation, but, if unavoidable, for action, it is our belief that the Czar will turn more than once on his pillow before he dares the encounter of such a confederacy.—[Times.]

[From the Liverpool Standard.]

With respect to the affairs in the East, the ministry of England are unfortunately in this position, viz., they must either consent to surrender their rights of trade and navigation in the Black Sea to the Russians—either be content to be excluded from the Euxine—be content never to pass the Dardanelles except with the approbation of, or bearing a passport from, the Emperor—or they must go to war.

CONSTANTINOPLE, [Nov. 11.—Another fire broke out in the night of the 3d inst. which was soon extinguished, but it affords the melancholy proof that incendiaries are still at work. Letters from Alexandria of the 4th inst. announce that Mehemet Ali has commissioned four banking houses to pay five millions of piastres (500,000 florins conventional money) to the Porte. This is only one year's tribute due from the Pacha of Egypt. It is well known, however, that there is still another year in arrear, as well as the tribute of the newly acquired provinces (20 millions piastres per year) of which two years are due, which Mehemet Ali refuses to pay. It is not known for which of these two accounts the sum now paid is intended; many conjectures are formed on the subject. We have no news from Candia; opposition to the Porte increases in Samos, and the opinion is that it is stirred up by foreign emissaries.

PARIS, Dec. 16.—The following is from the Indicateur of Bordeaux of the 11th instant, received by express. "The entrance of Spanish troops upon the Portuguese Territory, is confirmed by news which has reached us from the head-quarters of General Morillo. This officer would not have set foot thereon but to pursue Don Carlos, who, after two months' hesitation, has considered that his royal dignity required him to appear upon the soil where the rights of Queen Isabella and his own are in conflict. This display of monarchical courage was not of duration. Only 30 men of his suite were able to save themselves; and on the 29th the Prince was at Elvas, where without doubt, he will take rest after his fatigues, but, where either the troops of Don Pedro or those of Isabella will go and dislodge him."

LONDON Dec. 23.—We last night received the Paris Papers of Thursday, together with all those of Friday and of Saturday's date. They are chiefly occupied with speculations and rumours but they add little to our positive knowledge as to the state of affairs in these parts of Europe which chiefly commanded attention at the present moment. As to Russia, the tone of the Journals following in the track of our own is sufficiently warlike, but it is supposed that, whatever may be the issue of the present demonstrations, a better understanding prevails for the moment between the Cabinets of the Tuileries and St. Petersburg. The accounts from Spain relate chiefly to the movements of troops and rumours of various kinds.

It would appear that the Queen's cause is not so triumphant as her partisans would have the world to believe. Valencia is stated to have declared against it, but the same paper (the *Memorial Bordelais* of the 17th) contains a letter from Madrid, announcing the advance of 44 millions by the commercial body to supply the wants of the Government. Nothing, however, of a decisive nature is to be inferred from those conflicting accounts.

Paris itself remained tolerably tranquil. Several of the medical students arrested on Tuesday were still in custody.

From Spain and Portugal we have direct accounts, later than those received by the packets. Details however, are supplied by them, of some interest.

The London Spectator thus speaks of the condition of the internal affairs of both these countries.

The report of the dismissal of M. Cruz, the War Minister at Madrid, is confirmed: but Zea Bermudez still retains his post. M. Zarco del Valle, a

decided Liberal, and friend of the Marquis De las Amrillas, is appointed to the War department *ad interim*; and there seems to be no doubt that the interest of the Liberals in the Queen's councils has lately been much strengthened. Great efforts have been made to procure the removal of Zea Bermudez, by Count Florida Blanca; who has addressed a strong Anti-Ministerial letter to the Queen; but the Minister has hitherto possessed the firm support of M. Rayneval, the French Ambassador; and until that fails him, it is believed his place will be tolerably secure.

Saarsfield has resigned the immediate command of the army to General Valdez, and is appointed Vice Roy of Navarre. It seems that his long, and apparently unaccountable inaction at Burgos, was owing to want of vigor, or perhaps to treachery, in the late Minister of War, Cruz; by whom he was left unsupplied with the necessary reinforcements, and hampered with contradictory orders. The vigorous representations of the Liberals, and the growing dissatisfaction in the capital, at length compelled the Queen to interfere.—Saarsfield sent in his resignation of the command; but first insisted upon putting a virtual end to the war by the capture of Vittoria and Bilbao.

The accounts from Portugal are unsatisfactory to all who wish for a speedy termination of the contest. Don Pedro gains no ground in the interior, and succeeds principally in disgusting his daughter's best friends in the capital. M. Carvalho, his Prime Minister is hated as heartily as his master; but, in his position, what Minister, could be popular for a month together.

Miguel has lately increased his force at Santarem, by recruits; and the arrival of a detachment of 3,000 men from his army, before Oporto, has enabled him once more to assume the offensive. He has dispatched troops into the Alentejo, with the intention it was supposed, of attacking Faro and Lagos in the Algarve.

The latter place had been supplied with provisions and a few soldiers by Napier; who was, however, unable to reach Faro, in consequence of a storm at sea.

MADRID, Dec. 10.—The news of the taking of Morrell is confirmed. According to the rumors of the day, the castle was taken by assault, after an obstinate resistance, in which we lost many officers and men. The insurgents, it is added, were nearly all put to the sword.

LIVERPOOL, Dec. 10.—The principal news from Portugal relates to a mission of Col. Hare to Don Miguel at Santarem. This gentleman is a sort of deputy negotiator on the part of the British Government, and there can be no doubt that he has gone to sound Miguel as to the possibility of putting an end to the wretched war, or rather *raid*, which is wasting the resources of Portugal.

It appears (says the Liverpool Chronicle,) that the offence of Taipa is the publication of a letter to Pedro, in which he denounced the proceedings of the Ecclesiastical Commission for the suppression of Religious Houses. The letter was couched in strong language, and applied the terms "Pope," and "Profane Counsellor" to the President of the Court. This led to his being represented as an agent of Miguel, and a warrant was immediately issued for his apprehension. The Peers are more enraged than ever at the terms of the ministerial reply to their address, and when the Ann Paley sailed, they were met for the purpose of preparing a still more urgent remonstrance.

GALE.—A severe gale was experienced on the coast of England, Nov. 30th, the wind blowing from W. N. W. Several vessels were lost, and many others damaged.

Dreadful Shipwreck.

LIVERPOOL, Dec. 21.—On Sunday last, Messrs. Watson and Pim, the owners of the Lord Blayney sent out a steamboat to examine the banks and shore near which she was lost, and if possible to pick up part of the wreck. Not a single article of any kind could be found, and the steamer returned into port without having gained the least information as to the causes or circumstances of the disaster. The manifest of the vessel has since been received from Newry, and it furnishes more particular information as to the number of passengers, and the amount of

property on board. The number of individuals on board, including those who belong to the vessel was FORTY-SEVEN; the names and descriptions are as follows:—Capt. Stewart, R. N. commander; Stephen Roberts, chief mate; James Smith, second mate; Wm. Darlington, first engineer, (body found); Matthew Stanton, second engineer; Mark Quilleash steward, T. Tobin, cook. The remainder of the hands are not given, as their names are uncertain. The only cabin passenger known to have been on board was Mrs. Robert Purdon, of Newry; only one deck ticket was issued—to Mr. Polin, body found. There was a person named James Gordon, with a man servant on board, and a race-horse called Mounteagle, valued at £300, which was lost. The names of the other passengers, who were dealers in pigs, are as follows:—O'Hear, P. M'Coy, P. Hanlon, P. O'Hear, and another, D. Gorman, H. Dun, James Cassidy, O'Kenry, P. Trainor, O'Rice, J. Duffy, M'Larkins, P. Rice, H. Hughes, Conisky, P. Clarke, J. Quigly, P. Evers, J. Sloan, M'Anulty, P. Dunn, Fennan, Hanlon, W. Sommerville, M'Ardle, (uncertain.)

[From the Baltimore American.]

A letter from Captain VOORHEES, of the United States ship John Adams, dated at Liberia, D. C. 14, and giving a favorable account of the condition of the American Colony, has been published in the National Intelligencer. It is furnished for publication by the Secretary of the Colonization Society, to whom it had been transmitted by Secretary Woodbury as a valuable testimony to the flourishing condition of the settlement. All seemed to be employed—good order and morality prevailing throughout. Several stone warehouses and stone wharves line the banks of the river; others are building, which, with several schooners loading and unloading, or repairing, afford an aspect and an air of business common to a respectable white population. The town is in a thriving condition, and wears an air of neatness and comfort in the dwellings which is quite surprising. Capt. Voorhees adds: "The settlement must move onward, and with all its disadvantages, it appears a miracle that it should be in such a state of advancement."

The vessels at the place, during the last year, were about ninety. An incident is related in the letter, which, while it reflects credit on the humanity and disinterestedness of the colonists, affords a strong corroboration of the importance of the settlement as a place of refuge on the coast for distressed and shipwrecked Europeans. A French oil ship was lately cast away at the coast of Grand Bassa, and the crew, twenty in number, reached that place in distress. They were kindly received by the settlers, and travelled safely along the sea shore to Monrovia. There the colonists with generous hospitality fitted out an expedition, at their own expense, and despatched the government schooner to carry the sailors to their own settlement at Goree. This generosity was the more praiseworthy because the voyage of this vessel on the errand of humanity prevented the Colonists from procuring their requisite supply of rice, and for the want of which they suffered. On the arrival of the John Adams, a French man-of-war barque was in port, which had been despatched by the Governor of Goree to express the gratitude of his countrymen to the people of Liberia for their charitable services.

HOME INTELLIGENCE.

We are requested to state, that the Delaware is again free from ice. The steam boat Burlington, of the Rail Road Line, came up from Philadelphia to Bordertown yesterday, making now an uninterrupted communication between this city and Baltimore, at Summer prices.

SHIPWRECK.—The brig *Anna Margaret*, of and from Charleston, S. C. to Havana, was totally lost on Abaco on the 15th ult. Officers and crew saved.

A VALUABLE DOG, belonging to a gentleman of Gettysburgh, Pa. a few days since, fell into a well which was fifteen feet deep to the water. A rope was thrown to him, which he immediately seized with his mouth, and held on, until he was hoisted to the top in safety.—[Phila. Daily Adv.]

Appointments by the Governor and Senate, February 5, 1834.

New York.—Isaac Adriance, John G. Atterbury, Timothy P. Bruger, John Boyd, William H. Bogardus, Isaac O. Barker, John T. Barten, Horton H. Bur-

lock, Franklin Brown, Abner Benedict, William H. Bulkley, Henry L. Clarke, Philip S. Crooke, James W. Carr, Lebeus Chapman, Anthony Carrol, Washington Cockle, Alfred Colvill, Jacob G. Dyckman, Jary Dunn, Peter De Witt, John Fairlie, Lambert M. Feltus, George W. Giles, Neil Gray, Robert Jiles, jr. William Gracie, Adolphus N. Gouverneur, James Lorimer Graham, Dayton Hobart, Samuel V. Joffman, Philip Hamilton, William P. Hawes, Joseph Hyde, Charles G. Havens, Henry Hutchinson, Robert L. Jaques, Daniel P. Ingraham, Ambrose Kirtland, William Lowerre, Robert C. Ludlow, John M. Lester, James Lozier, Livingston Livingston, William Lee Morris, William H. Maxwell, Jeremiah Miller, jr. Jonathan Miller, Charles B. Moore, Cornelius Nagle, Alanson Nash, Henry N. coll, Jesse J. Jutley, Thomas O'Connor, Richard M. Popham, Ebenezer Palmer, Peter Pinckney, Cornelius Roosa, Daniel Phoenix Riker, Richard A. Reading, Thomas Jefferson Smith, Edward Sanford, Charles W. Sanford, Wm. H. Smith, William S. Sears, David B. Shepard, Reuben Spencer, Alfred A. Smith, Thomas G. Smith, John N. Taylor, Thomas W. Tucker, Thomas Alp Thomas, George N. Titus, Garret G. Van Wagener, James J. M. Valentine, Samuel Van Wyck, Dow D. Williamson, William C. Wetmore, Peter Wilson, Andrew Warner, William G. Wood, Uriah E. Wheeler, Alfred A. Weeks, David E. Wheeler, William D. Waterman, Ebenezer Whiting, Samuel Warford, Isaac Young, and Charles E. Young, commissioners of deeds.

[The above list of commissioners, with those heretofore appointed, completes the number of 100 for the city of New York.]

John Ahern, George F. Allen, Richard M. Blatchford, Robert Bogardus, Frederick W. Burke, John Bulkley, John A. Bogart, George C. Baldwin, Ebenezer Burrill, Thomas S. Brady, David M. Cowdrey, John D. Campbell, Gerardus Clark, Charles A. Clinton, George D. Cooper, Peter A. Cowdrey, Charles T. Cromwell, George Catlin, Thomas W. Clarke, Thomas N. Campbell, William N. Dyckman, Robert Day, William E. Dunscomb, John A. De Russey, John T. Duryce, Walter Edwards, Charles Edwards, Augustus Floyd, Morris Franklin, Henry P. Feltus, John Lorimer Graham, James W. Gerard, Thomas Goin, Andrew S. Garr, Francis Griffin, William G. Haydock, David Higgins, Henry W. Havens, Franklin S. Kinney, Cornelius V. S. Kane, Joseph Leonard, John R. Livingston, jr., Henry Laight, Jacob Morton, John F. Mitchell, Montgomery Moses, Peter S. Marcellis, Jas. W. McKeon, Solomon Melvin, John H. Magher, E. T. Throop Martin, Wm. O'Brien, Charles Oakley, Horatio G. Prall, Adam G. Pentz, Isaac Phillips, Wm. Poole, Samuel A. Porter, Anthony Rappels, Edward Radcliff, Samuel Stansbury, James B. Sheys, Wm. Soul, Thomas Slidell, Edward H. Seeley, Daniel B. Tallmadge, Francis R. Tillou, Wm. N. Titus, William K. Thorn, Edward N. Taylor, Wm. Van Hook, Wm. W. Wagener, John G. Van Buren, Joseph Wallis, Stephen C. Williams, Richard J. Wells, Harman Westervelt, Henry Wilkes, Joseph Woodward, and Caleb S. Woodhull, notaries public.

Thomas J. Shankland, inspector of domestic distilled spirits.

Naval.—The Brandywine frigate, and the sloop of war Falmouth, both at our navy yard, are under sailing orders. Their destinations are not generally known; but conjecture destines one to Europe with a *Plenipo*, and the other to relieve a ship in the Mediterranean. Much depends upon the proceedings of the Senate of the United States, before which body business of importance is pending.—[Gazette.]

CONGRESS—Thursday.—The following business was acted on this week.

Memorials were presented by Mr. Bradsley and Mr. Hard, praying Congress to provide for the construction of a Ship Canal around the Falls of Niagara.

Mr. Galbraith presented a memorial of a Convention of Delegates from Pennsylvania and New York assembled at Warrenton, (Pa.) on the 24th ult. praying Congress to provide for the improvement of the navigation of the Alleghany from Pittsburg to Olean Point—also a petition from inhabitants of Pennsylvania to the same effect—referred to the Committee on Roads and Canals.

Mr. Turrill—a petition for an appropriation for the improvement of the harbor of Sackett's Harbor; and

Mr. Day—from the inhabitants of Cayuga county to improve the navigation at the entrance of Little John's Bay, Lake Ontario—referred to the Committee on Commerce.

Mr. *Slane*, a petition of inhabitants of Buffalo, and of inhabitants of Detroit, for an appropriation for the construction of a harbor at the mouth of Chagrin river, Lake Erie.

Mr. *Lyon* presented a memorial of a general Convention of delegates held at Jonesville, the 6th ultimo, for the purpose of adopting measures preparatory to opening a communication between Lakes Erie and Michigan, by means of a Railroad across the peninsula between those Lakes; praying that a route for said Railroad may be surveyed by United States Engineers; and that Congress will make an appropriation to aid its construction—which were appropriately referred.

Mr. *Hazeltine*—the petition of sundry inhabitants of Chataque, Cattaraugus, and Erie, for an appropriation to be made for the construction of a beacon light at the mouth of Silver Creek harbor, on Lake Erie—which was referred to the committee having charge of the bill for the construction of light houses, &c.

Report of the Committee on Finance on the Removal of the Public Deposites, in the Senate of the U. S., Feb. 5, 1834.

THE Committee on Finance, to whom was referred the report of the Secretary of the Treasury, of 3d of December, 1833, on the removal of the public depositories from the Bank of the United States, and a resolution, submitted to the Senate by an honorable member from Kentucky, declaring that the reasons assigned by the Secretary for the removal of the said depositories, are unsatisfactory and insufficient, have agreed on the following report:

The act incorporating the Bank of the United States, as is justly remarked by the Secretary, is a contract containing stipulations on the part of the Government, and on the part of the corporation, entered into for full and adequate consideration.

The Government became party to this contract by granting the charter, and the stockholders by accepting it. "In consideration," says the charter, "of the exclusive privileges and benefits conferred by this act on the said bank, the president and directors thereof shall pay to the United States, out of the corporate funds thereof, one million and five hundred thousand dollars, in three equal payments;" and in another section, it declares that "during the continuance of this act, and whenever required by the Secretary of the Treasury, the said corporation shall give the necessary facilities for transferring the public funds from place to place, within the United States or the Territories thereof, and for distributing the same in payment of the public creditors, without charging commissions, or claiming allowance on account of difference of exchange; and shall do and perform the several respective duties of the commissioners of loans for the several States, or any one or more of them, whenever required by law."

The section immediately following this provision, is in these words: *And be it further enacted*, That the depositories of the money of the United States, in places in which the said bank and branches thereof may be established, shall be made in said bank or branches, unless the Secretary of the Treasury shall at any time, otherwise order and direct; in which case the Secretary of the Treasury shall immediately lay before Congress, if in session, and if not, immediately after the commencement of the next session, the reasons for such order or direction."

It is not to be denied or rebutted, that this custody of the public depositories was one of the "benefits" conferred on the bank by the charter, in consideration of the money paid, and the services undertaken to be performed

by the bank to the Government; and to this custody the bank has a just right, unless such causes have arisen as may have justified the Secretary in giving an order and direction for changing that custody. Any order or direction, therefore issued under the provisions of this law, necessarily involves a consideration of the just extent of the Secretary's power and of the rights of the bank.

But Congress, in making this provision, unquestionably had in view the safety of the public funds, and certain important financial objects, as well as the making of a just consideration to the bank, for the sum paid, and the services undertaken by it; and with this view, also, it has expressed its will, that the depositories shall continue to be made in the bank, until good cause shall arise for ordering otherwise. Of this good cause, the Secretary of the Treasury, in the first instance, and Congress, ultimately and conclusively, is constituted the judge. Every order, therefore, of the Secretary for changing the depositories presents for the examination of Congress, a question of general political propriety and expediency, as well as a question of right and obligation to the bank.

These questions may be considered together. They are intimately connected; because the right of the bank to retain the depositories, and to enjoy the advantages to be derived therefrom, cannot be denied, unless a case is shown to have arisen within the just power of removal, vested in the Secretary, and which made it his duty to exercise that power. The Secretary is only to remove the depositories for reasons. Of these reasons he is to give an account to Congress; if they be insufficient to justify the removal, the bank has a right to a return of the depositories, and the country has a right also, to expect that, in that case, the public treasure will be restored to its former place of safety.

The Secretary having removed the depositories, and having reported his reasons to both Houses, the whole subject is now before Congress, by way of appeal from his decision; and the question is, whether that decision ought to stand, or ought to be reversed.

The power of the Secretary under the law, is evidently but provisional. It is a power which he may exercise in the first instance, but the propriety of his conduct, in every instance, of its exercise, is ultimately referred to the wisdom of Congress, and by Congress it must be judged. He is authorized to do the act, but Congress is to examine it when done, and to confirm or reverse it. The Secretary may change the depositories, but when changed, Congress is to decide on the causes of such change, with authority either to sanction the removal, or to restore the depositories, according to its own judgment of right and expediency.

In order to decide whether the act of the Secretary ought to be confirmed, it is requisite in the first place, to form a just opinion of the true extent of his power, under the law; and, in the second place, to consider the validity of the reasons which he has specially assigned for the exercise of that power, in the present case.

The opinion of the Secretary is, that his power over the depositories, so far as respects the rights of the bank, is not limited to any particular contingencies, but is absolute and unconditional. If it be absolute and unconditional, so far as respects the rights of the

bank, it must be absolute and unconditional in all other respects; because, it is obvious, if there be any limitation, that limitation is imposed as much for the benefit of the bank as for the security of the country. The bank has contracted for the keeping of the public moneys, and paid for it, as for a privilege or benefit. It has agreed, at the same time, that the Secretary shall possess the power of removal; but then, it is also agreed, that whenever this power is exercised, the reasons therefor shall be reported to Congress; Congress being thus constituted the final judge, as well of the rights of the bank, in this particular, as of the good of the country. So that if the Secretary's power be in truth absolute and unconditional, it restrains Congress from judging whether the public good is injured by the removal, just as much as it restrains it from judging whether the rights of the bank are injured by the removal; because the limitation, if any, is equally for the security of the bank and of the public.

If the bank is interested in retaining the depositories, then it is interested in the truth or falsity, in the sufficiency or unsufficiency, of the reason given for their removal. Especially is it so interested, since these reasons are to be rendered to a tribunal which is to judge over the Secretary, and may form a different opinion on the validity of these reasons, and may reverse his decision. It clearly has an interest in retaining the depositories, and therefore is as clearly concerned in the reasons which the Secretary may give for their removal. And as he is bound to give reasons, this very circumstance shows that his authority is not absolute and unconditional. Because, how can an appeal be given from the decision of an absolute power; and how can such a power be called on to give reasons for any instance of its exercise? If it be absolute, its only reason is a reference to its own will.

The committee think, therefore, that no absolute and unconditional power was conferred on the Secretary; that no authority was given him by which he could deprive the bank of the custody of the public moneys without reason; and that therefore, his opinion is not to be admitted; that in no event can any order for removing the depositories impair the right secured to the bank by the charter. If removed without good cause, the committee think the removal does impair the rights of the bank.

But the opinion of the Secretary as to his own powers, is hardly more limited in respect to the Government and the country, than in regard to the rights of the bank.

His opinion is, that it is his duty, and within his authority, in this view, also to withdraw the depositories of the public money from the bank, whenever such a change would, in any degree, promote the public interest. "The safety of the depositories," he says, "the ability of the bank to meet its engagements, its fidelity in the performance of its obligations, are only a part of the considerations by which his judgment must be guided. The general interest and convenience of the people must regulate his conduct."

By the general interest and convenience of the people, the Secretary can only mean, of course, his own sense of that interest and convenience; because they are not otherwise to be ascertained than by his own judgment.

The Secretary's construction of the law is therefore, that he has power to remove the deposits, whenever, for any reason, he thinks the public good requires it.

In this interpretation of the design and object of the law, and this broad construction of the Secretary's power, the committee cannot concur.

Although the power of the Secretary is not restricted by any express words or terms, nor by any particular occasions for its exercise, specially and expressly designated or prescribed by the law, yet it is not to be admitted, as the committee think, that this power is to be exercised capriciously, or in an arbitrary manner, or for loose or conjectural reasons, or on any idea of an unlimited discretion, vested in the Secretary, to judge on the general question of the public welfare; or, indeed, on any other grounds than those of necessity, or plain and manifest expedience, directly connected with the subject over which the power exists.

The keeping of the public money is not a matter which is left, or was intended to be left at the will of the Secretary, or any other officer of the Government. This public money has a place fixed by law, and settled by contract: and this place is the Bank of the United States. In this place it is to remain, until some event occur requiring its removal. To remove it, therefore, from this place without the occurrence of just cause, is to thwart the end and design of the law, defeat the will of Congress, and violate the contract into which the Government has solemnly entered.

It is fit to be observed, that no other law confers on the Secretary such a wide discretion over the public interests, in regard to any subject, or gives him a power to act on the rights of others, or on the rights of the public, in part of his official duties, with so unlimited an authority as is here asserted. Every where else, he appears in the character of a limited and restricted agent. He is the financial officer of the government; he is the head of the department of the treasury. His duty is, to report annually to Congress the state of the finances, and to communicate to either house, when requested, any information respecting the Treasury; and he is to superintend the collection of the revenue. But he has no authority over the circulating medium of the country, either metallic or paper, nor has he the control of the national currency. It is no part of his duty either to contract or expand the circulation of bank paper, nor in any other way to exercise a general superintendence over the money system of the country. These general interests of the government and the people are not confided to his hands by any of the laws which created his office, and have prescribed his duties—and the committee are of opinion, that the charter of the bank no more intended to give such a wide scope to the Secretary, in regard to the deposits, than other laws intended to give him the same wide scope, in respect to other duties of his office. No intimation of such intention is found, either in the charter itself or in any of the legislative debates which took place in both Houses when the bank was established—or in the discussions which have been had on the various occasions which have been more recently presented for calling forth the sentiment of Congress. In none of these sources, is there to be found any proof that the legislature has delegated, or

intended to delegate, this extraordinary power of judging of the general interest of the people, to the Secretary of the Treasury. Such a power, did he possess it, would necessarily make him the general superintendent of all the proceedings of the bank—because it would enable him to compel the bank to conform all its operations to his pleasure, under penalty of suffering a removal of the public moneys. This would be little less than placing all the substantial power of managing the bank, in his hands. But he is not by law its manager, nor one of its managers—nor has he any right, in any form, to interfere in its management. On the contrary, the very language of the charter rejects all idea of such general supervision over its concerns by him, or any other officer of government. That language is, that "*for the management of the affairs of the corporation*, there shall be twenty-five directors annually chosen;" and, under the restrictions contained in the charter, these directors are entrusted with the whole general business of the bank, subject, of course, to all the provisions of the charter and the by-laws; subject, too, always, to the inspection and examination of either house of Congress; subject always to regular inquiry and trial, and bound always to communicate to the head of the treasury department, on request, statements of its amount of stock, debts due, moneys deposited, notes in circulation, and specie on hand.

Under these restrictions, the establishment of its offices, and the appointment of its officers, the amount of its discounts and every thing respecting those discounts; its purchases and sales of exchange, and all other concerns of the institution, are to be conducted and managed by the directors. There is nothing in the charter, giving the slightest authority to the Secretary to decide, as between the bank on the one hand, and the government or the people on the other, whether the general management of the directors is wise or unwise, or whether in regard to matters not connected with the deposits, it has or has not violated the condition of its charter.—The statement which the bank is bound to make to the Secretary, he may lay before Congress; and he is doubtless bound, by his official duty, to communicate to Congress any other information in his possession, tending, in his judgment, to show that the bank has disregarded its charter, or failed to fulfil all or any of its duties. But here his authority, so far as it regards the general course and operations of the bank, ends. It is then for Congress to act, if it see occasion, and to adopt the regular remedies, for any evils which it may suppose to exist. But it transcends the power of Congress itself to pronounce the charter violated, without hearing, without trial, without judgment, far less is any such power, of pronouncing final judgment confided to the Secretary. His power simply is, that in regard to the deposits of the public money, he is to judge, in the first instance, whether just cause has arisen for their removal.

The Secretary seems to suppose, indeed the very basis of his argument assumes, that the law has confided to him a general guardianship over the public welfare, so far as that welfare is in any way connected with the bank, or liable to be affected by its proceedings; and that he holds the power of the removing the deposits as the means, or instrument by which he is to enforce his own opinions respecting that welfare. The committee do not adopt this

opinion. They think that if such had been the design of the law, its provisions would have been different from those which it does actually contain.

If such general guardianship had been intended to be conferred on the Secretary, it is reasonable to believe that he would have been vested with powers more suitable to such a high trust. If he had been made, or intended to be made, general inspector or superintendent, other authority than merely that of removing the deposits, would have been given him, for this plain reason, that the government and the country have interests of much magnitude connected with the bank, besides the deposits of the public monies in its vaults, and to which interests if endangered, the removal of the deposits would bring no security.

The government is proprietor of seven millions of the stock of the bank, and yet no authority is given to the Secretary to sell this stock under any circumstances whatever, or in any other way to interfere with it.

The bill and notes of the bank, too, are made receivable in all payments to the United States until Congress shall otherwise order: and no power is given to the Secretary to prevent their being so received, either during the session of Congress, or in its recess, however the credit of these bills and notes might become depreciated.

How is it possible to conceive that, if Congress intended to give to the Secretary a general right to judge of the operations and proceedings of the bank, and a power, of course, to declare when it had violated its duty, and was no longer trustworthy, it should yet leave him under an absolute obligation to receive its bills and notes in all payments to the Treasury, though they might have lost all credit, and place no means in his hands to execute his high authority of superintendent, except the mere power of removal.

Wherever it is clear that Congress has given the Secretary a power, it has given him the means of informing his judgment as to the propriety of exercising that power. He has power to remove the deposits, and ample means are afforded him by which he may learn, from time to time, whether those deposits are safe. For this purpose, it is expressly made the duty of the bank to furnish him, so often as he shall require, if not oftener than once a week, with a statement of the amount of the capital stock of the corporation, of the debts due to it, of the moneys deposited in it, of its notes in circulation, and specie on hand, and he has a right to inspect the general accounts, in the books of the bank, relating to this statement. This statement enables him to judge of the solvency and stability of the bank, and of the safety of the public money deposited in it.—Here, then, is a power, and all appropriate means given for the just and enlightened exercise of that power. Confined to the deposits, the power is accompanied with all rational auxiliaries and attendants.

But for the depreciation of the bills of the bank, should that happen, and for other cases of maladministration, Congress has provided just and appropriate remedies, to be applied by itself or others, in exclusion of the Secretary.—For redress of these evils, no power is given to him.

For the security of the public interest, the law reserves a right to either House of Congress, to inquire at all times, into the proceedings of the bank, and if, on such inquiry, it appears in any respect to have violated its charter, Congress may bring it to trial and judgment. Power is given to the President, also, to institute judicial proceedings, if he shall have reason to believe that any such violation has taken place. But no such power is given to the Secretary.

The proposition, then, cannot be maintained, that Congress has relied, for the security of the public interest, and the preservation of the general welfare, so far as it is connected with the

bank, on a general discretion, reposed in the Secretary: for two reasons, first, because it has not given him the appropriate instances: and secondly, because it has, in those instances, either expressly reserved those powers to itself, or expressly conferred them on the President.

If the Secretary cannot prevent the notes of the bank from being received at the custom house, and the land offices, even after they should be discredited; if he have no power to touch, in any way, the seven millions of stock belonging to the Government; if the power of examination into the proceedings of the bank be given, not to him, but to either House of Congress; if he have no power, but Congress and the President, each has power, to direct a legal investigation into the conduct of the bank; how can it possibly be maintained that a general inspection and guardianship over the public welfare, so far as it is connected with the bank, is confided to him, and that his authority to remove the deposits, was given, not to protect the deposits themselves, and secure their proper use, but to enable him to enforce upon the bank, under penalty of their removal, such a course of management, as his sense of the public interest, and the convenience of the people, may require? Such a construction would give the law a strange and an undeserved character. It would convert the power of removal, intended for remedy and redress, into a mere instrument of punishment; and it would authorize the infliction of that punishment without hearing, or trial, in the very cases in which the law yet says, that if violation of duty be charged, the charge shall be heard and tried before judgment is pronounced, and the duty of preferring this charge, and of prosecuting it to judgment, is given, not to the Secretary, but to Congress, and to the President.

The contingent power given to the Secretary to remove the deposits, evidently shows that Congress contemplated the possibility of the happening of some sudden evil, for which, either no other remedy was provided, or none which could be applied with sufficient promptitude; and for which evil removal would be a just and appropriate remedy. The remedy prescribed, then, teaches us the nature of the evils which were apprehended. We can readily understand that threatened danger to the funds was one, and probably the chief of those evils; because change into other hands is the ready and appropriate measure, which would rationally suggest itself to all minds, as the proper security against such danger; and change is the remedy actually prescribed. Neglect to transfer the deposits from one place to another, as the exigencies of Government might require, and thereby to furnish those facilities of exchange, which the charter demands of the bank, without commission and without charge, is another evil for which, should it happen, the remedy would naturally be the withdrawing of the funds, and the placing of them in their former custody, so that they could be transferred or exchanged by the Treasury itself.

But who can see any connexion or relation, such as ordinarily exists between an evil apprehended, and a remedy proposed—between such an evil as a supposed over discount, for instance, by the bank, at one time, or an under discount at another, and the abrupt removal of the deposits? And if no one can see the connexion, how can it be supposed that, in giving the power of removal as a remedy, Congress had in view any such evil?

A question may arise between the Government and the bank, respecting the right of the parties to the sum of one hundred and fifty thousand dollars, as in the case of the French bill.

It is a question on which different opinions may be entertained, and which is, in its nature, fit for judicial decision. Does any man imagine that such a case as this was in the eye of Congress, when they granted the power of withdrawing the whole public treasure from

the Bank? Can it be for one moment maintained, that Congress intended that, in such a case, the Secretary should compel the bank to adopt his own opinion by the exercise of a power, the very exertion of which deranges the currency, interferes with the industry of the people, and, under some circumstances, would hazard the safety of the whole revenue?

The Committee think it cannot admit of rational doubt, that if Congress had intended to give to the Secretary any power whatever, not directly touching the deposits themselves, not only would it have specially pointed out the cases, but it would also, most assuredly, have provided a remedy more suitable for each case. The nature of the remedy, therefore, which is prescribed, clearly shows the evils intended to be provided against.

To admit the Secretary's conduct is subject to no control but his own sense of the general interest and convenience of the people, is to acknowledge the existence, in his hands, of a discretion so broad and unlimited, that its consequences can be no less than to subject, not only all the operations of the bank and its offices, but its powers and capabilities, perhaps its very existence, to his individual will. He is of opinion that the law creating it is in many of its provisions unconstitutional; he may not unnaturally, therefore, esteem it to be his duty to restrain and obstruct to the utmost of his power the operations of those provisions, thus deemed by him to be unconstitutional. He is of opinion that the existence of such a powerful moneyed monopoly, is dangerous to the liberties of the people. It would result from this, that if in the discharge of his official duty, he is to follow no guide but his own sense of the interest of the people, he might feel bound to counteract the operations of this dangerous monopoly, diminish its circulation, curtail its means, and prejudice its credit. To accomplish these very purposes, and these alone, he might withdraw the deposits. The power given him by Congress, would thus be used to defeat the will of Congress in one of its most important acts, by discrediting and otherwise injuriously affecting an institution, which Congress has seen fit to establish, and which it has declared shall continue with all its powers to the expiration of its charter.

The power conferred on the Secretary is a trust power, and like other trust powers, in the absence of express terms, setting forth the occasions for its exercise, it is to be construed according to the subject and object of the trust. As in other cases of the deposit of monies in Banks, the primary object sought to be accomplished by Congress, by that provision of the charter now under consideration, is the safe keeping of the money. The Secretary's trust therefore, primarily and principally, respects this safe keeping. But another object is distinctly disclosed in the charter, which object is intimately connected with the fund, and that is its transfer and exchange from place to place, as the convenience of Government might require. The Secretary's trust, therefore, respects also this other object thus connected with the fund; and when either of these objects requires a removal, a removal becomes a just exercise of his authority. To this extent, none can doubt the existence of his power. If, in truth, the money is believed to be unsafe, if, in truth, the Bank will not grant the facilities which it has promised, in consideration of receiving and holding the fund, then, certainly, it ought to be removed. But here the power must stop or else it is altogether unbounded. Here is a just and reasonable limit, consistent with the character of the power, consistent with the general duties of the Secretary, and consistent with the nature of the remedy provided.

The charter of the Bank is the law; it is the expressed will of the Legislature. That will is, that the Bank shall exist, with all its powers, to the end of its term. That will,

too, as the committee think, is, that the public deposits shall continue in the Bank, so long as they are safe, and so long as the bank fulfils all its duty in regard to them. The Secretary assumes a broader ground. He claims a right to judge of the proceedings of the bank on all subjects. Admitting the fund to be safe, and admitting that the bank has performed all its duties in regard to it, he claims an authority, nevertheless, to remove the deposits whenever he shall form an opinion, founded on the conduct of the Bank, in any particular whatever, and however unconnected with the public monies, that the general interest of the people requires such removal. If, in his opinion, it discounts too little, or discounts too much, if it expands or contracts its circulation too fast, or too slow; if its committees are not properly organized; if it claim damages on protested bills, which it ought not to claim; if, in his opinion, still, it is guilty of a wrong meddling in politics, or if it do any thing else, not consistent with his sense of the public interest; he has a right to visit it with a withdrawal of the public money from its custody.

If this claim of power be admitted, it would seem to the Committee to be a fair result that the Secretary has power to withdraw the deposits, for no other reason than that he differs with Congress upon its constitutional authority to create any bank, or upon the constitutionality of this particular bank, or upon the utility of continuing it in the exercise of its chartered powers and privileges, till its term shall expire.

The committee, therefore, are of opinion, that it was not the intention of the Legislature to give to the Secretary of the Treasury a general guardianship over the public interests in all matters connected with the Bank; but that his power is a limited one, and is confined to the safety, and proper management of that portion of the public interest to which it expressly relates, that is to say, to the public monies in deposit in the Bank.

But the extent of the Secretary's discretion, as asserted by himself, reaches even farther than the wide range which the committee has here described. It is not confined to the protection of all the various interests which the Government of the country have in the bank, or to a supervision and control over all the conduct of the bank, but it embraces all branches of the public interest, and touches every thing which in any way respects the good of the people.—He supposes himself rightfully to possess the power of removing the deposits whenever any causes, springing up in any part of the whole wide field of the general interest, may appear to him to call for such removal. Notwithstanding he may suppose all the great interests confided to the bank to be perfectly safe; notwithstanding he may have no occasion to complain of any part of its conduct; notwithstanding, even, it may so have demeaned itself as to have become the object of his favor and regard; yet, if his construction be admitted, he may remove the deposits simply because he may be of opinion that he might place them, with a prospect of still greater advantage, in other hands. If he be of opinion that the commerce of the country, or its manufactures would be benefited by withdrawing the public money from one bank and placing it in many, that would be an exercise of authority entirely within the limits which he prescribes to himself. It would be a case in which he would only follow his own sense of what the general interests and convenience of the people required. He might think, too, that by withdrawing all the public treasure from the Bank of the United States, and placing it in the hands of twenty or thirty State banks, to remain there during his pleasure, and to be drawn thence, again, at his will, he might be enabled effectually to advance certain other objects, which, whatever others might think of them, he might

consider to be essential to the good of the people. All this, if he be right, is within his just authority. A power, necessarily running to this extent, is a power, in the opinion of the committee, which can never be admitted.

Having thus expressed an opinion upon the general extent of the power claimed by the Secretary, the committee proceed to consider the reasons which he has reported to Congress as the particular grounds on which the power has been exercised in the present case.

The first reason assigned by the Secretary, is the near approach of the period when the bank charter will expire. That period is the 4th of March, 1836, more than two years distant; nearly two years and a half at the time of the removal. Three sessions of Congress, are, in the mean time, to be held; and inasmuch as the Secretary himself says that "the power over the place of the deposits for the public money would seem properly to belong to the legislative department of Government," the committee think it might reasonably have been expected by him, that Congress would not fail to make, in season, suitable regulations on a subject thus admitted to be within the just exercise of its authority, and properly one of its duties.

Why, then, should he not have waited till Congress had seen fit to act upon the subject, or had manifested a disposition not to act?—The matter of the deposits had been before Congress last session, and Congress had then thought no provision to be as yet necessary.—Its undoubted sense was, that the public moneys should remain where they were. This was manifested by proofs too clear to be questioned. Another session was fast approaching, and why was not the whole subject left where Congress had chosen to leave it at the end of its last session, to await the free exercise of its legislative power at this session? It might have been fit for the Executive to call the attention of Congress, at this time, to the necessity of some legal provisions respecting the future custody of the public moneys; and it would doubtless have been proper for Congress, without such call, to take up and consider the subject at its own suggestion; but the committee see no reason whatever, in the approaching expiration of the charter, for a change so sudden, and producing such important effects, made so long before that expiration, at a time when Congress had recently had the subject before it: and when, too, it was again about to assemble, and would naturally have reasonable and full opportunity to adopt any necessary legislative provisions.

The Secretary has stated no reason satisfactory to the Committee, for not deferring this important step until the meeting of Congress. He sets forth no emergency, no sudden occasion, nothing which, in their judgment, made immediate action by him necessary.

The Secretary supposes it to have been his duty to act on the belief that the bank charter would not be renewed; and he refers to recent popular elections in support of this opinion.—The Committee believe it altogether unusual for reasons of that kind to be assigned for public and official acts. On such subjects, opinions may be very various. Different and opposite conclusions may be drawn from the same facts by different persons. One man may think that a candidate has been elected on account of his opposition to the bank; another may see, only, that he has been chosen, notwithstanding such opposition. One may regard the opposition or the support of any measure, by a particular candidate, as having been, itself, a promoting cause of the success of his election; another may esteem it as a formidable objection, overcome, however, by more powerful reasons; and others, again, may be of opinion that it produced little or no effect on the one side or the other. But if inferences, less uncertain, could be drawn from such occurrences, the committee still think, that for a public officer to presume what

law the Legislature will or will not pass respecting matters of finance, from the election of a particular person to be Chief Magistrate, implies a consequence from such election which the constitutional independence and dignity of the Legislature do not allow to be admitted.

But if for this, or other reasons, the Secretary had persuaded himself that the charter of the bank would not be renewed, still, it certainly did not follow that the deposits ought to be removed before Congress had decided on the hands into which they should be transferred, and had made suitable regulation respecting their future custody. If there were good ground for thinking that Congress would not re-charter the bank, for that very reason there was equally good ground for supposing that it would make proper and suitable provision for the keeping of the public monies elsewhere. How could the Secretary doubt that Congress would omit to do that which he avers to be one of its appropriate duties? The question is, not what measures Congress might be expected to adopt—whether the re-chartering of the bank, or what other measures; but whether it ought not to have been presumed that it would adopt some measure, and that a seasonable and proper one, according to its power and its duties; and whether, therefore, this anticipation of the action of Congress, on the eve of its session, is to be justified.

The bank charter declares that the deposits of the public money shall be made in the bank and its offices, and that the bank shall continue till March, 1836. Where does the Secretary find his power to decide that the deposits shall be so made but for seventeen years from the date of the charter, instead of twenty? If he may thus withdraw the deposits two or three years before the expiration of the charter, what should restrain him from exercising the same authority five years before its expiration, or ten years? A plain and cogent necessity, the existence of a case which admits of no reasonable doubt, and which is too urgent for delay till Congress can provide for it, can alone justify an interference with the public monies lodged in the bank by law for the double purpose of safe keeping, and fulfilment of solemn contract.

But supposing it not reasonable for the Secretary to have expected the interposition of Congress, and admitting that he might consider the withdrawing of the deposits as an act which was to be done at some time by himself, how can it, nevertheless, be argued that so early and so sudden a withdrawal was necessary? The Committee can perceive no possible reason for this in any state of facts made known to them.

The withdrawal of the money left on deposit from a bank whose charter is about to expire, is naturally one of the things longest postponed. It is as safe the last day of the existence of the bank, in common cases, as at any previous period. The bank expects the recall of its deposits near the period of its expiration, and prepares itself accordingly. The operation, if made gradually, produces, when thus conducted, the least possible disturbances in the business of the community. Former experience would seem to have held out a salutary light for the guidance of the Secretary in this part of his official duty.

At the time of the expiration of the charter of the former bank, Mr. Gallatin was Secretary of the Treasury, and the public deposits were in the bank. The charter of the bank was to end on the 4th of March, 1811, and it does not appear that Mr. Gallatin thought it necessary to make any provision whatever for removing any part of the deposits, except by drawing on them for the common uses of government, until late in the very month preceding the expiration of the charter. A large amount of those deposits remained, indeed, in the vaults of the bank after its charter had expired, and until they were wanted in the general operations of the Treasury. And why

should it be otherwise? Why should that be done suddenly now which the Secretary thinks could not be done suddenly hereafter, without great inconvenience? Is it not the just inference, from his own argument, that the thing should not have been done suddenly at all? As to the idea, that the credit of the paper of the bank will be depreciated, near the time of the expiration of its charter, or that it would be inconvenient for it, at that time, to be called on for the deposits, the committee are utterly at a loss to see the slightest foundation for such an opinion. Experience is against it; and all reason, as the Committee think, is against it also. There is nothing to render it in any degree doubtful, that the bills of the bank will be in as good credit, the last day of its charter, and even after that time, if any shall be outstanding, as they are now; and there is as little to render it doubtful, that then, as now, the bank would be competent to answer all demands upon it. In the opinion of the Committee, the withdrawal of the fund was both unnecessarily early, and unnecessarily sudden. It might have been made gradual; it might have been deferred; and it might have been, and ought to have been, as the Committee think not ventured upon at all, until the attention of Congress itself had been called to the subject. The Committee therefore, entirely dissent from this first reason, reported by the Secretary. They see nothing which proves to them the existence of the slightest occasion for taking this important step, at the moment it was taken. So far as it depends on this reason, the Committee think the removal was made without necessity; without caution or preparation; with a suddenness naturally producing mischievous consequences, and in unjustifiable anticipation of the legislation of Congress.

But the Secretary thinks there are other reasons for the removal, growing out of the manner in which the affairs of the bank have been managed, and its money applied, which would have made it his duty to withdraw the deposits, at any period of the charter.

Of these reasons, thus arising from the alleged misconduct of the bank, the first is, that many important money transactions of the bank are placed under the control of a Committee of Exchange, of which Committee, no one of the public Directors, as they are called, is allowed to be a member, instead of being transacted by a Board of seven Directors.

This charge consists of two parts; first, that the discounts of bills are made by the committee; and not by a quorum of the board; second, that the public directors are not allowed to be of this committee.

First. It is not alleged that, in the discounts of bills by this committee, any indiscretion has been committed, or any loss incurred, or that in consequence thereof, any facility to the mercantile community has been withheld, or any duty of the bank to the Government violated. The objection is, simply, that bills are discounted by a committee. Supposing this to be an irregularity, or illegality, in the proceedings of the board, how is it to be corrected by withdrawing the deposits? What connexion is there between the two things? It is not pretended that this mode of discounting bills, endangered the deposits; it is not pretended that it made the bank either less able, or less willing, to perform every one of its duties to Government. How should the withdrawal of the deposits then be suggested, by the discovery of such an irregularity, real or supposed? The committee are not able to perceive the least propriety, in applying the power of removal, to a proceeding of this kind, even if it were admitted to be irregular or illegal. But is the practice illegal. It is believed to be not at all unusual? It is believed to be quite common, in banks of large business, for bills of exchange, which are presented every day, and almost every hour in the day, to be discounted either by a committee of the directors, or by the president, or even other officers; acting under such general or-

ders and instructions as the directors, at their stated meetings, prescribe. A large board of directors cannot assemble every day, perhaps not oftener than twice a week. If bills of exchange could only be discounted at these periodical meetings the business of exchange could not go on with the promptitude and despatch so important to commercial men in such transactions.

The committee suppose the truth of these remarks will be at once admitted by all who have knowledge of business of this kind.

The general management and control, the authority of examining and supervising, of contracting or enlarging the amount of daily discounts, according to the state of the bank, and of giving every other order and direction on the subject, still remains with the directors, and is constantly exercised by them. They still manage the affairs of the bank, in the language of the charter, although they may depute to a committee the authority of inquiring and deciding upon the credit of persons whose names are on bills of exchange offered for discount, and on the rate of exchange, current at the day. The legal question would be, whether the directors, by rule or by law, may not authorize a small number of their own board to discount bills. The bank has been advised that it might rightfully do this; and if it be not clear that this opinion is right, it is certainly far from clear that it is wrong; and in this state of the question, the general practice of other banks, under similar provisions in their charters, may well relieve the directors from the imputation of intentional mismanagement.

If, in all this, the bank has violated its charter, what other banks of extensive business have not done the same thing?

But the other subject of complaint, and that which seems to be regarded as the more offensive part of this regulation, is, that the public directors, as they are called, were not allowed to be on this committee.

It may be observed, in the first place, that if the discounting of bills of exchange, by a committee instead of a whole board of directors, be illegal, it would hardly be rendered legal by placing any or all of these public directors on the committee as members. But the Secretary seems to suppose that there was some particular object in this exclusion of these directors, as if there had been something wrong to be done, and therefore secrets to be kept by this committee. It is not easy to see what foundation there can be for this opinion. All these discounts are matter of record. They appear every day in the books of the Bank. Every director, on or off the committee, sees them, or may see them, at pleasure. There is no secrecy, nor any motives for secrecy, so far as this committee can perceive. Very proper causes may have existed, for ought that can have been known by the Senate, for the omission of these particular directors from this particular committee. Their services might have been deemed more useful in other committees, or however respectable in general character, or however useful in other parts of the direction, they may have been esteemed not so well acquainted as others with the business of foreign and domestic exchange. And even if there were, or are other causes for the omission, such as tend less to prove the existence of that harmony and mutual respect which it is so desirable should prevail in such a board, these causes cannot furnish any just ground for asserting, either that the business of exchange was illegally conducted, or that the constitution of the committee was proof of the existence of any motive not fit to be avowed.

But the Secretary entertains an opinion respecting the character and duties of the directors appointed by the President and Senate, in which the committee do not concur. He denominated them "public directors"—"officers of the Government," &c.

By the charter of the bank there are to be

twenty-five directors. Of those, twenty are to be chosen by the individual stockholders, and five appointed by the President, with the advice and consent of the Senate. As the Government owned one-fifth of the stock of the bank, it was judged expedient to place in the hands of the President and Senate the appointment of one-fifth of all the directors. But they are not called public directors, nor officers of the Government, nor public agents. Nor are they entitled, so far as the committee can perceive, to either of these appellations, any more than the other directors. The whole twenty-five directors are joint managers of a joint fund, each possessing precisely the same powers, and charged with the same duties as every other. They derive their appointments, it is true, from different origins, but when appointed, their authority is the same. There is not one word in the charter intimating, in the remotest manner, that the five directors appointed by the President and Senate have any particular duty, or are the objects of any particular trust. The charter calls them not Government directors, not public directors, but simply the directors appointed by the President and Senate. They are placed in the direction to consult with the other directors, for the common good of the bank, and to act with these others, and vote with them on all questions. They are, what the law calls them, directors of the bank, not agents of the Government. They are joint trustees with others, in a joint interest. If any thing illegal or improper takes place in the board, they are bound to resist it by the duty which they owe the individual stockholders, as much as by the duty they owe the Government; because they are agents of the individual stockholders, and have the same authority to bind them by their acts, as to bind the Government; and, in like manner, it is the duty of those directors who are appointed by the individual stockholders, to give notice, as well to Government as to the stockholders, if any thing illegal take place, or be threatened. All those directors act and vote together on the smallest as well as on the highest occasions; and by their joint votes, bind the corporation, and bind both the Government and individual stockholders to the extent of their respective interests in the corporation.

If the directors appointed by the President and Senate had been excluded by the charter, from any part of the power exercised by the others; if it had been forbidden them to interfere, to the same extent, and with the same effect, as the rest, in the common business of the bank, there might be some reason for supposing that an uncommon character, a character not so much of action as of supervision and inspection, was intended to be conferred on them. But they do interfere, and justly, in all transactions of the bank. They do vote and act on all subjects, like the other directors. Being then possessed of this common character of directors, and enjoying all its powers to the fullest extent, the committee know no form of argument, by which an uncommon and extraordinary character is to be raised by construction, and superadded to the common character of directors, which thus already belongs to them.

By granting the charter, and by accepting it, the Government on the one hand, and the individual stockholders on the other, have agreed, that, of the directors, as joint agents of all parties, the stockholders shall appoint twenty, and the Government five. The interest of all parties is confided to this joint agency; and any distinction in their powers, as arising from their different modes of appointment, is in the judgment of the committee not to be sustained. They regard such distinction as entirely inconsistent with the nature of the agency created, and as deriving not the least countenance from any thing contained in the law.

The committee, nevertheless, to avoid misapprehension, wish to repeat, that it is undoubtedly the duty of the directors appointed by the President, and of all directors, to give notice, both to Government and the stockhold-

ers, of any violation of the charter committed or threatened.

The Secretary of the Treasury has thought proper to observe, that the measures of the committee of exchange are, as it appears, designedly and by system, so arranged as to conceal from the officers of the Government transactions in which the public are deeply involved. This, it must be admitted, is a very serious charge. It imputes a corrupt motive. The committee have sought for the foundation, either in evidence or argument, on which this charge rests. They have found neither. They find only the charge, in the first place; and then they find the charge immediately stated as a fact, and relied on as the basis of other charges.

The second reason specially reported by the Secretary as arising from the conduct of the bank, respects the bill of exchange drawn by the Secretary of the Treasury on the Government of France, and purchased by the bank.

The general facts connected with this case are these:

By the late treaty of indemnity between the U. States and France, it was stipulated that the French Government should pay to that of the U. States twenty-five millions of francs, to be distributed among those American citizens who had claims against France for the unlawful seizure, capture, and condemnation of their vessels and property, the whole sum to be paid in annual instalments of four millions one hundred and sixty-six thousand six hundred and sixty-six francs, each, into the hands of such persons as shall be authorized by the Government of the U. States to receive it; the first instalment to be paid at the expiration of one year next following the exchange of the ratification.

On the expiration of the year, the Secretary drew a bill of exchange, signed by himself as Secretary, on the French Government for the amount of this instalment, and sold it to the bank, like any other bill of exchange, and received the proceeds by credit of the amount to the account of the Treasurer in the bank.

On presentation of the bill at the French Treasury, payment was refused; the bill was accordingly duly protested, and it was then taken up by a third person for account of the bank. The damages accruing on this bill, according to law and to constant usage in such cases, are one hundred and fifty-eight thousand dollars.

If this bill had been transferred by the bank, as probably it was, the bank itself would have been answerable for damages even at a higher rate, if a third person had not taken up the bill for the honor of the bank.

On receiving information of the protest of the bill, the officers of the bank, as was their duty gave immediate notice to the Treasury Department, and accompanied that notice with the information, always made in such cases, that the drawers of the bill would be held answerable for the damages. Such is the substance of the facts in this case.

The bank it would appear, was willing to collect the bill on the account of government, and to credit the Treasury with the proceeds when received: a course of proceedings which had this to recommend it, that the money to be received on the bill, was to be received by the government simply in trust for claimants under the French treaty, and was not ultimately destined to the ordinary uses of the Treasury. On the contrary, indeed before the dishonor of the bill was known, it had been made, already, the legal duty of the Secretary to place the fund, so soon as received, at interest for the benefit of the claimants.

But it was thought best to sell the bill, and to realize at once its amount into the Treasury; and the bill was sold to the bank, in preference to others offering to purchase, for no reason, it is to be presumed, except that the terms of the bank were more satisfactory. The bill was thus purchased by the bank, and its proceeds credited to the Treasury. This was a mere transaction of the purchase and sale of a bill of exchange. There was no trust confided to the bank and no fiscal agency in the whole

matter. Indeed the agency of the bank had been declined, the Secretary preferring to deal with it not as an agent, but as a purchaser, proposing to it not to collect the bill, but to buy it. On being remitted to Europe, and presented for payment, the bill was protested. By the universal commercial law, the Government, on the occurrence of this protest, became amenable to the bank for the amount of the bill, with damages. These damages may be ultimately claimed, with justice from the French Government if the bill was drawn upon sufficient grounds, and on proper authority; in other words, if the obligation of the French Government was such that it was bound to accept and pay the bill: but unless there be something in the case to vary the general rule, which the committee do not perceive, these damages were part of the debt which had become due to the bank, as much as the principal sum of the bill. If this be so, how could the directors relinquish this part of the debt any more than the other? They were agents for the corporation; they act as trustees, and have no authority, without consideration, to release, either to the Government or to individuals, debts due, or properly belonging to the corporation.

It has been suggested that the bank should have taken up this bill, when protested on government account. Two answers may be given to this suggestion: the first is, that the bill had been taken up by a correspondent abroad for account of the bank, before it was known in the United States that it had been protested.—The second is, that it would have been unlawful for the bank to have advanced such amount to the Government or on account of Government for the purpose of taking up this bill, or for any other purpose, without an act of Congress. The express words of the charter forbid it.

But, as a reason for removing the deposits, it appears to the committee quite immaterial whether the bank be right or wrong in claiming these damages. If wrong, it will not recover them. It is not to judge of its own rights, and if the appropriate tribunals shall decide that the bank was acting on this occasion, or ought to have acted as the agent of Government, or that it was its duty to take up the bill on account of Government, then the damages will not be awarded to it. And in the worst aspect of this case, how can its conduct in this respect be any possible reason to justify the removal of the deposits? What connexion has this occurrence with the safe keeping of the public treasures, or with the remitting them from place to place, to meet the convenience of the Government, according to the duty of the bank under the charter? The bank thinks itself entitled to damages on a protested bill, purchased and held by itself, and drawn by Government. The Secretary of the Treasury thinks otherwise. If there be no reason to doubt the sincerity of the Secretary's conviction, there is as little to doubt the sincerity of that entertained by the bank; and it is quite inconceivable to the committee that the pendency of such a difference of opinion, on such a question, should furnish any reason whatever for withdrawing the deposits, unless it be at once admitted that the Secretary holds the power of removal as a perfectly arbitrary power, and may exercise it, by way of punishment, whenever, in any particular, the conduct or the opinions of the bank do not conform to his pleasure.

The Secretary does not argue this matter.—He offers no reason in opposition to the legal right of the bank to the damages claimed.—Indeed, he hardly denies the right. He commences his observations on the subject by saying that the ruling principle of the Bank is its own interest; and closes them with another declaration, that, as fiscal agent of the public, it availed itself of the disappointment of its principal for the purpose of enlarging its own profits.

Assertions like these, however else they may be disposed of, cannot be made subjects of argument.

The last charge preferred against the bank, is, that it has used its means with a view to obtain political power, and thereby secure the renewal of its charter.

The very statement of such a charge, as a reason for removing the deposits, is calculated to excite distrust in the wisdom and propriety of that measure; because the charge, too general to be proved, is too general, also, to be disproved; and since it must always rest mainly on mere opinion, it might be made at any time, by any Secretary, against any Bank. It would be, therefore, always a convenient cloak under which to disguise the true motives of official conduct.

If proof be made out that the funds of the bank have been applied to illegal objects, the proper mode of redress and punishment should have been adopted, but what has this to do with the deposits? As in the case of the French bill, the Secretary cannot justify the removal of the deposits on any such ground as this, unless it be conceded that he may use the power of removal as a punishment for any offence of any kind which the Bank in his opinion, may have committed. The committee have already expressed the opinion that no such latitude of power belongs to him, and the assertion of such a power, for such a cause as is now under consideration, shows that the power ought never to belong to any Secretary; because the offence, on account of which it is here proposed to be exercised, is a political offence, incapable of definition, depending merely on the Secretary's opinion, and necessarily drawing into its consideration all the exciting controverted topics of the day. The bank, it is said, "has sought to obtain political power." What is the definition of such an offence as this? What acts constitute it? How is it to be tried? Who is to be the judge? What punishment shall follow conviction? All must see that charges of this nature are but loose and vague accusations, which may be made at any time, and can never be either proved or disproved; and to admit them as sufficient grounds, or justify the removal of the deposits, would be to concede to the Secretary the possession of a power purely arbitrary.

The main fact relied on for this cause of removal shows how extremely unsafe all proceedings on any such reasons must be. The main fact is, that, between December 1850, and December 1851, the bank extended its loans twenty millions of dollars; and it is further alleged that, as if to leave no doubt on the motive of this extraordinary conduct, it continued to add rapidly to its loans, until in May, 1852, while its petition for renewal was pending, those loans amounted to seventy millions. And the Secretary declares that this extraordinary increase of loans made in so short a space of time, and on the eve of a contested election, in which the bank took an open and direct interest, demonstrates that it was using its money to obtain a hold upon the people of the country to induce them, by the apprehension of ruin, to vote against the candidate whom it desired to defeat. This is a strong assertion, but, so far as the Committee perceive, it is assertion merely. It is but the Secretary's own inference from facts, from which very facts his predecessors in office have drawn no such conclusions.

This great extension of the loans, be it remembered, took place in 1851. Why was it not then complained of? How should it have escaped the vigilance of the Secretary at that day at the time it took place? And if it did not escape his vigilance, why did he not then remove the deposits? So, also, as to the amount of loans in May, 1852. That amount was perfectly well known at the time, and if it proved any offence, why was not the punishment inflicted then? How should all other Secretaries have slept over this great mischief?

It might further be well asked, what evidence is there of the existence of any such motive as is imputed to the Bank in this extension

of its loans? There is no evidence but the mere fact itself of the extension, and it cannot be denied that other and very different reasons for the extensions may have existed; so that the charge is proved no otherwise than by inferring a bad motive from an act lawful in itself, and for which good reasons may have existed, nor is it either acknowledged, nor, so far as the committee know, proved that the bank took an open and direct interest, as a corporation, in the election referred to. The bank certainly was much interested in certain accusations which had been brought against it, and which became subjects of public discussion during the pendency of that election. It had been charged with great misconduct and gross violation of its charter. These accusations must undoubtedly have called on the directors for answer. If made before Congress, they were to answer before Congress; if made judicially, they were to answer in the courts; if made in an official and formal manner, and in that manner submitted to the judgment of the country, the directors were bound to meet them before that country by every fair use of fact and argument, not only for the purpose of defending themselves as directors, but for the higher purpose of maintaining the credit of the bank, and protecting the property entrusted to their care. If in thus defending the bank before the community, the directors carried their measures beyond this fair object of defence, or if they resorted to dishonorable or indecorous modes of discussion; if they sought rather to inflame than to reason; if they substituted personal crimination for argument; if, even, they met invective and violence with corresponding invective and violence; they followed bad examples, and are not to be justified.

But on their right to defend themselves before the public against grave charges brought against them and urged before the public, the committee entertain no doubt, and they are equally clear in opinion that the Secretary of the Treasury is not constituted the judge of the mode of exercising this right, and cannot justly remove the deposits merely because the conduct of the bank, in this particular, has not happened to conform to his wishes.

The committee, therefore, consider this last reason of the Secretary equally insufficient with the rest; and they regard it as the most objectionable of all in its principle, inasmuch as it proceeds on grounds which, if admitted, would leave a very high official duty to be exercised from considerations connected with the political feelings and party contests of every day, with no guide but the individual opinion of the officer who is to perform the act; an opinion which, it is possible, may be no less tinged with political motive and feeling than the conduct which it would reprehend.

If an unlimited power be conceded to the Secretary to inflict penalties on the bank for supposed political motives in acts legal in themselves, where is the security that the judge may not be found acting under the same impulses which he imputes to the party accused?

The committee entertain no doubt that the immediate cause of the existing public distress is to be found in the removal of the public deposits, and in the manner in which that removal has been made. No other adequate cause has been suggested; and those who justify the removal do not so much deny this to have been the cause, as insist that it was not necessary that any such effect should have followed from it. In other words, they argue that, notwithstanding the removal, the bank still possessed the power, if it had chosen to exercise it, of warding off the blow which has fallen on the country, or at least of mitigating its severity.

Nothing could have been rationally expected but that the bank, deprived of the deposits, and denounced by the Executive Government, would feel itself called on to take just care of its own interest and its own credit. Of the means necessary to the attainment of these

ends, the directors alone were judges, and the committee have no evidence before them to show they have not exercised their judgment fairly, and with a real solicitude to accommodate the commercial community in the altered state of things as far as has been practicable, consistently with the security of the institution, which it is equally their duty to the public and the stockholders to maintain. They are certainly under every obligation of duty, in the present distressed state of the country, to do every thing for the public relief which is consistent with the safety of the bank, and with those considerations which the approaching expiration of its charter makes it important for the directors to regard.

The removal itself, and the matter of effecting it, are causes entirely sufficient, in the judgment of the committee, to produce all the consequences which the country has experienced, and is experiencing; and these consequences, they think, are to be referred to these causes as their just origin. How could any other result have been expected? The amount of the deposits was nine millions of dollars. On this amount in deposit there was sustained, no doubt, a discount of far greater magnitude. The withdrawal of this sum of nine millions from the bank, necessarily compelled it to diminish its discounts to the full extent of all that part which may be supposed to have been sustained by it. It is to be remembered, too, that this was done at a moment when business of every kind was pressed with great activity, and all the means of the country fully employed.

The withdrawing of so large an amount at such a time, from hands actually holding and using it, could not but produce derangement and pressure, even if it had been immediately placed in other banks, and if no unfriendly feeling, and no want of confidence, had attended the transaction. But, it is quite obvious that the operation to which the Secretary has resorted has been attended with both these additional and powerful causes of derangement. It has created unfriendly feelings, and it has diminished confidence. This change of the deposits is made on the strength of charges against the bank of a very grave and aggravated nature, such as, if true, would most seriously affect its credit for solvency and stability. It is proclaimed to the whole world as having converted itself into a political partisan, misapplied its funds, neglected its highest duties, and entered on a career of electioneering against the government of the country.

These serious charges necessarily put the bank on its defence, and the extraordinary spectacle is exhibited of a warfare by the National Government on the National Bank, notwithstanding that the Government is itself a great proprietor in the bank, and notwithstanding that the notes of the bank are the currency in which the revenues of the country are by law receivable.

The true and natural relation between the Government and the bank is altogether reversed. Instead of enjoying the confidence of the Government, it is obliged to sustain its most serious official assaults, and to maintain itself against its denunciations. The banks selected by Government as its agents are themselves thrown, perhaps unwillingly, into an attitude of jealousy and suspicion with the Bank of the United States. They become cautious and fearful, therefore, in all proceedings; and thus those who should co-operate to relieve the public pressure, are considering mainly their own safety. Fearful of each other, and fearful of the Government, they see the distress continue with no power of beneficial interposition.

It may be asked, why are not these deposit banks able to maintain at large a circulation on the nine millions of deposits as the Bank of the United States? And will they not be thus able when the present panic shall have subsided? The committee think both the questions easily answered.

The Bank of the United States has a credit more general, it may be said more universal,

than any State bank does possess. The credit of the Bank of the United States is equally solid, its bills and notes received with equal confidence for the purpose of circulation and remittance, in every quarter of the country. No paper circulation, so far as the committee know, which ever appeared in the world, has approached nearer to the value and uniformity of a specie currency than the notes and bills of the Bank of the United States. To the State banks these notes and bills have performed the office of specie. All the State banks have discounted upon the possession of them, with the same freedom and boldness as they would have done on an equal amount of the precious metals. The curtailment of their circulation, therefore, if not merely a withdrawing of the amount curtailed from the general mass of circulation, it is removing, rather to the amount curtailed, the basis of the general circulation; and although the actual amount of notes and bills has not been recently greatly diminished, there is reason to suppose that the amount held by the State banks has been greatly diminished.

The removal of the deposits has operated directly on the amount of the circulating medium, at a moment when that amount could not bear any considerable reduction suddenly made, without producing sensible effect. It has diminished prices, and, in some instances, it has had this effect to a very material degree. It has operated on the internal exchange, and has most manifestly been attended with very serious and heavy inconveniences in that important branch of the national interest. More than all, it has acted on opinion; it has disturbed the general confidence, it has weakened the public faith in the soundness of the currency, and it has alarmed men for the security of property. As yet, we hardly know its effects on the credit of the country in Europe. Perhaps it is not easy to anticipate those effects; but if causes which operate here should be found to have been efficient there also, a still greater degree of pressure and distress than has yet been felt may be expected.

The committee, therefore, cannot but regard the removal of the deposits, on the whole, as a measure highly inexpedient, and altogether unjustifiable. The public monies were safe in the bank. This is admitted. All the duties of the bank connected with these public monies were faithfully discharged. This, too, is admitted. The subject had been recently before the House of Representatives, and that house had made its opinion against the removal known by a very unequivocal vote. Another session of Congress was close at hand, when the whole matter would come again before it. Under these circumstances, to make the removal, with the certainty of creating so much alarm, and of producing so much positive evil and suffering, such derangement of the currency, such pressure and distress in all the branches of the business of private life, is an act which the committee think the Senate is called on to disapprove. The reasons which have thus been stated apply to the whole proceedings of the Secretary relating to the public deposits, and make it unnecessary to consider whether there be any difference between his power over monies already in the bank, and his power to suspend future deposits. The committee forbear, also, to consider the propriety of the measures adopted by the Secretary, for the safe keeping of the public monies since their withdrawal from the bank. They forbear, too, from entering into any discussion, at present, of the course of legislation proper to be adopted by Congress under the existing state of things. In this report, they have confined their consideration to the removal of the deposits, the reasons assigned for it, and its immediate consequences; and on these points they have formed the opinions which have now been expressed.

They recommend to the Senate the adoption of the resolution which has been referred to them.

RAILROAD CAR WHEELS AND BOXES, AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Bleeker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation. J8tf

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Non's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, postpaid. 41 R J M M & F

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29tf RM&F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch, 300 do. 1 1/2 do. 40 do. 1 1/2 do. 800 do. 2 do. 800 do. 2 1/2 do. soon expected.

Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 4 1/2, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments, and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. 471meowr

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 779 of this Journal. d6

At the commencement of the last year I offered to send the American *tri-weekly* instead of *semi-weekly*, together with two of my periodicals, in exchange to those who would publish my advertisements of the different periodicals. In consequence of this notice, the exchange list was increased to 165. I soon found that the expense would be greater than I had anticipated, yet I had made the offer, and would of course continue it through the year—as I have done. I however find it *too expensive* to continue to send as heretofore. The circulation of my PERIODICALS, (upon which the expense falls,) will not warrant it, and I must, therefore, notwithstanding the uniform kindness with which they have been treated by those to whom they have been sent, materially reduce their exchange list.

The *semi-weekly* American will hereafter be sent in exchange to those who will publish the following advertisements a few weeks for the difference of price. *New-York, January 20, 1834.*

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in *semi-monthly* form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

D. K. Minor also publishes the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

A scientific person versed in Mechanics, Chemistry and Mineralogy, of several years practical experience in different branches of Civil Engineering, and who is also a good draughtsman, is desirous of obtaining employment either as an instructor in some public institution, or as an Engineer upon some private or public work.

He was educated at one of the first scientific institutions in the United States, and was for several years an instructor in the said institution.

A line addressed to B. at Railroad Journal Office, No. 35 Wall street, will meet with immediate attention.

LB ANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

G. LANSING, Engraver on Wood,
35 WALL STREET.

All kinds of Machinery correctly drawn, and neatly engraved.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer, Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania. Hudson, Columbia county, New-York, { January 20, 1834.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information: The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any other in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the railroad.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

German town, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Engr. Philad., German and Norristown Railroad.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber.

D. K. MINOR, 35 Wall street. New-York, August 14, 1833.

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 8th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushon & Aspinwall, Druggists.

Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

81 R F M & F

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 58 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, and one which all Instruments are liable to a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Heartt.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, FEBRUARY 22, 1834.

RAILROADS IN ALABAMA.—We are highly gratified to learn, as we do from the following extracts, that the inhabitants of *Alabama* are pushing forward their works of internal improvement with a spirit, which, if it does not stimulate those of *older* states to action, will at least, we hope, richly reward those who have invested their funds in an enterprise so creditable and so useful.

Railroad.—We regret to state that the first contract, from this place to Courtland, is not yet completed. It is, however, far advanced, and steadily progressing. We understand that the cars now run within seven or eight miles of Courtland, and that not more than about one-fourth of the work, on this remnant of the contract, remains unfinished.

We have the best assurance that the work will all be completed, by or near the first of October next, the time specified in the contracts.

Operations have already commenced under the new contracts, and upwards of one hundred hands are now at work.—[North Alabamian.]

T Tuscumbia, Courtland, and Decatur Railroad.—We are gratified to learn, by means of a letter received from David Hubbard, Esq. Secretary of the Tuscumbia, Courtland, and Decatur Railroad Company, the following facts in relation to the progress of this noble enterprise. "On yesterday (16th inst.) the Tuscumbia, Courtland, and Decatur Railroad Company let to contract the whole line of the road to Decatur, to be finished by the first day of October next, (1834.) From the anxiety manifested to get contracts, by able and responsible bidders, the company had no difficulty in letting out to the best description of men, and on good terms. No doubt is entertained but that the road will be completed in time for planters

above the shoals to get their next crops to market as soon as it can be gathered, without waiting for a tide. But what is of equal importance to the people of Huntsville and Madison county generally, the board of directors, also on yesterday, adopted the following resolution:

'Resolved, That if the right of way can be had, from planters along the line, the Tuscumbia, Courtland, and Decatur Railroad Company will extend their road to Huntsville and have it completed during the next year.'—[Huntsville (Ala.) Mercury.]

There can hardly be a doubt, we should think, but that the inhabitants on the line will not only assent, but also, with the inhabitants of Huntsville, give their hearty support to a measure which will so largely contribute to their immediate prosperity.

The Tuscumbia, Courtland, and Decatur Railroad is certainly a measure creditable to those who projected and have thus far prosecuted the work; but we apprehend that the road between the two extremes is a *small* part only of the line of railroad which will ultimately be connected with it. It will be observed, by a reference to the map, that it is in the direct course of a continuance of the South Carolina Railroad to the Mississippi River at Memphis, or some other suitable point—perhaps *Natchez*; and who that has observed the progress of improvements within the last few years, can doubt the ultimate accomplishment of a work so desirable? It will also be intersected by branches from Tennessee, on the north, and from the interior of Alabama on the south. One has already been chartered from Moulton, the county seat of Lawrence county, to connect at some suitable point, probably at Courtland. In short, the Tuscumbia, Courtland, and Decatur Railroad is a *germ* from which many others will spring: a work, therefore, which will do great and lasting credit to those who projected and have thus far prosecuted its accomplishment.

ITHACA AND OWEGO RAILROAD.—We learn by a letter received in this city, from John Randel, Jr. Esq. the engineer of this road, that on the 13th of the present month, 13 miles of this road were opened for transportation and travel. The inclined plane at Ithaca was for the first time used, and successfully. A car loaded with two tons of iron and thirty passengers,

passed up the great plane, an elevation of 405 feet, in eight minutes. On the 15th, the road was to have been still further opened to a place beyond Smith's tavern, which is more than half the whole distance to Owego. By the middle of April, if no uncommon event should interfere, the whole line will be finished to that place. All the stone work, bridges, viaducts, and heavy jobs being finished, nothing of consequence remains but to lay the remaining rails. All the materials are on the ground, and the force on the road is at present about 700 men.

We congratulate those gentlemen in New-York and elsewhere, whose unshaken confidence in the work has enabled it to proceed. It has been demonstrated again and again to occupy a most important avenue to trade, and if it only secure the transportation and travel now existing, it will divide an annual interest of from 14 to 21 per cent. There is no mistake about this. The village of Ithaca and its vicinity already pays annually \$150,000 toll at Montezuma on merchandize and produce carried upon the canal.

The trade of that region is immense; 140 mills cluster within twelve miles of the village. Ithaca in fact is the key to the trade of the upper counties of the Susquehanna, and distributes salt, plaster, castings, and merchandize, to a great section of country in Pennsylvania. It receives lumber, (the finest that comes to this market,) produce and coal in large quantities, and will furnish an inexhaustible supply of fuel for the furnaces and salt works of our state. It commands the Baltimore, the Philadelphia, and New-York markets, and has an equal chance with the west for those of Canada. And here we may remark, that this portion of the state has arrived at its present prosperity *without* the fostering care of the legislature. While all other sections have from time to time, by expenditures in public works, by liberal endowments to public institutions, and multiplied acts of incorporation, been aided in their upward course, some fatality appears to have attended the applications from this quarter. They have been prejudged, or decided upon without a hearing, or have been overthrown by pitiful intrigues and jealousies unworthy of high minded legislation. The railroad has been made by the enterprise, almost termed folly, of a few individuals, in defiance of the sneers, if not the opposition, of those sagacious characters who always predict the ruin and downfall of every project not of their own creation. The tolls which will be received on these 13 miles of the road, even now, will at once be equal in amount to those received on any road of a similar extent in the United States.—[Albany Daily Advertiser.]

Report of the Engineer on the Survey for a Railroad between Richmond and Potomac Creek.

To Messrs. Lancaster, Denby & Co., F. & J. S. James, John H. Eustace, Edwin Porter, James Bosher, Merrit M. Robinson and others, subscribers to the Survey between Richmond and Potomac Creek:

GENTLEMEN—I have the honor to present you the following report on the surveys made under my direction, with a view to a railroad between the city of Richmond and the Potomac.

The line traced commences on Richmond Hill, near the Old Church. After passing around some ravines emptying into Shockoe creek, and near the Fairfield race course, it crosses, at station 70, the Mechanicsville turnpike; soon after which it descends into the valley of the Chickahominy, which it crosses a short distance above the junction of that stream and the Brooke. After crossing the Chickahominy, it passes around the head waters of the Totopotamoy, to station 247, at which point it crosses the stage road leading from Richmond to the Oaks. A few hundred yards farther it passes the Oaks, and is afterwards traced across some of the branches of the Machumps creek, and in the neighborhood of the road leading from the Oaks to the South Anna bridge. At station 321 it commences descending to the valley of the Pamunkey, which is passed about two hundred yards below the junction of the North and South Anna rivers.

From the valley of the Pamunkey, the line ascends at a graduation of thirty-three feet per mile, through the lands of Williams Carter and Doctor Morris, to the summit between the North Anna and Reedy Swamp. It is thence traced across several branches of Reedy Swamp through the lands of Messrs. Guy, Young, and Duling, to station 539, at which point it commences descending, on an uniform graduation of thirty-five feet per mile, to the valley of the Polecat river.

The summit between the Polecat and the Mattapony is passed with but little difficulty, the excavations and fillings in this distance being very moderate, and the grades, both ascending and descending, not exceeding thirty feet per mile.

From station 626, in the valley of the Mattapony, examinations have been made on two routes. The first line traced crosses the Mattapony a short distance beyond this point, and after passing on table land to the right of this stream, for about two miles, ascends on a graduation of thirty-one feet per mile, to the dividing ground between the Mattapony and Morocosac. Soon after attaining this level, it crosses the stage road between the Bowling Green and Fredericksburg, and is afterwards traced to the right of this, and in the neighborhood of the old court-house road, as far as Quisenbury's, which it passes about three-fourths of a mile to the left. From Quisenbury's it descends along the Ware creek to the Rappahannock flats, which are reached on the lands of Mr. William Taylor. From William Taylor's the line is taken along the flats, on ground generally favorable, to Fredericksburg.

The second line passes along the Mattapony Flats, on a nearly level graduation, to station 254, a few hundred yards above Downer's Bridge; after which it ascends, on a graduation for the greater part of the distance of thirty-two feet per mile, to the dividing ground between the Mattapony and Long Branch. From the summit, at station 174, near the head of Long Branch, it passes down the valley of Long Branch to the Massaponax, which is crossed about two hundred and fifty yards below the mouth of Furnace Run. About one and a half miles beyond this stream, it connects with the line above described.

To both of these lines objections may perhaps be made on local considerations, which

can probably be avoided on a definitive adjustment of the line. The line first traced has the recommendation of pointing directly to the Potomac; but its advantages in this respect would probably be deemed by a company more than counterbalanced by the consideration of making Fredericksburg a point in the main line of improvement, and the importance of avoiding a draw bridge at the Rappahannock. The estimate has therefore been made on the line last traced, by which the whole distance between Richmond and Fredericksburg would be sixty and a half miles.

Between the Rappahannock and Potomac, no examinations have been made with instruments, but a reconnoissance of the country shows two passes at which the dividing ground between these streams may be passed without material difficulty. The first of these is on the land of Mr. Pratt, near the head of Muddy creek, where a cut of moderate depth would admit of a line being afterwards taken, along one of the ravines of the Potomac creek, to the present steamboat landing. The second near the head of Lamb's creek would only be available for a line which should terminate on the Potomac, below the mouth of Potomac creek. Such a line would have the advantage of ending at a point which would afford much better water than can be had on the creek, and of course would admit of the use of a much larger class of steamboats and vessels on the Potomac, in connection with the railroad.

PLAN OF CONSTRUCTION AND ESTIMATE.—The principal difficulties on the line would consist of heavy cuts and fillings, and occasionally expensive constructions of masonry, or brick work, in situations where stone cannot be procured. It will probably be found advisable to adopt this substitute the whole distance between the Reedy Swamp and the head of Long Branch.

The superstructure of the railroad would be similar to that adopted on the railroad lately constructed between Petersburg and the Roanoke, except that white oak rails, plated with iron, are proposed, instead of yellow pine. This last material has been generally made use of on the railroads hitherto constructed in our country; but it has been found too soft and yielding to admit of the use of as heavy engines as it would be advantageous to employ. It is understood that a sufficient quantity of white oak timber may be obtained, on the line of the improvement, to admit of the superstructure in contemplation being executed within the terms of the estimates.

For more convenient consideration the cost of the work between Richmond and Fredericksburg is presented in four divisions, into which the line naturally divides itself.

DIVISION I.

Between the point of commencement and station 139, a short distance beyond the crossing of the Chickahominy, 7 miles.

ITEMS.	
Clearing - - - - -	\$ 100 00
Excavation, 119,335 cubic yards, averaged at 10 cents per yard	11,933 50
Embankment, 172,451 cubic yards, at 12 cents	20,694 12
Embankment, 42,266 cubic yards, at 15 cents	6,339 90
Masonry, of bridges and drains, 1763 perches, at \$5 per perch	8,815 00
Superstructure of bridges - - -	2,800 00
Railroad superstructure, 7 miles, at \$3000 per mile	21,000 00
	\$71,682 52

DIVISION II.

Between stations 139 and 388, near the south bank of the Pamunkey, 14 miles and 78 feet.

ITEMS.	
Clearing - - - - -	\$ 580 00
Excavation, 227,156 cubic yards, at 10 cents	22,715 60
Do. 220,581 cubic yards, at 13 cts.	28,675 53

Embankment, 251,364 cubic yards, at 12 cents	30,163 68
Do. 218,306 cubic yards, at 14 cts.	30,562 84
Masonry, 2769 perches, at \$5 50	15,229 50
Railroad superstructure, 14 miles and 78 feet, at \$3000 per mile	42,044 32

\$169,971 47

DIVISION III.

Between station 388 and station 626, near the Mattapony river, 13½ miles.

ITEMS.

Clearing - - - - -	\$ 350 00
Excavation, 500,426 cubic yards, averaged at 11 cents	55,046 86
Embankment, 336,474 cubic yards, averaged at 12 cents	40,376 88
Do. 68,504 cubic yards, averaged at 15 cents	10,275 60
Brick work of Bridges and Culverts.	
807,000 bricks, laid in lime mortar, at \$9	7,263 00
Masonry, 2660 perches, at \$4 50	11,970 00
Superstructure of bridges - - -	4,800 00
Railroad superstructure, 13½ miles, at \$3000 per mile	40,500 00

\$170,582 34

DIVISION IV.

Between station 626 and Fredericksburg, 28 miles and 82 feet.

ITEMS.

Clearing - - - - -	\$ 450 00
Graduation, including drains, 11½ miles of railroad, along the Mattapony flats, averaged at \$2400 per mile	28,000 00
Bridges across South river and Mattapony - - - - -	6,000 00
Excavation, 242,885 cubic yards, averaged at 10 cents	24,288 50
Embankment, 119,917 cubic yards, averaged at 11 cents	13,190 87
Do. 65,112 cubic yards, averaged at 15 cents	9,766 80
Brick work in Culverts and Drains.	
388,000 bricks, laid in lime mortar, at \$9	3,492 00
Masonry, 1910 perches, at \$4	7,640 00
Superstructure of bridge at Massaponax - - - - -	1,600 00
Railroad superstructure, 26 miles and 82 feet, at \$3000 per mile	78,046 60

\$172,474 77

SUMMARY.

Division I.	\$ 71,682 52
II.	169,971 47
III.	170,582 34
IV.	172,474 77
	\$584,711 10

Add for superintendence and contingencies ten per cent. - 58,471 11
Probable expenditure for depots, warehouses and water stations, and for locomotive engines, cars and carriages, - 120,000 00

Capital stock required for the railroad to Fredericksburg - \$763,182 21
As before observed, no survey has been made between Fredericksburg and the Potomac, and an accurate estimate cannot therefore be presented for this portion of the route, a bridge across the Rappahannock would probably cost \$20,000; and the distance by the way of Muddy creek, the nearest of the two routes, to the steamboat landing, may be computed at thirteen miles. Supposing the cost of this portion of the line to exceed, somewhat, the average expense of the railroad between Richmond and Fredericksburg, and a similar proportional expenditure to be necessary for locomotives, cars, &c. an increase of capital to the extent of \$200,000 would be necessary for the extension of the railroad to the Potomac.

The above aggregates will probably exceed the expectations which have been formed as

ADVOCATE OF INTERNAL IMPROVEMENTS.

to the cost of the work, but objects proportionably large would seem to justify its accomplishment. To the inhabitants of Richmond and Fredericksburg, it will afford a means of speedy intercommunication, by bringing them within a few hours transit of each other: to the intervening country a cheap and speedy transportation of its products, and to the portions of the state trading with Richmond and Fredericksburg, the benefit of improved markets. The execution of the work in question may also be expected in a few years to lead to that of lateral railroads along both branches of the Rappahannock, and in this aspect not only the rich counties at the foot of the Blue Ridge, but the Valley counties of the Shenandoah, Frederick, and Jefferson, seem to be particularly interested in its accomplishment.

But these results, important as they are, appear trivial compared with those which may be expected to ensue from the execution of the proposed work, if it should become the line of northern and southern travel. So far, this has been taken principally by packets plying between New-York and the southern ports. But the lines of railroads now progressing or executed in the northern states will have afforded, within two years from the present time, a steamboat and railroad communication between Boston and the Potomac, and the improvements projected in the south will have equally the effect of accumulating, on our southern border, a large and steadily increasing travel. It can scarcely be the policy of the legislature to direct this travel from the limits of the state, to place it on the bay. Unless this should be done, the proposed work, in connection with the Petersburg railroad, will have the effect of conducting it through the interior of the state, and of affording to the districts of the commonwealth, through which it will pass, as well as to the towns of Richmond, Fredericksburg and Petersburg, all the benefit which must necessarily result from positions on the great line of national thoroughfare.

That the work, under these circumstances, must be productive, there can be no doubt. It would seem, if the above views be correct, to be equally clear, that no work which has been projected in Virginia can be, in proportion to the expenditure which will be required for its completion, of more importance to the commonwealth, or have higher claims on its consideration and patronage. All which is respectfully submitted.

MONCURE ROBINSON, C. E.

Richmond, January 4th, 1834.

[From the London Courier, 14th Nov.]

It may be said of railroad projects, as it is sometimes said of other things, that "it never rains but it pours." No matter how far apart any two places may be, or whether the traffic between them be great or small, we are assured that to unite them by a railroad will be a highly profitable concern. We are further assured, that it is no great matter whether the line between them be level or not, seeing it has been opportunely discovered that an undulating line is preferable to one that is level. The success of Burns turned the heads of thousands of his countrymen, who fancied that because they could string together a few doggerel verses, they were rivaling the wit, and simplicity, and pathos, of the Ayshire bard. The success of the Manchester and Liverpool Railroad Company seems to have had a similar influence over the proprietors and speculators of this end of the island. But we are afraid there are not many of the newly-fledged schemes destined to make a nearer approach, in point of productiveness, to that prosperous concern, than the mass of his competitors did to Burns. Those, to whom the interest of their capital is any object would do well to pause and reflect seriously what they are about before embarking in any one of these schemes. Those who can afford to promote a public object, at the expense of their subscriptions, or who expect to gain more indirectly by the construction of the railroads

than the amount of their shares, are persons who may safely engage in such projects. Other parties will best consult their interests by confining their patronage to the risking of their bodies in the "fast coaches," when once they are set in motion.

It would be quite as logical to infer that because a £50 share in the Trent and Mersey Canal is worth £650, a share in the Croydon Canal should fetch a corresponding price, as it is to infer, from the success of the Manchester and Liverpool railroad, the success of the numberless schemes of the sort now before the public. We affirm, without fear of contradiction, that there are not within the British Empire any two places, 30 miles distant, between which a railroad can be made with half the chances of success as between Manchester and Liverpool. The latter is, in fact, the port of Manchester; and while the latter is the centre of the cotton manufacturing district, there is, within the single hundred in which it is situated, a population of 650,000! The intercourse between Manchester and Liverpool, before the railroad was so much as thought of, was vastly greater than that between any other two places in the Kingdom; and it must necessarily continue to increase, not only with the increased facilities of communication, but with the rapid growth of population, manufactures, and commerce, in that part of the country. In fact, looking at the Manchester and Liverpool railroad in an economical point of view, its moderate success is the only very striking feature about it. On the 23d of January last, the directors declared a half-yearly dividend at the rate of £4 4s. per cent. This amounted to £33,468 15s., leaving a surplus of only £693! In most concerns with which we are acquainted, this would be considered very improvident management. The railroad carriages, &c., have cost little less than a million; and they are very far certainly from being particularly durable. It is affirmed, no doubt, that the repairs which are constantly being made on the road and carriages, keep them uniformly up to the desired degree of goodness; and that, therefore, it is unnecessary to accumulate a sinking fund. But it is alleged by others that this is not really the case, and that at no very remote period a very large additional outlay will be required. Whether this be so we cannot pretend to affirm. But, taking the facts as they stand, and setting them in the most favorable point of view, they give slender encouragement to the projects now on foot. Here we have a railroad 30 miles in length, between two places having the greatest intercourse by far of any two in the empire, and because it pays eight per cent, we are told that we may all become as rich as Croesus by subscribing to railroads three, four, and five times the length, between places that have not a third, a fourth, or a fifth part of the intercourse between Manchester and Liverpool! We like quick travelling, and nothing would give us greater pleasure than to see the country intersected by railroads; and we do not mean to deny, that in a few cases they may be constructed with a view to the profit of the projectors or shareholders. But our love of rapid motion is not greater than our dislike of quackery and humbug. Let no one, who expects to profit by such schemes, put his faith in mere prospectuses.

IMPORTANT DISCOVERY.—A gentleman in this town believes he has discovered important improvements on the Burdenian plan of constructing steamboats, which he conceives will eventually supersede every other mode now in use. The improvements, it is thought, will combine every advantage of the Burden plan as to speed, and 1st, a great increase of strength—2d, a much less draft of water—3d, an adaptation to lake or river navigation, in deep, shallow, calm, rapid, or rough water—4th, an adaptation to the conveyance of passengers, or both freight and passengers, affording abundant room for the stowage of freight, which Mr. Burden's plan does not embrace—5th, an

increased facility in turning round—6th, a great diminution of cost in the construction. It is supposed that a boat on this plan may be built, which will run as fast as the boat built by Mr. Burden, having the same power of engine, and draw not more than one and a half or two feet of water. Should the sanguine expectations entertained of the value of the improvements, upon further consideration, prove well founded, a further notice will probably appear.—[Brockville Recorder.]

ANOTHER STEAMBOAT.—This is emphatically an age of steam inventions. New steamboats, steam-boilers, and steam-engines, greet us on every hand; and in this neighborhood there seems to be an astonishing fecundity in this respect.

Mr. Burden's wonder was long ago duly announced, and intelligence of it has been carried by the four winds to the four quarters of the globe. Not long since, some unknown friend sent us a paper printed in Ireland, containing an account of Mr. Burden's invention, originally given in this paper.

We have also noticed, upon the authority of others, Mr. Langdon's invention, and owe him an apology (which we find in the multiplied duties of the conductor of a daily paper), that we have not yet embraced his invitation to examine his boat.

Our object now is, as chroniclers in this region, to inform the public of another invention or model of a steamboat, which, being exhibited in this city, we had the pleasure of seeing on Tuesday. The plan is approved of by several prominent individuals in this city, who, besides, are connected with the present steamboat association, and who, we understand, design, (such is their confidence of its merits,) at no distant day, to reduce the invention to the test of experiment.

The model, which is remarkable for its simplicity and the absence of extra and unnecessary incumbrances, represents a boat 250 feet long, and 50 feet wide, composed or built upon two hulls (each 250 feet long) lying parallel to each other, and 20 feet apart in the centre.

The hulls are designed to be 10 feet deep, and 11 wide, with perpendicular sides, so that, at the same time they serve to buoy the boat, they supply two long and spacious cabins; which being below and not above the deck, will obviate the hindrances to speed, which boats having their cabins and a load of fixtures on deck, in certain states of wind and weather, sometimes experience.

The deck is arched, and in such a way, if not to present the full resistance and power of the perfect arch to the weight that may be placed upon it, yet so as in a great degree to strengthen the boat, and render it fully adequate to the uses for which it is designed.

The sides and bottom of the hulls, where they come in contact with the water, are constructed on a line purely designed to diminish resistance, and forming the segment of a circle of an immense diameter.

The boat is to be propelled by a single paddle-wheel of great power, revolving in the centre between the hulls.

The inventor is a young man of this city, of promise and ingenuity, and the present evidence of it is not the first the public has to judge from. His profession and calling have given him opportunities of observation, and of studying the subject of improvements in the application and use of steam and steamboats, which few others have had, and which, with a laudable ambition, he has endeavored to improve for the benefit of the public, and we hope of himself also.

It is also intended to introduce a coal-boiler, constructed on a new principle, the effect of which, it is assumed by those acquainted with the subject, (which we profess not to be,) will be the saving of at least 50 per cent. in the expense of fuel.

To construct a boat 250 feet long, it is estimated will cost \$30,000.

The hulls will be framed upon light but strong timbers, upon which are to be fastened successive layers of thin tough oak plank, or boards. The first layer to run horizontally lengthwise the boat; the second crosswise; the third crosswise diagonally; and the fourth lengthwise; the whole fastened or riveted together, by iron nails or rivets, and to constitute a thickness not exceeding four inches: forming, in short, a kind of medium between boats built on the plan of Mr Annesley and common boat building.—[Troy Press.]

RAILROAD MEETING.—At a large and respectable meeting of citizens, from the several towns of Orange county, held at the Orange Hotel, in the village of Newburgh, on the 11th February, 1834, for the purpose of considering the propriety of petitioning the legislature for aid in the construction of the New-York and Erie Railroad, the hon. Nathaniel Jones, of Warwick, was elected President; Abraham M. Smith, Esq. of Newburgh, was chosen Vice-President, and Edward Blake, of Montgomery, and Robert Sly, of New-Windsor, were appointed Secretaries.

David Ruggles, Esq., after addressing the meeting, moved that a committee be appointed to draft a memorial to the legislature, upon the subject for the consideration of which the meeting was assembled. The meeting was also addressed by Isaac R. Van Duzer, Samuel J. Wilkin, Charles Borland, John Hallock, Jun., William W. Brooks, and Abraham Crist, Esqrs. upon the importance to the state of New-York of the subject under consideration; whereupon, David Ruggles, of Newburgh, Isaac R. Van Duzer, of Goshen, Charles Borland, of Montgomery, William W. Brooks, of Blooming-Grove, John B. Booth, of Goshen, John Hallock, Jun., of Minisink, and Abraham Crist, of Walden, were appointed a committee to prepare a memorial to the legislature, for their aid and encouragement in constructing the said railroad.

The committee having consulted together, reported a memorial to the legislature, which was unanimously adopted.

RAILROADS IN GEORGIA.—Companies have been incorporated by the Legislature of Georgia to construct three Railroads in that state; one from Savannah to Macon; one from Macon to Forsyth, and one from Augusta westwardly.—It is required by these charters that these roads shall be commenced within two years of the passage of the act, and shall be completed within six years thereafter.

BUSINESS OF THE CANAL.—We have been politely furnished with the following return by Gen. Humphrey, canal collector in this city:

The whole quantity of down freight upon which toll is charged by weight, that was conveyed on the New-York canals to Albany, in 1833, amounts to one hundred and fifty-two thousand nine hundred and thirty-five tons, at 2000 pounds per ton, viz.:

Barrels of flour.....	734,133
" ashes.....	22,922
" provisions.....	13,439
" whiskey.....	19,908
Hogsheads do.....	873
Bushels of salt.....	17,116
" wheat.....	293,504
" coarse grain.....	122,944
" barley.....	257,252
Boxes of glass.....	2,187

Also, the following, upon which toll is not charged by the ton:

Cords of wood.....	20,960
Feet of timber.....	74,350
" lumber.....	55,333,547
M. of shingles.....	74,350

There were 68,321 tons of merchandise, furniture and sundries, sent up the canal from Albany.

The whole amount of tolls received by the collector at Albany is \$323,689 83, making an increase of \$37,053 56 over the receipts of the last year.

Number of boats arrived and cleared, 16,834.

PRODUCE AND COAL IN PHILADELPHIA.—The following statement exhibits the number of bushels of grain, salt, (coastwise,) and coal, discharged at the port of Philadelphia for the years

	1832.	1833.
Corn.....bushels	631,098½	629,654
Wheat.....ditto	232,831½	156,255½
Rye.....ditto	39,608	77,302½
Barley.....ditto	55,508½	45,760½
Oats.....ditto	95,329	93,434½
Flaxseed.....ditto	5,204½	9,890½
Beans and Peas.....ditto	1,414½	378
Clover-seed.....ditto	575	—
Salt.....ditto	114,378	63,971½
Coal.....ditto	142,754	180,145

Flour Inspection.—Amount of flour and meal inspected for the port of Philadelphia, for the year ending 31st Dec. 1833:

Wheat Flour.....	378,590 barrels.
Ditto.....	22,725 hf. ditto.
Rye Flour.....	40,011 barrels.
Corn Meal.....	40,415 ditto.
Ditto.....	7,549 hds.
Middlings.....	2,597 barrels.

Inspection of Salt Provisions, in the city and county of Philadelphia, for the year 1833:

3,123 barrels of beef.
508 hf. bbls. ditto.
6,765 hds. of pork.
69 hf. bbls. ditto.
53 bbls. of herring.

10,518.

WONDERS OF ART.—You behold a majestic vessel bounding over the billows from the other side of the globe; easily fashioned to float with safety over the bottomless sea; to spread out her broad wings, and catch the midnight breeze, guided by a slow drowsy sailor at the helm, with two or three companions reclining listlessly on the deck, gazing into the depths of the starry heavens. The commander of this vessel, not surpassing thousands of his brethren in intelligence and skill, knows how, by pointing his glass at the heavens, and taking an observation of the stars, and turning over the leaves of his "Practical Navigator," and making a few figures on his slate, to tell the spot which his vessel has reached on the trackless sea; and he can also tell it by means of a steel spring and a few brass wheels, put together in the shape of a chronometer. The glass with which he brings the heavens down to the earth, and by which he measures the twenty-one thousand six hundredth part of their circuit, is made of a quantity of flint, sand, and alkali—coarse opaque substances, which he has melted together into the beautiful medium, which excludes the air and the rain and admits the light,—by means of which he can count the orders of animated nature in a dew-drop, and measure the depth of the vallies in the moon. He has, running up and down his main mast, an iron chain, fabricated at home, by a wonderful succession of mechanical contrivances, out of a rock brought from deep caverns in the earth, and which has the power of conducting the lightning harmlessly down the sides of the vessel into the deep. He does not creep timidly along from headland to headland, nor guide his course along a narrow sea, by the north star; but he launches bravely on the pathless and bottomless deep, and carries about with him in a box a faithful little pilot, who watches when the eye of man droops with fatigue, a small and patient steersman, whom darkness does not blind, nor the storm drive from his post, and who points from the other side of the globe,—through the convex earth,—to the steady pole. If he falls in with a pirate he does not wait to repel him, hand to hand; but he puts into a mighty engine a handful of dark

powder, into which he has condensed an immense quantity of elastic air, and which, when it is touched by a spark of fire, will instantly expand into its original volume, and drive an artificial thunderbolt before it, against the distant enemy. When he meets another similar vessel on the sea, homeward bound from a like excursion to his own, he makes a few black marks on a piece of paper and sends it home, a distance of ten thousand miles; and thereby speaks to his employer, to his family, and his friends, as distinctly and significantly as if they were seated by his side. At the cost of half the labor with which the savage procures himself the skin of a wild beast, to cover his nakedness, this child of civilized life has provided himself with the most substantial, curious, and convenient clothing, textures and tissues of wool, cotton, linen, and silk, the contributions of the four quarters of the globe, and of every kingdom of nature. To fill a vacant hour, or dispel a gathering cloud from his spirits, he has curious instruments of music, which speak another language of new and strange significance to his heart; which make his veins thrill, and his eyes overflow with tears, without the utterance of a word—and with one sweet succession of harmonious sounds, send his heart back, over the waste of waters, to the distant home, where his wife and his children sit around the fire-side, trembling at the thought that the storm which beats upon the windows, may, perhaps overtake their beloved voyager on the distant seas. And in his cabin, he has a library of volumes—the strange production of a machine of almost magical powers—which, as he turns over their leaves, enable him to converse with the great and good of every clime and age, and which even repeat to him, in audible notes, the laws of his God, and the promise of his Saviour, and point out to him that happy land which he hopes to reach when his flag is struck, and his sails are furled, and the voyage of life is over.—[E. Everett.]

RAIN WATER.—In our country there falls rain, including melted snow, to the average depth of 35 inches. On a surface forty feet square, there falls yearly 34,909 wine gallons; and if all this were secured in cisterns, there would be nearly one hundred gallons for every day's consumption, or about three barrels. This water, if well preserved, would be the very purest and best for most domestic purposes. The horse and the cow prefer rain water to pump or well water; and though it would not be entirely governed by their decision, yet great respect is due to their judgment in such matters. The water of many wells is tainted in such a way as to make it less fit for a solvent; and it does not so perfectly combine with nutritious substances, to form kyle, and nourish the human system. They who live in situations where water is not easily procured from the ground, may be told that the purest water is descending around them; and if they will only be at the necessary expense to secure this gift of heaven, they may provide an abundant supply. On such reservoirs the inhabitants of Palestine placed much dependence; and it is a merciful appointment of God, that in warm countries, where the greatest supply of water is needed, the most rain descends. We may yet find good capacious cisterns, of brick or stone, and Roman cement, economical additions to our do-

mestic conveniences. A cistern ten feet square, and ten feet deep, would contain 118 hogsheads of 63 wine gallons each, and would secure to most families a constant supply of water.—[Scientific Tracts and Lyceums.]

THE CHEAP TRANSPORTATION OF BOOKS AND PERIODICALS.—The present state of society demands a cheap system of conveyance for the diffusion of knowledge. The post-office system is too expensive. On this system conveyance must be more expensive, from its rapidity, than is necessary for all purposes. A vast number of publications now issued are not required to be transmitted with great speed. As mail stages now usually run, they carry a load of one thousand pounds at three times the expense of conveying the same load at a moderate rate. "In England," says the Scientific Tract on Railroads, "every coach on the best roads that runs for twenty-four hours, at nine miles per hour, drawing not over two tons, requires no less than 180 horses, or ninety each way. Less than 12 horses would carry the same weight for the same time, at two and a half miles per hour." In the mail stages of our country, weighing about a ton, less than a ton of passengers and baggage is usually carried. To transport this load at the rate ordinarily travelled, the horses are changed every twelve miles. To carry the load, therefore, thirty-six miles, twelve horses are needed. At the rate of four miles an hour, four horses would transport this load in waggons. At a moderate speed, therefore, a load of magazines and books would be conveyed at one third the cost of transportation by rapid mail stages. But there is no advantage in my having many of the periodicals I receive by a rapid conveyance. A system of baggage waggons, transporting small articles over the country at a cheap rate, would, therefore, greatly facilitate the diffusion of knowledge. I wish to take the Biblical Repository, and find that four numbers weigh two pounds and ten ounces. I live rather more than 100 miles from Boston; and the postage of the whole, comprising 50 sheets, would be \$1.25; while the freight, at the rate at which goods are commonly transported in waggons, would be a little less than 2½ cents. The postage of forty numbers of the Temperance Recorder would be 60 cents; while the freight of the whole 40, if the papers were dried, and thus made light, would not be more than one cent. When the post-office was established there did not exist such a periodical literature as distinguishes the present age; and therefore, the United States did not provide for such a conveyance of packets as is now needed. The law now in force, passed March, 1827, enacts, "That no person, other than the Postmaster General, or his authorized agents, shall set up any foot or horse post for the conveyance of letters and packets upon any post road, which is or may be established as such by law." This law forbids such a system of conveyance of parcels as is contemplated in this article, unless it should be established by the post-office department. But if it should not be thus established, it may be authorised by act of Congress. Why should booksellers and printers, and publishers, be shackled in their business more than other classes of the community? A vast amount of the literature of the country is now periodical. We

have our weeklies, our monthlies, our quarterlies, and our annuals, without number. We have our libraries too; the Christian's Library, the Select Circulating Library, and a variety of others. It is desirable that there should be a regular and cheap conveyance of such books. This difficulty of distributing periodicals over the country is of the nature of a heavy duty on them. The postage on a periodical, which does not convey news, and needs not to be carried post haste, now greatly increases its cost, and checks its circulation. If shoes, and hats, and other articles of manufacture, could be conveyed only by government lines, at the cost of 33 per cent. on their value, the manufacturers would be exceedingly embarrassed; and the public, too, would be injured beyond calculation, especially if the manufacture could be carried on only in one place in a whole county, or in a whole state, as is the case with books and periodicals.—[Scientific Tracts and Lyceums.]

THE FLOATING GARDENS OF CASHMERE.—The city of Cashmere, being the capital of the province of that name in Asia, is situated in the midst of numerous lakes, connected with each other, and with the river Vedusta, by canals, separated by narrow lines and insulated plots of ground. Upon these lakes are floating gardens, cut off generally from the body of the lake by a belt of reeds; the cultivation of which is not only very singular, but highly profitable, and worthy of imitation in Europe as a resource for raising food for man. The second number of the Journal of the Geographical Society contains a notice of the Natural Productions and Agriculture of Cashmere, from which the following account is compiled:

The city of Cashmere is subject to considerable inundations, which have become annually more frequent, through the neglect of the government in not checking the accumulation of weeds and mud, which diminish the depth, and consequently increase the surface of the lakes. This has suggested the expediency of a floating support, by which vegetables are cultivated in safety, deriving as much moisture as is beneficial without the risk of being destroyed. Various aquatic plants spring from the bottom of the lakes, as water lilies, sedges, reeds, &c.; and as the boats which traverse those waters take generally the shortest lines they can pursue to their destination, the lakes are in some parts cut into avenues, as it were, separated by beds of sedges and reeds. Here the farmer establishes his cucumber and melon floats by cutting off the roots of the aquatic plants about two feet under water, so that they completely lose all connection with the bottom of the lake, but retain their situation in respect to each other. When thus detached from the soil, they are pressed into somewhat closer contact, and formed into long beds of about two yards breadth. The heads of the sedges, reeds, and other plants of the float, are next cut off, and laid upon its surface, and covered with a thin coat of mud, which, at first interrupted in its descent, gradually sinks into the mass of matted stalks. The bed floats, but is kept in its place by a stake of willow driven through it at each end, which admits of its rising and falling in accommodation to the rise and fall of the water. By means of a long pole thrust among the reeds, at the bottom of the lake, from the side of a boat, and turned round several times, a quantity of plants are torn off from the bottom, and carried in the boat to the platform, where the weeds are twisted into conical mounds, about two feet in diameter at their base, and of the same height, terminating at the top in a hollow, which is filled with fresh soft mud, and sometimes wood ashes. The farmer has in preparation a number of cucumber and melon plants, raised under mats, and of these, when they have four leaves, he places three plants in the basin of every cone or mound, of

which a double row runs along the edge of every bed, at about two feet distance from each other. No further care is necessary except that of collecting the fruit, and the expense of preparing the platforms and cones is very trifling. Mr. Moorcroft traversed about fifty acres of these floating gardens, growing cucumbers and melons, and saw not above half a dozen unhealthy plants; and he says, he never saw in the cucumber and melon grounds, in the vicinity of populous cities in Europe or in Asia, so large an expanse of plant in a state of equal health or luxuriance of growth. The general depth of the floating beds is about two feet, and some of them are seven feet broad. The season lasts for three months and a half, beginning in June. From the first setting of the fruit to the time of pulling, seven or eight days are the ordinary period. Thirty full-sized fruit from each plant, or from ninety to a hundred from each cone, are the average crops. The seed of the melon is brought annually from Baltistan, and the first year yields fruit of from four to ten pounds each in weight; but if the seed be re-sown, the produce of the second year exceeds not from two to three pounds. Unless when eaten to great excess the melon produces no disorders, and it is remarked that healthy people who live upon this fruit during the season become very speedily fat; and the effect upon horses fed upon this fruit is reported to be the same. In the early part of the season, cucumbers of full size sell at the rate of about three for a piece of coin of the value of a half-penny; but as the weather becomes hotter, and the plants get into full bearing, ten, fifteen, and even twenty, are purchased for this price. It is calculated that every cone yields a money return of about eighteen pence. Allowing sixpence for labor of every description, and including also the tax, the clear profit is a shilling for every two square yards. The yield of the melons numerically less, but the return of profit is at least equal. "No other vegetables are raised upon the spaces between the cones, although Mr. Moorcroft thinks that onions, cresses, and other useful vegetables, might be raised upon them; and water-mint grows spontaneously upon the floats.

Cashmere, or Cassimere, is one of the northern provinces of India within the Ganges. It is surrounded by mountains, and from its beauty and fertility has been called the Paradise of the Indies. It contains upwards of 100,000 villages, is well stocked with cattle and game, and is said to be unmolested by beasts of prey. The people are ingenious, and resemble the Europeans in their persons, and the women are fair and tall. The famous Cashmere shawls derive their name from this country, though at present the supply that actually comes from it is comparatively small.

WHITE MONKEY.—A letter from Ramree of the 15th April, 1827, makes mention of a perfectly white monkey that had been caught there. The hair on the animal's body was white, curly, and soft as silk, and excited great wonder and admiration among the natives. They represented that such a creature had never but once, to their knowledge, been seen in those parts, and that the king of Ava sent down a golden cage, with a host of people, to escort the animal to his presence, and expended besides 20,000 rupers in sacrifices and public rejoicings, auguring from the arrival of the extraordinary stranger, the most happy presages of good fortune. The monkey brought to our correspondent was one of the same description, but unfortunately it was too young and tender an age when caught. A Burmese woman, who was nursing an infant of her own, requested permission to suckle it, and fairly divided her maternal attention between the two. Pug lived in apparent good health and spirits for six days, but whether it was that its nursing disagreed with it, or that it was naturally very delicate, it died on the seventh day.—[Mr. E. G. Ballard, Islington, in the Field Naturalist's Magazine, No. 9.]

On the Microscope—Method of Constructing, &c. [From Partington's British Cyclopaedia.]

[Continued from page 71.]

Another still more simple mode of effecting the same object is shown beneath:

The lantern is provided with a sliding tube for the introduction of the objects to be magnified. The moveable lenses are shown at *a*. Other objects differing in their character may be placed in the forceps, *b*, attached to the sliding frame by the plate *c*. A plate of ground glass, shown at *d*, serves to receive the figure of the object.

The mode of constructing the solar microscope may now be illustrated.

It is shown in its simplest form in the engraving below, in which *a b* is the diago-

nal mirror for receiving the rays of light, *p q r s t u v*. They are reflected by the polished surface, and thrown on the lens *c d*. Within the focus, at *e f*, is placed any transparent object to be magnified, and the image thus illuminated passes through the lens *g h*. The size of the magnified figure, *i k*, will depend on the distance the instrument is placed from the wall *l m*. The room should be darkened, which is usually effected by employing a large shutter at *n o*. Mr. Baker, speaking of this instrument, says, "that it has conveniences attending it which no other microscope can have: for the weakest eyes may use it without the least straining or fatigue. Numbers of people together may view any object at the same time, and by pointing to the particular parts thereof, and discoursing on what lies before them, may be able better to understand one another, and more likely to find out the truth, than in other microscopes, where they must peep one after another, and perhaps see the object neither in the same light nor in the same position. Those, also, who have no skill in drawing, may by this contrivance easily sketch out the exact figure of any object they have a mind to preserve a picture of, since they need only fasten a paper on the screen, and trace it out thereon, either with a pen or pencil, as it appears before them. It is worth the while of those who are desirous of taking many draughts in any way, to get a frame, in which a sheet of paper may be placed or taken out at pleasure; for, if the paper be single, the image

of an object will be seen almost as plainly on the back as on the fore side; and, by standing behind the screen, the shade of the hand will not obstruct the light in drawing, as it must in some degree when one stands before it."

A valuable solar microscope of the most perfect form is annexed.

The square plate *b c d* is attached to the window-shutter by the screws *e f*. The glass plate *g* is mounted in a brass frame, and may be elevated or depressed by a screw at *d*. A rotatory motion is communicated by a pinion and handle at *c*, which acts on a large wheel concealed by the square plate. The first lens is placed in the tube *a*, immediately adjoining the mirror. Another tube *m* is attached by a screw at *n*, and contains two small lenses, and the rack-work, *k l*, for adjusting the focus of the instrument. The objects are introduced at *i*; those best fitted for exhibition are the wings of insects, and the cuttings of wood. When glasses of high power are employed at *h*, they are now constructed on the achromatic principle.

We may now proceed to furnish our readers with some necessary particulars respecting the method of using microscopes. On this, Mr. Adams, in his *Essay on the Microscope*, has been very copious; with a view, as he informs us, to remove the common complaint made by Mr. Baker, "that many of those who purchase microscopes are so little acquainted with their general and extensive usefulness, and so much at a loss for objects to examine by them, that after diverting their friends some few times with what they find in the sliders which generally accompany the instrument, or perhaps with two or three common objects, the microscope is laid aside as of little further value; whereas, no instrument has yet appeared in the world capable of affording so constant, various, and satisfactory an entertainment to the mind."

In using the microscope there are three things necessary to be considered. 1. The preparation and adjustment of the instrument itself. 2. The proper quantity of light, and the best method of adapting it to the object. 3. The method of preparing the objects, so that their texture may be properly understood.

With regard to the microscope itself, the first thing necessary to be examined is, whether the glasses be clean or not: if they are not so, they must be wiped with a piece of soft leather, taking care not to soil them afterwards with the fingers; and, in replacing them, care must be taken not to place them in an oblique direction. We must likewise be careful not to let the breath fall upon the glasses, nor to hold that part of the body of the instrument where the glasses are placed with a warm hand; because the moisture thus expelled by the heat from the

metal will condense upon the glass, and prevent the object from being distinctly seen. The object should be brought as near the centre of the field of view as possible, for there only will it be exhibited in the greatest perfection. The eye should be moved up and down from the eye-glass of a compound microscope, till the situation is found where the largest field and most distinct view of the object are to be had, but every person ought to adjust the microscope to his own eye, and not depend upon the situation it was placed in by another. A small magnifying power should always be begun with, by which means the observer will best obtain an exact idea of the situation and connection of the whole, and will of consequence be less liable to form any erroneous opinion, when the parts are viewed separately by a lens of greater power. Objects should also be examined first in their most natural position; for, if this be not attended to, we shall be apt to form very erroneous ideas of the structure of the whole, as well as of the connection and use of the parts. A living animal ought to be as little hurt or decomposed as possible. From viewing an object properly we may acquire a knowledge of its nature; but this cannot be done without an extensive knowledge of the subject, much patience and many experiments; as in a great number of cases the images will resemble each other, though derived from very different substances. Mr. Baker, therefore, advises us not to form an opinion too suddenly after viewing a microscopical object; nor to draw our inferences till after repeated experiment and examinations of the objects in many different lights and positions; to pass no judgment upon things extended by force, or contracted by dryness, or in any manner out of a natural state, without making suitable allowances. The true color of objects cannot be properly determined by very great magnifiers; for, as the pores and interstices of an object are enlarged according to the magnifying power of the glasses made use of, the component particles of its substance will appear separated many thousand times further asunder than they do to the naked eye: hence the reflection of the light from these particles will be very different, and exhibit different colors. It is likewise somewhat difficult to observe opaque objects; and as the apertures of the larger magnifiers are but small, they are not proper for the purpose. If an object be so very opaque that no light will pass through it, as much as possible must be thrown upon the upper surface of it. Some consideration is likewise necessary in forming a judgment of the motion of living creatures, or even of fluids, when seen through the microscope; for, as the moving body, and the space wherein it moves, are magnified, the motion will also be increased.

On the management of the light depends, in a great measure, the distinctness of the vision; and as, in order to have this in the greatest perfection, we must adapt the quantity of light to the nature of the object, and the focus of the magnifier, it is therefore necessary to view it in various degrees of light. In some objects it is difficult to distinguish between a prominence and a depression, a shadow and a black stain; or between a reflection of light and whiteness, which is particularly observable in the eye of the libella, and other flies, all of these

appearing very different in one position from what they do in another. The brightness of an object likewise depends on the quantity of light, the distinctness of vision, and on regulating the quantity to the object; for one will be in a manner lost in a quantity of light scarcely sufficient to render another visible.

There are various ways in which a strong light may be thrown upon objects, as by means of the sun and a convex lens. For this purpose the microscope is to be placed about three feet from a southern window; then take a deep convex lens, mounted on a semi-circle and stand, so that its position may easily be varied; place this lens between the object and the window, so that it may collect a considerable number of rays, and refract them on the object or the mirror of the microscope. If the light thus collected from the sun be too powerful, it may be lessened by placing a piece of oiled paper, or a piece of glass slightly ground, between the object and lens. Thus a proper degree of light may be obtained, and diffused equally over the surface of an object, a circumstance which ought to be particularly attended to; for if the light be thrown irregularly upon it, no distinct view can be obtained.

On account of the sun's motion, and the variable state of the atmosphere, solar observations are rendered both tedious and inconvenient, so that it may be advisable for the observer to be furnished with a large tin lantern, formed something like the common magic lantern, capable of containing an argand lamp. There ought to be an aperture in the front of the lantern, which may be moved up and down, and be capable of holding a lens, by which means a pleasant and uniform as well as strong light may easily be obtained. The lamp should likewise move on a rod, so that it may be easily raised or depressed. A weak light is best fitted for viewing many transparent objects, among which we may reckon the prepared eyes of flies, as well as the animalculæ in fluids. The quantity of light from a lamp or candle may be lessened by removing the microscope to a greater distance from them, or by diminishing the strength of the light which falls upon the objects. This may very conveniently be done by pieces of black paper with circular apertures of different sizes, and placing a larger or smaller one upon the reflecting mirror, as occasion may require. The light of a lamp or candle is generally better for viewing microscopic objects than day-light, it being more easy to modify the former than the latter, and to throw it upon the object with different degrees of intensity.

With regard to the preparation of objects, Swammerdam has, in that respect, excelled almost all other investigators who either preceded or have succeeded him. He was so assiduous and indefatigable, that neither difficulty nor disappointment could make the least impression on him; and he never abandoned the pursuit of any object until he had obtained a satisfactory acquaintance with it. Unfortunately, however, the methods he made use of in preparing his objects for the microscope are now entirely unknown.

For dissecting small insects, Swammerdam had a brass table, to which were attached two brass arms, moveable at pleasure. The upper part of each of these vertical arms was constructed in such a manner as

to have a slow vertical motion, by which means the operator could readily alter their height. One of these arms was to hold the minute objects, and the other to apply the microscope.

The lenses of Swammerdam's microscopes were of various sizes as well as foci. His observations were always begun with the smallest magnifiers, from which he proceeded by progressive steps to the greatest.

The minute scales or feathers which cover the wings of moths or butterflies afford very beautiful objects for the microscope. Those from one part of the wing frequently differ in shape from such as are taken from other parts; and near the thorax, shoulder, and on the fringes of the wings, we generally meet with hair instead of scales. The whole may be brushed off the wing upon a piece of paper, by means of a camel's hair pencil; after which the hairs can be separated, with the assistance of a common magnifying glass.

Great difficulty is experienced in dissecting properly the proboscis of insects, such as that of the gnat, and the experiment must be repeated a great number of times before the structure and situation of the parts can be thoroughly investigated, as the observer will frequently discover in one what he could not in another. The collector of the bee, which forms an exceedingly curious object, ought to be carefully washed in spirit of turpentine, by which means it will be freed from the unctuous matter adhering to it; when dry, it is again to be washed with a camel's hair pencil, to disengage and bring forward the small hairs which form part of its microscopic beauty. The best method of preparing the stings of insects, which are in danger of being broken, from their hardness, is to soak the case and the rest of the apparatus for some time in spirit of wine or turpentine; then lay them on a piece of paper, and with a blunt knife draw out the sting, holding the sheath with the nail of the finger, or any other blunt instrument; but great care is necessary to preserve the feelers, which, when cleaned, add much to the beauty of the object. The beard of the *lepas antifer* is to be soaked in clean soft water, frequently brushing it while wet with a camel's hair pencil; after it is dried, the brushing must be repeated with a dry pencil, to disengage and separate the hairs, which are apt to adhere together.

The eyes of insects in general form very beautiful and curious objects. Those of the libellula and other flies, as well as of the lobster, &c. must be cleaned from the blood, &c. after which they should be soaked in water for some days: one or two skins are then to be separated from the eye, which would be otherwise too opaque and confused; but some care is requisite in this operation, for, if the skin be rendered too thin, it is impossible to form a proper idea of the organization of the part. In some substances, however, the organization is such that by altering the texture of the part, we destroy the objects which we wish to observe. Of this sort are the nerves, tendons, and muscular fibres, many of which are viewed to most advantage when floating in some transparent fluid. Thus very few of the muscular fibres can be discovered when we attempt to view them in the open air, though great numbers may be seen if they be placed in water or oil. By viewing the

thread of a ligament in this manner we find it composed of a vast number of smooth round threads lying close together. Elastic objects should be pulled or stretched out while they are under the microscope, that the texture and nature of those parts, the figure of which is altered by being thus extended, may be more fully discovered.

To examine bones by the microscope, they should first be viewed as opaque objects; but afterwards, by procuring thin slices of them, they may be viewed as transparent. The sections should be cut in all directions, and well washed and cleaned; and, in some cases, maceration will be useful, or the bones may be heated to a high temperature, in a clear fire, which will render the bony cells more conspicuous.

AGRICULTURE, &c.

[From the New-York Farmer.]

CULTIVATING THE MULBERRY.—The following, we believe, is from "Goodsell's Genesee Farmer":

So well are we satisfied with the result of our experiments, and that it is unnecessary to go through with all the routine of first sowing the seed in beds, and then transplanting the trees from the seed bed to the nursery, and from there to the orchard, then to wait for them to become firmly rooted, and to expand their tops, before worms can be fed from them, that we design next spring to sow another pound of seed, from which we hope to raise from eighty to one hundred thousand trees, from which to feed from until our orchard shall arrive at maturity, and ultimately to transplant the young trees into hedges, which for large establishments are no doubt preferable to standard trees, as it facilitates the gathering of leaves, and renders the whole less expensive. We are fully confident that every seedling tree one year old is capable of furnishing food for one worm, or producing one cocoon; if so, the greatest obstacle to the immediate introduction of this branch of domestic manufacture is removed, and instead of waiting many years, and incurring heavy expenses in the cultivation of trees, before the manufacture of silk can be commenced, or any returns had from the investment, it requires no more time than is necessary to clear off a piece of land, and obtain a crop of wheat, and we are satisfied that the same labor bestowed will yield a richer harvest. I am, sir, yours, &c.

EDWIN STANLEY.

Adams' Basin, Nov. 12, 1833.

HOPS.—A gentleman from Germany informs us that American hops have been tried in that country and obtained a decided preference to the English; and that an increased demand from that quarter may be looked for hereafter.—[N. Y. Shipping List.]

A METHOD OF REARING EARLY PEAS AND OTHER VEGETABLES.—An English gardener states that "the method of rearing peas in pots and boxes, in hot-beds and hot-houses, and afterwards transplanting them out into open ground, is a common practice with gardeners, and often succeeds very well, particularly if they are not too long in transplanting them; but I would recommend a method not so well known, as far preferable to that of pots and boxes, particularly when they are to be raised in a hot bed. This consists in having a quantity of turf cut in pieces, of about nine or ten inches long, and three or four broad, which are placed in a regular manner over the surface of the hot-bed, grass side downwards, and a row of peas is sown upon each row of turf, and afterwards covered with soil; when they are fit for transplanting, no more is required than to lift out the turf, piece by piece, with the peas

growing upon it, and place them where they are to produce their crop. By this means the roots receive no injury, nor do the plants sustain the least check in transplanting. This method may be practised with similar success in the raising of potatoes, beans, &c."

Culture of the Mulberry. By the Editor.

The White Mulberry, *Morus alba*, a native of Asia, was introduced into Italy by the survivors of the last crusade. It was cultivated extensively in that country, and early in the sixteenth century carried into France. This is the species principally cultivated in the United States for feeding the silk-worm.

SOWING AND TRANSPLANTING.—It can be propagated by seeds, cuttings, layers, or suckers. The seed, which may be obtained at any respectable seed-store, should be fresh and plump. Choose a rich piece of ground, and, if convenient, a sheltered situation in the garden. Let it be well dug and pulverised with the spade. Sow the seed the latter part of April, or early in May, in drills from eight to twelve inches apart, and cover them to the depth of half an inch, working the soil with a spade, hoe, or roller. In ten or twelve days the young plants will begin to make their appearance above ground. By soaking the seed some twenty-four hours before sowing, in rain water, their vegetation may be hastened. The young plants should be kept free from weeds, and occasionally hoed between the drills. If too thick, they should be thinned when about three or four inches high, by taking some of them up with a dibber, or a chisel-shape board, leaving the remainder near a foot apart. If this is not done in a rainy day, the drills or rows should be well watered, that the young plants may be taken up with as much earth adhering as possible, and kept in a moist state until they are transplanted into fresh dug earth. If the tap root is cut off, when they are raised, it saves handling.

In the fall, before the plants cease growing, cut off the long tap roots of those that have not been transplanted, by thrusting into the ground a sharp spade, care being taken not to cut them off too short. Those that have had a vigorous growth may, if more convenient, be transplanted into their permanent places in the fall, or succeeding spring. Generally, however, it is recommended to transplant them into a nursery, in rows fifteen to twenty inches apart, where they remain to obtain the growth one, two, or three seasons. Whenever they are removed from the seed beds, or from the nursery, much care should be taken to preserve the soil around the roots, that the fibres may not be injured, or exposed to the sun or dry air. The soil where they are intended to remain permanently should be rich and well pulverised.

When intended for hedges, they are taken from the seed beds after the first season's growth, cut down to about six inches, and then set out in the hedge rows. If cattle are kept from the hedge for three or four years, they will make it grow the thicker by browsing the limbs.

The seeds are sometimes sown in the fall, immediately after ripening. If the winter is mild and uniform, they will succeed, and thus enable the grower to gain the greater part of the season.

One ounce of seed should, if good, produce from five to ten thousand seedling plants.

The proper soil for the mulberry is that free from excess of moisture: a dry, sandy, or stony piece of ground produces leaves congenial to the health of the worm, and productive of good silk.

CUTTINGS AND LAYERS.—Even the first spring after the seed has been sown, the plants will supply wood sufficiently ripened for a large number of cuttings. They should be from five or six to ten or twelve inches long, and put in the ground nearly half their length. A soil retentive of moisture, and made pretty rich with fermented, particularly cow manure, and in a situation rather shady than otherwise, adds much to the certainty of the success of the cut-

tings. They may be put at distances most convenient for the grower; in rows that will enable him to hoe them. If the weather, before they are well rooted, be dry, they should be frequently watered.

The white mulberry is also propagated by layers, by bending those limbs nearest to the ground, and fastening in the usual manner the bend some four or six inches under the ground; or a sizable plant may be bent over, nearly flat on the ground, by loosening the earth on the opposite side with a spade. In this way almost every branch will serve for a layer. They may be cut from the parent stock the first or second spring after having been layed.

THE CHINESE MULBERRY.—The *Morus multicaulis*, Chinese mulberry, was, we believe, first introduced into this country by the late Andrew Parmentier, of Brooklyn, in the year 1828. It has since been greatly propagated, and is rapidly extending over the country. As far as experiments have been made, it promises not only to be a rival of the white mulberry, but to supersede it.

Its advantages are its very large leaves, affording a much greater amount of food for the worms; its being a tree of much less height rendering the gathering of the leaves not so laborious, and the ease with which it can be rapidly propagated by layers and cuttings. It is thought to produce silk equally as good, if not superior to that from the white mulberry. For hedges, it is supposed to be admirably adapted, from its disposition to send up numerous suckers, and from the richness and beauty of its foliage. The rapidity with which it throws out new leaves during the growing season, renders it a valuable plant for the rearing of two crops of cocoons.

PROPAGATION.—It is generally increased by layers. A plant of one or more years' growth is bent over, in the spring, or early summer, by loosening the earth; the limbs are extended and firmly secured in the ground by pegs or crotchets. The whole plant and the branches are covered over with the soil to the depth of about an inch. If the soil is rich, a young shoot will rise from almost every joint, and obtain a growth of three to six or eight feet the first season. In the succeeding fall or spring they may be divided into separate plants, and transplanted.

If the soil is very rich, the young plants making a vigorous growth, the wood does not always ripen sufficiently to stand the winter of the Northern parts of the Eastern States.

DIBBLE.—It is very probable that increased attention will be given in this country to planting and sowing in rows. We give the accompanying engraving from the British Cyclopædia.

This is an agricultural implement employed in making holes in the ground for setting grains, plants, and other sorts of crops in which are planted in rows. Their form, and the materials of which they are made, differs according to the nature of the crop which is to be put in or planted out by them; but for grain they are mostly shod with iron. In some cases they have likewise a sort of step for setting the foot upon, in using them. When employed, they are thrust into the ground to a depth suitable to the crop which is to be put in by them, and holes thus formed, into which the seeds, sets, or plants, are put by the hand.

We give the above engraving of a dibble act-

ing by the foot as already described; a represents the depository for the seed, &c.; the discharge valve is shown at b, the opening and shutting of the hopper being by a double lever, g, resting against the heel above, e; the dibble-iron and guide is shown at c f."

REPORT OF LIVE HEDGES.—The "Massachusetts Society for the Promotion of Agriculture," in the view it was their duty to take of those objects to which public attention might be beneficially invited, have thought that, in the progress of the culture and improvement of the country, Live Hedges would, in many places, become highly important and even necessary, where stone is not to be had, and timber, as must soon be the case, shall become more valuable for other uses. The beauty, permanency, and efficacy of this mode of enclosure is, with foreigners and many of our own countrymen, becoming a subject of taste and admiration. It is not our intention to deny the efficacy or expediency, in most places, at present, of a good rail fence, or, what is better, a strong stone wall. But, as our divisions of land multiply, these materials, in many places, will become more scarce and difficult to be had. As this shall occur, the introduction of live hedges will come into use here, as they prevail elsewhere. A gradual introduction of them must be useful, and add a verdure and beauty to the face of the country as its cultivation increases. Under this impression, the trustees of the Massachusetts Society were induced to offer a premium of \$30 for the best hedge, not less than 100 rods, which shall be in the most thriving state in 1833.

On this subject the committee on live hedges have a pleasure in presenting to the public the following communication of E. Hersy Derby, Esq. It will be seen that he has, by well-tryed experiment, established the perfect adaptation of the Buckthorn (or *Rhamnus Catharticus*) to our climate, as well as its preference over several other plants.

They therefore unanimously award to E. Hersy Derby, Esq. the premium proposed or \$30, for his hedge, of upwards of 100 rods, and recommend that his detailed and useful communication on this subject be printed.

By order of the Committee,

JOHN WELLES, Chairman.

Salem, Nov. 30, 1833.

The Committee on Trees and Live Hedges.

Gentlemen,—Please consider me an applicant for the premium offered by the Society for the best buckthorn hedge, not less than 100 rods, which shall be in the most thriving state in 1833. On measuring mine, I find I have over 118 rods of the buckthorn hedge, which I have reason to think would be considered at least equal to any in this country.

The trustees generally have examined the state of it the present season. Should it be thought proper, I will make a few observations on my experiments in hedging.

I have been for a great many years fully convinced of the superiority of live hedges for efficacy and economy. I began by setting out my first hedge about thirty years since, of the English hawthorn; the result was far from satisfactory; the plant, being not adapted to our climate, is injured by our summer droughts; frequently experiences blight early in August, and, by the first of September, assumes a wintry appearance. My next experiment was with the three-thorned acacia: to this hedge I devoted the most careful attention; but the result was equally unsuccessful. The plants run up without interlacing, and the thorns growing only upon the upper branches, the stems below were not thick enough to serve as a fence; it was beside too tender a plant to bear our severe winters. I also tried the crab-apple with but little better success. About 1808, there was standing in the garden of the venerable Dr. Holyoke, of this town, which adjoined that of my brother, a large tree of the buckthorn or *rhamnus catharticus*. In digging the latter, the gardener found several young plants, which

had grown from seed shed by this tree. They were given to me and set out in a nursery; finding they grew very rapidly, I was induced to set them out for a hedge some time in 1809, and in this attempt I was entirely successful. The length of this hedge is about 20 rods; has been a good fence over 20 years, and is, at the present time, in a fine, healthy state, not a single plant having failed since it was first set out. It presents a mass of verdure from early spring until late in the autumn, and is completely impervious, affording entire protection to the land it incloses. It being my first experiment with the plant, I did not head it down so low when young as I have since found it advisable to do; the consequence is, that it is not so thick at bottom as any of my others set out since. Finding it so hardy a plant, and so well adapted for hedges in our climate, I have been induced to cultivate it very extensively, and have, at different periods, extended my hedges until they measure nearly 120 rods in length.

The method I should recommend in setting a hedge, would be to place the plants in a single row, about 9 inches apart, either in the spring or fall of the year; if in the fall, I should clip it the next spring, within six inches of the ground, which will cause it to be quite thick from the bottom; any after-pruning can be made to suit the pleasure of the cultivator. I have also tried plashing; it was recommended to me in 1818 or '19, by my gardener (an Englishman), and I allowed him to try it upon a young hedge of crab-apple; but the hedge never flourished afterwards, and I, at last, pruned away the branches he had interwoven, and lost four years' growth by the experiment. I have never found plashing necessary for the strength or beauty of the buckthorn hedge, the natural growth of the branches being sufficiently interlaced. Three years' careful management in the way I have described is sufficient to form a perfect hedge, nearly as thick below as above. I am, gentlemen, very respectfully, yours, &c.

E. HERBY DERBY.

DOUBLE POTS FOR MARSH AND TENDER PLANTS.—You will perceive that this double pot is formed by simply placing one pot within another, the latter being a size larger than the former, and uniting them at bottom with a little Roman cement. The holes in the bottoms of both plants must be opened with a stick before the cement stiffens; otherwise, of course, the water in the inner pot could not escape.

In the figure, *a* is the inner pot; *b*, the vacuity between the two pots; and *c*, the cement which unites them at bottom. By keeping the vacuity between the pots (*b*) filled with water, the smaller or inner pot (*a*) will absorb moisture sufficient for the nourishment of the plant, provided the material of the pot be not too hard burnt; the water between the pots can at any time be emptied out, and the outer pot will then act as a shade for the roots of the plant in hot dry weather.

In my humble opinion, if a cheap and simple method could be found for shading pots exposed to the sun, we should not have so many sickly scorched-looking plants in the summer season. I am not aware of any pots having been made on the above principle.—[Thos. Blair, Stamford Hill, June 22, 1853.]

This mode of equalizing the moisture and temperature of the exterior side of pots is, as far as our experience goes, quite new; and, certainly, it appears well adapted either for growing marsh plants, by filling the interstices

between the pots with water; or delicate plants, easily killed either by too much water or by neglect of water, such as cape heaths, by using moist moss instead of water. Many persons find it very difficult to keep heaths in warm rooms, even during the short time they are in bloom, without either over-watering them, or keeping them too dry; Mr. Blair's pot, either with water or moss, would be an effectual remedy.—[Gardener's Magazine.]

WATERING PLANTS IN THE OPEN GROUND.—A mode of supplying plants growing in the open soil with water, during dry intervals of summer, practised by the Rev. Geo. Reading Leathes, of Shropham, Norfolk, deserves to be made known; and may, although it has nought of parallelism or likeness to Mr. Blair's, farther than its relation to supplying water, be described here. Soil dried to dustiness resists water; and not every assistant whom one may request to water the plants, which may be languishing in the garden, will take the patient and honest pains to give them the thorough soaking they require. When the soil about a plant or plants is dried to dustiness, the moistening it by watering requires that water be applied in a small quantity at a time, and repeatedly. The doing this occupies much time; yet you must either do this, or open with a spade, at the foot of the plant, a hole that will receive at once a larger supply of water; and this latter mode has the effect of leaving the gully hole, as it may be termed, and the earth which had been taken out of it, exposed to view: an offensive sight to those who have a passion for evenness of surface in the soil of their gardens. Mr. Leathes practises neither of these modes; but, as an equivalent to both, sinks into the soil, at the foot of the plant requiring water, a flower-pot, immersed to the half or whole of its height or depth, with its size proportioned to the quantity of water which the constitution of the plant may indicate it to need, and with the drain hole of the pot left open at the bottom. When each of the plants most liable to injury from drought has received the apposition of a flower pot sunk at its base, the watering of all these plants is thenceforth effectible with an increase in the rate of despatch, quite or more than equivalent, in a drought of some duration, to the first expenditure of time and trouble: besides, too, the valuable satisfaction supplied to him who takes this trouble, of feeling conscious that every plant receives the whole, and directly to its roots, of the quantity you may please to pour into the sunk flower-pot; through the drain hole at the bottom of which the water passes at a rate determined by the degree of absorbency in the soil, without detaining him who supplies it until it has soaked away.—[Loudon.]

BLOOD MANURE FOR THE VINE.—The vine is manured with bullock's blood in autumn, and the shoots are laid down and covered with dry leaves; by which they are protected against severe frosts, and also in the beginning of spring against those fine days which occasion their early vegetation. They are pruned in spring after the leaves are removed.—[Baron Kottwitz, in Loudon.]

THE PROPAGATING OF CABBAGES BY SLIPS AND CUTTINGS.—The first shoots only are applicable to such a purpose; the second run to seed. [Maund's Botanic Garden, June, 1853.] This fact, one of some consequence, is stated by Mr. Maund, on the cover of his number of the Botanic Garden for September, to be supplementary to the information on this subject in pp. 126, 127, and to have been communicated to him by the author of that article, Peter Kendall, Esq.

SUGAR IN SOUPS.—A London paper says, "Sugar is now becoming a universal ingredient in many of our soups in ordinary use, such as soup crisis, gravy soup, &c., being found to add greatly to their flavor and wholesomeness."

NEW-YORK AMERICAN.

FEBRUARY 15—21, 1854.

LITERARY NOTICES.

No. XV.

Marshall, (Calhoun Co.) M. T., Dec.

I confess that it was with some pleasure that—after dividing my time for several days, as described in my last, between roads rendered almost impassable by continual snows and log cabins, where the recent settler, however hospitable, had but spare accommodation to offer to the passing traveller—it was with some pleasure that on rising an elevation on the northern bank of the Kalamazoo, I saw a large frame building, which was evidently a tavern, rearing its comfortable looking chimneys above a group of log huts on the plain beneath. My horse, who had doubtless repented of former escapades in the companionable intercourse which had now for some time subsisted between us, seemed to sympathize in the feeling; and pricking up his ears, as he snuffed the grain in a flour mill directly beneath us, we descended the slippery height, and were soon tolerably well housed in the new Inn of Marshall. The house was indeed not as yet plastered inside; and the different bed-rooms, though lathed, seemed divided from each other rather by lines imaginary than real. But the bar-room wore already the insignia of a long established tavern in an old community; and apprized me at once, by the placarded sheriffs' notices, and advertisements for stolen horses, grain to be sold, and laborers wanted, which indicate the growth of business in country life, that society was in a pretty mature state—at least six months old—in the county town of Marshall. I was therefore not at all surprised to find among these notices a call for "a Railroad Meeting" in the evening—especially as nearly 18 months had elapsed since the first white man erected his cabin in this section of the country.

The meeting, which might be termed a crowded one, was conducted with more animation than unanimity. There were several very intelligent men present, however, and I listened with interest to their exposition of the resources of this section of Michigan, which, as a wheat growing country, may be justly compared to the celebrated Genesee valley of New York, while the soil, as I have heard it well observed by a resident, "unlike the heavily timbered land of the Eastern States, instead of wearing out one generation in subduing it for the purposes of the husbandman, invites the plough at once." Nor, if a railroad should be constructed from Detroit to the mouth of the St. Joseph's, passing through the counties of Wayne, Washtenaw, Jackson, Calhoun, Kalamazoo, Van Buren, and Berrien, do I think it would be too bold to assert, that the amount to be transported by the time the work was completed would be equal to one million of barrels; which is a less estimate by two hundred thousand than I have seen given by an intelligent writer on this subject, in a Detroit paper. The route thus designated I am persuaded, is the right one for a Railroad; though, should a different mode of communication be determined upon, it would be difficult to decide whether it were most expedient to construct a Canal from the Falls of Grand River to Detroit, or from the navigable waters of the St. Josephs to Monroe. I do not hesitate to add that before two years have expired, all of these routes will be under contract. The abundant resources of Michigan are developing so rapidly, that they will shortly require all these outlets; and in a country where you may drive a barouche and four for hundreds of miles in any direction through the woods, the expense of constructing more artificial ways will be comparatively trivial. Did I not know how ignorant generally the people of the East are of the resources and condition of this country, it would surprise me that some New York capitalists have not embarked in some of these

works. A prodigious speculation might be realized by laying out a Railroad on one of these routes above described; having first purchased the land in its vicinity at Government prices, to be disposed of afterward when its value should be enhanced by the completion of different sections of the work. The ingenious writer above alluded to, has already suggested this mode of covering the expense of such an undertaking. You can have no idea of the feeling existing on the subject of internal communications throughout Michigan; and it would amuse you not a little to witness the heart-burnings and jealousies on the subject which pervade a country but just beginning to be populated. The rapidity with which people establish themselves, and collect the indications of agricultural wealth around them, before they have even the ordinary comforts of life, will, in a great measure, account for their looking thus ahead and quarrelling about the game before it is hunted down. The farmer who has more grain in the sheaf stacked in the field than he can accommodate in his barn, is naturally more eager to find the means of sending a share of it to market. I was quite diverted at the turn matters took at the meeting which suggested these remarks, when a discussion in relation to the various routes to be recommended to Government in case they should consent to make a railroad through the Peninsula, became unpleasantly warm. "This pother reminds me Mr. Chairman," said an old pioneer, "of two trappers, who, in planning a spearing expedition for the next day, quarrelled about the manner in which a turtle which they proposed taking, should be cooked for their supper after the days sport was over. An old Indian happily settled the difficulty by proposing that they should first catch the turtle! Now, sir, as this railroad"—"The case is not at all parallel," interrupted a still more ancient speaker, "for Nature has already caught the turtle for us. She meant the railroad to pass right along here and no where else."

The councils of the meeting were not on the whole, so harmonious as I could have wished from the courtesies offered me after its termination by the adherents of the two parties of Guelphs and Ghibbelins which distract the unborn city of Marshall. But it was surprising to a stranger upon looking round at the hovels of mud and logs, which as yet occupy its site, to find so many persons of intelligence and refinement thus collected in their precincts. The population of Michigan generally, as I believe I have before observed, is much superior in character to the ordinary settlers of a new country. The ease with which a man can here support a family as a farmer, induces a great many persons of all professions in other States to abandon their former pursuits and become tillers of the soil. The alteration of life I should judge by the contentment I everywhere witness, is almost always for the better.

I have met with several dispeptics who have been completely cured of that horrible disease by their change of life. With such, health is a sensation—a positive delight; and in duly estimating the blessing, they of course were ever ready to praise the conditions upon which they enjoy it. Others again bred up in a city, find in the indulgence of that love of rural life, which, when it is a natural taste is inextinguishable, an ample compensation for breaking up established habits and associations. The majority again are men of slender means; and while the necessity of attending practically to the subsistence of their families keeps them employed, the want of pecuniary resources prevents their embarking in the thousand idle schemes which tend so often to the chagrin and the ruin of "gentlemen-farmers." But the main cause of Michigan being settled by such respectable people, remains yet to be mentioned. It is that no one can take up an acre of land without first paying cash for it at one of the three land offices of the territory.

The whole surface of the Peninsula has either been, or is now being, surveyed into townships of six miles square. These again are subdivided into sections of a mile square; which sections are again cut up into lots of forty acres; which is the smallest quantity of land that can be taken up from the Government. The price is invariably \$1 25 an acre. When you consider, therefore, that every emigrant who means to locate, (this is a sound American word, and as indispensable in the vocabulary of a western man as are an axe and a rifle among his household furniture) must, however poor, have some earnings in advance to purchase the spot upon which he is to live; and to bring his family to such a remote distance it will be easy to conceive that the industrious and the enterprising must constitute the largest portion of such a population of freeholders. The prosperity of a whole community, composed of such aggregate masses, may be safely predicted; and though one sometimes meets with those whom the first process of accumulating renders discontented and induces to speak ill of the country, yet in general I may say, that the pride of a Michigian in the beautiful land of his adoption, is as strong as the home-feeling upon which the citizens of some of the older States pique themselves. As for the sickness which always prevails more or less among the new settlers, to one who is aware of their imprudences, the wonder is that the majority of them escape with their lives. Think but of people setting themselves down on a soil of twenty inches in depth, and in the month of June when the weeds and wild flowers oer-top the head of the tallest man turning over the rank soil immediately around their dwellings, and allowing the accumulation of vegetable decomposition to be acted upon by a vertical sun, and steam up for months under their very nostrils; and yet this, I am told, is continually practised by settlers who come in late in the season, and are anxious still to have a crop the first year. Here, as in the case of those settlers, who, for the sake of the wild hay, locate themselves near the great marshes, imprudence alone is manifested; but the charge of culpability will justly attach to some other cases, when nuisances, not before existing, are created by the owners of property. I allude to the practice, expressly prohibited by the laws of Michigan, of flooding land while constructing mill ponds without removing the green timber growing upon the spot. So pernicious is this to the health of the neighborhood, that it affects very sensibly the value of property near the new pond, and yet in their eagerness to have mills erected, and aid the market of their overflowing granaries, the new inhabitants overlook entirely the gross violation of their laws and the melancholy consequences which ensue to their families. Another cause of sickness is drinking the water of springs or rivers which head in marshes, and are of course impregnated with their baleful properties, instead of digging wells where water is not liable to such exception. As for general healthfulness of situation, I believe it is agreed that the banks of the small lakes which so abound in the Peninsula, are—when these transparent bodies of water are surrounded by a sand beach, which is the case with about a third of them—by far the healthiest. They are fed generally by deep springs, and almost invariably are supposed to have a subterranean outlet, while so beautifully transparent are their waters, that the canoe suspended on their bosom seems to float in mid air. These lakes abound with fish, and in some of them of only a few acres in extent, fish have been taken of forty pounds weight. They generally lie embosomed in the oak openings, and with their regular and almost formal banks, thus crowned with these open groves, these silver pools might be readily taken for artificial trout ponds in a cultivated park. I need hardly add, that it is necessary to diverge, as I have, from the route generally travelled, to see these scenic

gems, so numerous, lonely, and beautiful. Not one in a hundred has a settler on its banks, and I confess I take a singular pleasure in surveying these beauties, as yet unmarred by the improving axe of the woodman, and unprofaned by the cockney eyes of city tourists; nor would I change my emotions, while ranging alone over the broad meadows, traversing the lofty forests, or loitering by the limpid lakes of Michigan, for the proudest musings of the scholar that revels in classic land. It may argue a want of refinement in taste, but I confess that a hoary oak is to me more an object of veneration than a mouldering column, and that I would rather visit scenes where a human foot has never trod than dwell upon those gilded by the most arrogant associations of our race.

What are the temples which Roman robbers have reared? what are the towers in which feudal oppression has fortified itself? what the blood stained associations of the one, or the despotic superstitions of the other, to the deep forests which the eye of God has alone pervaded, and where Nature, in her unviolated sanctuary, has for ages laid her fruits and flowers on his altar? What is the echo of roofs that a few centuries since, rung with barbaric revels, or of aisles that pealed the anthems of painted pomp, to the silence which has reigned on in these dim groves, since the first fiat of Creation was spoken?

I shall diverge from my western course tomorrow, a few miles southward, in order to visit a groupe of lakes, near which a band of Pottawattamies, a tribe I have not yet seen, have their encampment. I will leave this letter open, in order to give you the result of my visit.

Pittsborpe, (Calhoun Co.) M.T. Dec. 23.

I write to you from a little cottage in a beautiful grove, not far from the banks of the Kalamazoo, where two young gentlemen, recently from the east, have erected their tabernacle in this land of enterprise. It is amusing to observe how little singularity people here attach to a mode of life, which, in older countries would be looked upon as highly eccentric. My entertainers are both young lawyers, liberally educated, and men of much accomplishment, and yet the house in which I am passing the night, with every article of furniture it contains, is of their own manufacture; saw, an axe, a wood knife, and a jack-plane being their only tools. It would amuse you not a little, to look through the window, and see our little groupe at this moment. One of my companions whose axe and rifle are suspended by wooden hooks to the rafters over his head, is professionally engaged in drawing a declaration at the table upon which I am writing; while the other having just got through removing the remains of our game dinner, prepared and cooked by his chums, is now sitting with a long pipe in his mouth, watching a coffee pot which steams up so fragrantly from the live embers, that no light consideration would induce me to part with the interest I have in its contents. Their house, which has been thus occupied for three months, is a perfect pattern of neatness, though as it consists of but a single room, no little ingenuity is required to arrange their books, house-keeping apparatus, and sporting equipments, so as to preserve even an appearance of order in such a banbox. They have already sufficient business, they tell me, to sustain their moderate household; and as the Indians supply them with abundance of provisions, they have ample leisure to devote to study. It is far from uncommon, however, to meet thus with persons of finished education, and accomplished manners under as humble a roof as this in the wilds of Michigan. For so rapid is the growth of society here, that he who aims at a prominent station in the new community, must be a pioneer far in advance of the growing settlements. Two years ago the first white man raised his log hut in the county of Calhoun, it has now a population of 1500, and I have passed an eve-

ning in more than one mud-plastered wigwam, whose fair and elegant inmates would grace any society, however refined. I cannot help sometimes, when I see these fair young creatures, the wives and daughters of men habituated by early education to all the comforts and elegancies of refined life, thus submitting cheerfully to every privation for the sake of these whose happiness is involved with theirs, I cannot help involuntarily calling to mind the jargon of novels so often adopted by people of sense in cities, where the terms "excellent match," and "supporting in the station where she has been accustomed to move," usurp all considerations of mutual affection, and capability in the parties united to study each others happiness through life. I am more than ever persuaded that there are two kinds of refinement in life which bear but little similarity to each other, and the one least often met with is that which is independent of modes and fashions of tailors, milliners, and cabinet makers—which does not necessarily lean upon a pier table nor repose upon a *chaise longue*, which—shall I confess it? may be nursed without a silver fork. The purest porcelain which the factories of China produce does not require a single tint upon its surface to show the fineness of the texture, but that in which coarser clay is blended is always charged with some gaudy hue to hide the intermixture of the mongrel material. This doctrine though, is so little in accordance with those taught in the English novels, which constitute the modern text book of elegance, that while the mode of eating an egg is the test of good breeding, and the art of patterning French phrases the criterion of intellectual cultivation, I should as soon think of interfering with the particular province of a lackey or *friseur*, as breaking a spear at such disadvantage with Almacks and Captain Hamilton.

But a truce to this prosing. Did you ever see a *juniper*? A couple of hickory poles so bent that the runners and shafts are of the same piece, with a crate placed on four uprights, complete this primitive species of sledge, and when the crate is filled with hay and the driver well wrapped up in a buffalo robe, "the turn out" is about as comfortable a one as a moderate man could wish. In such a vehicle as this, with a harness every way suitable, viz: a collar of undressed deerskin and reins of rope, (the twisted bark of trees is often used) did I, with one of my present entertainers, the first companion I have yet had in travelling, sally out from Marshall this morning. My horse, who had detained me here a couple of days by a soreness of his back proceeding from the saddle, seemed highly to approve of this new mode of travel: Mr. Osbaldistone behind Tom Thumb, Sesostri in his chariot, or *Yorke* in one of Brower's new Omnibuses, could not have dashed off with more glee than did we with our merry jumper along the dimpling waters of the Kalamazoo; when lo, just as we had crossed a bridge of unhewn timber and were under full way through the oak openings, our frail barque struck on a rock hidden by the snow, and we were capsized and wrecked in an instant. Fortunately, though both were pitched like a couple of quoits from the machine, we were neither of us hurt; and my companion returning to the settlement to borrow a horse, I mounted mine, and leaving the remains of my crank establishment, where chance had thrown them, I rode on, while he overtook me in time to introduce me to his friend, and make me so pleasantly at home in their dwelling, as you must observe, I now am. Good night, I will tell you to-morrow evening how we dispose of our time till then.

December 24th.

The air was mild this morning, and large flocks of snow-birds twittering among the bur oaks, with the jays screaming from the woods, and the covies of grouse rising continually before us in the openings, made our route to the camp of Warpkesick more like a ride in the

spring-time, than a winter excursion. I was accompanied by my companion of yesterday; and as we were both well mounted we galloped over the openings towards Lyon lake, at a rate which brought us in a few minutes to the white sand beach which fringes that beautiful water. The marks of an Indian trail were here easily discernible; and following the foot marks dashed in the yielding sand, the frequent print of mockasons soon led us again away from the shore into a tall wood beyond. A morass that shook for yards around as our horses' hoofs would encounter the sagging peat, was next to be crossed; and then passing between two small lonely looking lakes, where a tall pine or two lifted its sweeping cone above the tapering tamaracks around, we struck at last into a dense forest. Here the numerous deer-runways, with the flocks of wild turkeys, and innumerable tracks of raccoons, wolves and bears, showed us that we were upon a favorite hunting ground of the Pottawattamies. As for the wolves they are little disturbed by the Indians, who consider them fair hunters like themselves, and privileged to go unmolested; they generally abound around a hunting camp; and soon grow fat on the offals of game slaughtered near it. But bears, though the successful hunter invariably takes his dead quarry by the paw, calls him his grandfather and asks his pardon for killing him, "being compelled to it by necessity," are hunted with great avidity; and you generally find a tamarac swamp, the favorite covert of these animals, in the vicinity of a hunting camp. We had ridden for about a mile through the heavily timbered land, when reaching the banks of the Nottawaseepee, a branch of the St. Josephs, I heard the sound of children's voices, and descried two or three red urchins wading through the shallow stream on stilts, while others of a similar age were amusing themselves in shooting bows and arrows on the opposite side. We immediately forded the stream, and making our way into a swamp, where the horses would sink to their knee at every step, came unexpectedly upon a piece of firm ground, some eighty yards in diameter, and found ourselves in the middle of the camp of Warpkesick. It was composed of three or four wigwams, only but they were large and probably contained several families each. They were constructed of mats, arranged in the form of a tent, and supported by uprights at either end, an opening being left in the centre for the escape of the smoke, and a blanket suspended over a hole cut in the side, supplying the place of a door. The day being mild for the season of the year the indwellers of these simple habitations were, at the moment of our arrival, variously occupied in several groupes on the outside. Some of the men appeared to be cleaning their weapons, and others were apparently engaged in arranging a bundle of muskrat traps—while one old fellow, whose screwed up features, peering from under a mass of grizzly locks, indicated the cunning of the trapper rather than the boldness of the hunter—was occupied in flaying an otter but just taken. The women were, however, the only ones who appeared to be assiduously engaged—the men having all a lounging air of indolence about them, incompatible with the idea of actual employment—dressing skins was the occupation of the former; and they each sat grouped like a hare in its form around a collection of boiling kettles, over which the skins were suspended. A tall virago of fifty, whose erect stature, elf locks, and scarlet blanket floating about her person, would entitle her to flourish as Meg Merrilies in the frontispiece of Guy Mannering, stood up in the midst and, had it not been for some tolerably pretty faces among her junior collaborators, might have been taken for Hecate herself, surrounded by the wierd sisters of the cauldron. A pack of wolfish looking curs, about twenty in number, completed the assemblage; which, when you take into consideration the variously colored

calico hunting shirts, and cloth leggings, in which the females had arrayed themselves, with the white, blue, red and green blankets in which the men were wrapped, constituted about as motley a collection as ever followed Falstaff to the field. Warpkesick himself, the chief of the gypsy band, issued from his lodge while I was thus studying the appearance of his adherents. He was a young man, not more than thirty, with a handsome though somewhat voluptuous cast of countenance and remarkably fine eyes. His stature was rather below the middle size; and though the upper part of his person was extremely well formed, with a deep chest and broad flat shoulders, one of his legs, whether from deformity or misfortune I did not like to inquire, was so twisted under his body as to be worse than useless. He supported himself upon an aspen staff, about eight feet in length, and terminating at the bottom in a round ball, to prevent it, probably, from sinking too deeply into the earth while in rapid pursuit of game; the chief being, in spite of the unsightly incumbrance he is compelled to drag after him, when bounding like a stricken panther, on his prey, one of the keenest hunters of his tribe. He received us courteously, but remained standing; while several Indians gathered in a few moments around him: after shaking hands with them all in succession, I took up a loaded gun, and by way of breaking up the formality of the meeting, desired an eagle-eyed young Indian to make a shot with it. He hesitated for a moment to comply, and immediately all the others from some whim or other insisted that I should shoot; our conversation being altogether in signs it was some moments before I understood their gestures; and I confess, that, having but little practice with a single ball, I was any thing but disembarassed when I came to understand the purport of the request they were proffering with so much animation. A small blaze that was instantly made with a tomahawk in a sapling, forty or fifty yards distance, left me no excuse for pretending longer to misunderstand my worthy acquaintances, and placing the gun to my shoulder I was as much surprised at putting the ball within a couple of inches of the centre, as if the tree had screamed when thus peirced by my random bullet. Having met with those in Michigan who will drive a rusty nail with a rifle at this distance and shoot leaves from each other heads at six rods, I could not account for the degree of approval manifested by the spectators till my companion informed me that the Indians, owing perhaps to the inferiority of their rifles, which are of English manufacture, are but indifferent marksmen at still objects. "*Tai-ya*," cried the women, "*Neeshin*," said the chief, and "*Neesheshin*," echoed his attendants; while the blankets of the lodges were now for the first time raised, and entering we stretched ourselves on mats around the fire. A youth of nineteen sprang to his feet as I removed the dingy curtain which formed the door, and revealed a face and form that might be the model of an Apollo. Being sick at the time he was but half dressed, the purple blanket dropping from his shoulders setting off a neck and chest of the finest manly proportions. His features were copied by nature from a Greek model; while his shaven crown, with the single chivalric scalp lock would in its noble developments have thrown the disciples of Gall and Spurzheim into ecstasy. The particularity of his head-dress, with the beautifully beaded leggings discoverable around his ankles, revealed to me at once, that the young gentleman was an Indian dandy—a Pottawattomie Pelham in an undress; and I assure you that Mrs. C— never schooled any of his New York rivals to wear their Spanish cloaks with a better air than was exhibited by my red friend Neeshwa-coquatchegon, or Three-garters, as he gathered the folds of his blankets about his person. Pipes were now lit, and Three-garters, who was too unwell to smoke himself, politely, after a few whiffs, tendering me his, while my companion, who could partially speak the language, was supplied from another quarter, we were soon perfectly at home; when, as I was trying to squeeze a tune from a species of flute, of imperfect tones, but having a rich mellow sound, after unsuccessfully attempting to purchase (the owner being absent) what I considered quite a remarkable Indian curiosity,

Warpesick rose suddenly, and stating that he had to start at once on a trapping expedition, signified that we should take our departure. An Indian pony stood at the door, and leaping at one bound into the wooden saddle, an immense bundle of steel-traps was handed to the Chief by a bystander, and, accompanied by an Indian on foot, almost as sorry-looking as the miserable beast he rode, our abrupt host disappeared at once in the woods. I was still trying to make terms about the flute, and had conciliated the squaws wonderfully by tearing out the silk lining of my frock coat, and giving it in shreds to their children, when my friend, being already mounted, told me we had better move off. I had barely time to cross the saddle, when a whoop rang through the woods, which, while it made my horse spring almost from beneath me would have wakened Rip Vanwinkle from his twenty years' doze. The piercing cry from the forest was echoed with an exulting shout from every wigwam. A dozen dusky figures leaped through their flimsy porches, and as many rifles gleamed in their hands. He of the heron feather was the first that caught my eye, and as his gun pointed in the direction whence the first whoop came, immediately behind me, I could not help, in spite of the undesirable propinquity of its muzzle, admiring the eagle eye and superb attitude of the young warrior. Not a soul advanced three paces from the covert whence he sprang. There was a dead silence. The children held their breath, and "Meg Merritties," who had stepped on a fallen tree at the first outcry, now stood so still that eldritch fumes, were it not for her elf locks, streaming over her scarlet blanket in the breeze, might have been mistaken for a creature of stone. Another whoop, and the cause of all the commotion at once appeared. A noble buck, roused from his lair by Warpesick, comes bounding by the camp, and buries his proud antlers in the dust in a moment. A dozen scalping knives pierce his leathern coat, and the poor creature is stripped of his skin almost before he has time to pant out his expiring breath.

I rode home reflecting upon all I had ever read of the want of vivacity and fire in the Indian character, and concluded that I would rather have witnessed the spirited scene I have just attempted to describe to you, than double all the knowledge I have hitherto laid up from such sources.

I leave this comfortable house in the morning, and it will be long before I reach again one half so agreeable.

H.

THE WRITINGS OF ROBERT C. SANDS, IN PROSE AND VERSE, with a Memoir of the author. 2 vols. 8vo. New York: HARPER & BROTHERS.—Those even who knew, or thought they knew, the extent of the acquirements and reach of the genius of Sands, will, we are persuaded, rise from the perusal of these volumes with increased admiration of his knowledge, taste and talents. The preliminary Memoir, understood to be from the pen of G. C. Verplanck, is written with a warm and affectionate interest in the fame of one who, though much his junior in years, had long been a literary associate and personal friend; and it presents an enumeration of his labors and acquirements and forms an estimate of his intellectual and moral qualities, such as to excite both wonder and respect.

Of the contents of these two handsomely printed volumes, much has appeared before. The leading prose article, however, in volume I. is now for the first time presented in an English shape—an historical Memoir of Hernan Cortez. This was prepared by its author in order to be prefixed to a Spanish edition of Cortez's letters, printed for South America, and was translated, as it was written, into Spanish. This memoir was written with care, and after consulting all the authors who could throw light on his subject, and it will be admitted to be an admirable sketch of the Conqueror.

We extract from the notice by Mr. Verplanck, a summary of the acquirements and character of Mr. Sands.

In ancient and modern literature, and languages, he had few equals, probably in our country no superior. He read familiarly the Greek, Latin, French, Spanish, Italian, and Portuguese authors. All the treasures of English literature, in the broadest sense of the word, were stored in his memory, from Chaucer to Charles Lamb, from Cudworth to Keefe. He had a general and more than ele-

mentary acquaintance with the mathematical and physical sciences, but for these branches of knowledge he felt little curiosity or interest. He held and maintained with Johnson, that the knowledge of external nature is not the great or the frequent business of the human mind,—that we have perpetual occasion for those principles of moral truth, and materials of reasoning or illustration, which are supplied by poets, orators, and historians, but are chymists or geometricians only accidentally or occasionally. He had laid a deep foundation of law learning in his youth, and though he abandoned the profession, he never quite gave up his legal reading. He was, therefore, probably as sound a lawyer as can be made without the actual and continued practice of the profession. His reverence for the law, and love of its peculiar learning and reasoning, led him to an extreme of prejudice against all reform or melioration of the system. He admired and defended even those narrow and inconvenient entrenchments which the ingenious and apologetic Blackstone himself allows are to be found among the spacious apartments of the ancient castle of English common law. He had, also, something of the same sort of dislike against the metaphysics of political economy, a study he never relished and never did justice to. He frequently maintained that it was not entitled to the honor of being called a science, and that "all the trash about values, and wealth, and reproductive industry was not of the slightest practical use." There was scarce any other part of knowledge which had not at some time excited his curiosity, and more or less engaged his attention. Hence his mind was stored with an immense mass of miscellaneous information; such as, if it is not learning, is often found much more useful. He had read extensively, though irregularly, in divinity and ecclesiastical history; and had settled his opinions on most of the contested points of theological discussion. His opinions seemed in general to be those of Taylor, Barrow, and the old divines of that school in the Church of England, which, however, he held with great moderation.

He revered religion, and all good and moral influences, wherever he found them to exist.

His large stores of learning and of practical information on men and things, could not have been accumulated without great activity and versatility of mind, and these he evinced in all his pursuits; for he possessed the power of vigorously directing the faculties of his mind to any chosen object of study, inquiry, or speculation. His fancy was surprisingly fruitful of original and striking combinations of ideas; and if his peculiar vein of humour had any fault, it was that of excessive and unrestrained exuberance. But he had none of that bitterness of spirit, or keenness of sarcasm which frequently give edge to satire. His indulgence in the laughable sprang from the love of the laugh itself. He had no touch whatever of the sneering misanthropy, or the contemptuous hatred for folly which have so often lent their savage inspiration to comic and satiric talent. His humour, as it overflowed in his conversation and letters, even more than in his written compositions, ran somewhat in the whimsically broad vein of Rabelais, (though quite free from his grossness) delighting like him to mix the topics and language of learning with the humours and phrases of humble or even of vulgar life.

It strikes me as a remarkable circumstance (whether common to him with any other learned wit, I cannot say) that with this buoyancy of imagination, this constitutional tendency to the jocose or the whimsical, all his favorite studies and literary recreations were of a very grave cast. He had early read most of the witty and comic authors of note, but rarely recurred to them in after life. When fatigued with business or literary labor, he did not as one might have expected, refresh himself with Swift or Smollet; admire the chivalrous fancies and noble horsemanship of La Mancha's knight, or "laugh and shake in Rabelais' easy chair"; but he returned with ever fresh delight to hold communion with ancient ages and scholars, or else

—entranced to hear
O'er battle fields the epic thunder roll;
Or flax where tragic wail upon the ear
Through Argive palaces shrill wailing stole.*

So too, all his deliberately selected subjects of composition were of a serious nature, generally demanding grave reading and research. His pleasure was all spontaneous, unpremeditated, unbidden.—Nor were his laughable associations ever applied to subjects worthy of higher thoughts, for quick as he was in his perception of the ridiculous, he was equal-

* Yarnoyden.

ly sensitive to all that is beautiful in nature, or grand and elevating in sentiment.

Who can read this sketch—beautiful as we believe it true—and not lament anew that its brilliant subject was prematurely cut off at the age of 33?

TREVELYAN—by the author of *Marriage in High Life*. 2 vols.: Philad.—CAREY, LEA & BLANCHARD.

An interesting story—from a female pen, so at least we assume—and wrought up with a thorough knowledge of the human heart and its passions, modified but not subdud by the arbitrary rules of society.

The characters both of Trevelyan and his sister are portrayed with great skill, and have withal much of originality in them.

TRAITS AND TRADITIONS OF PORTUGAL—collected during a residence in that country, by Miss PARDON. 2 vols.: Philad.—CAREY, LEA & BLANCHARD.—These are light and pleasing recollections by one who seems to have enjoyed the beautiful climate of Portugal, without suffering herself to be incommoded by the numberless inconveniences, especially to a female traveller, in that country of primitive usages. There is no continuous story; but, as the title implies, tales and traditions suggested by the place or company in which she happened to be. The stories, however, would have been quite as effective by the omission of the numberless Portuguese phrases, which—as the translation is given in notes—only serve to encumber the pages.

THE COOK'S OWN BOOK, AND HOUSEKEEPER'S REGISTER, &c. &c. By a *Boston Housekeeper*. 1 vol. 8vo. Boston: MUNRO & FRANCIS. New York: C. S. FRANCIS.—Some books are for instruction chiefly; others for amusement; some teach a particular branch of learning; others, more general, treat of the whole circle of sciences: but the book of books, profanely speaking, is that which exhibits man to most advantage in his distinctive character as "a cooking animal." Such a book is now before us—well printed, and with a due regard to the march of mind, now in full progress, having interleaved blank pages, whereon taste, curious of novelty, and fond of change, may record—for the benefit of after times, and future editions—the current remarks and *obiter dicta*, or opinions dropped by the wayside, of fastidious experimentalists. We therefore commend this book, as invaluable for reference, and especially to be consulted by all who desire to combine economy and health, with a reasonable share, of good living.

THE MUSEUM OF FOREIGN LITERATURE, FOR 1834.—2 vols. 8vo. Philadelphia, J. LITTLE.—We are indebted to the publishers of this well conducted monthly miscellany, for the whole series of last year, bound up in two handsome volumes—and furnishing of themselves a great mass of agreeable reading—which may always be taken up—laid aside—and resumed at pleasure; and thus fill up many a gap of time that might at least otherwise be wasted. One hardly realises, till the volumes are before his eyes, the amount and variety of matter, which in the course of a year is accumulated in this periodical—which certainly seems more valuable when thus collected, than even in its fresher but more fugitive state of monthly numbers.

THE BOOK-KEEPER'S ATLAS; or, perfect system of Book-keeping by double entry, &c. &c. by Wm. EDWARDS.—New York, HARPER & BROTHER.—This is a handsome and clearly printed quarto volume, showing by a series of actual transactions the most approved mode of stating, and keeping, and checking mercantile accounts. It appears to us well done; but what is much more decisive, it is so certified to be, by many active and intelligent merchants of our city.

AN ELEMENTARY PRACTICAL BOOK FOR LEARNING FRENCH, adapted to the capacity of children; translated from the German of Dr. J. H. P. Leidenstueck.

er, by Mrs. BARBARA O'SULLIVAN ADDICKS: N. York, J. B. COLLINS.—If we were in doubt as to the value of this school book and its adaptedness to the capacity of children, we should yield at once to the authority of the competent judges who have furnished the translator with the decisive testimonials she publishes of its merits. The method adopted in it, is that now generally pursued by, we believe, the most successful teachers in all languages—that of following, as nearly as possible, the natural way by which children come to the knowledge of their mother tongue: first by learning isolated words, then by combining them. This little volume is well and accurately printed.

MEDICAL AND SURGICAL CASES, &c.—by DUDLEY ATKINS, M. D. N. Y.—PETER HILL.—A well-printed volume—of cases rare and difficult—which will, we dare say, have abundant attraction for the profession.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES, for Feb. Philad.—CAREY, LEA & BLANCHARD. This, like the former, is a work mainly for the profession. It is a quarterly publication, well-printed, and apparently with abundant contributions. We are struck with one remark in a paper by Dr. Gibson, of Philadelphia, detailing the operation of removing a large tumor from the neck of a lad of 18—namely, that on a comparison of the results of tying up veins—always a hazardous experiment—death has most usually resulted in Europe from such an operation, while in this country, Dr. G. avers, that he never met with any case of death or injury from the operation. For this remarkable fact Dr. G. thus accounts: "I think it very probable that the constitutions of patients in this country—owing to all classes of people being well fed and clothed, and little exposed to hardships—are generally superior to those of Europeans, and as such more capable of resisting the operation of injury or disease."

DAILY MORTALITY OF THE HUMAN RACE.—The annexed extract from a work recently published in England, by a *Layman*, on the *State of the Departed Soul* taken in connexion with the sensation produced by the recent sudden death of Mr. Bouldin, of Virginia, on the floor of the House of Representatives, exemplifies anew the truth of the remark, that individual instances affect the imagination much more deeply than general truths. The death of this one Legislator, under the circumstances in which it occurred, startles the mind more than the immense fact, that more than ninety-one thousand beings, like him, perish daily.

From a late Work "On the State of the Departed Soul."

"The life of man, on an average, is little more than 30 years, and as there are one thousand millions of human beings on the face of the earth, (according to the latest estimate,) it will be found that 91,324 of our own race die every day. Every hour which goes over our heads, about 3,800 immortal souls go out of this world; and as the population of the earth is on the increase, a greater number come into it, to inhabit mortal bodies in their room—a consideration which should show how the necessity of preparation for yielding our places to others, and for joining the invisible flight of spirits which are continually leaving the earth; for no one can tell, but that the next moment, his soul may be called on to become one of the number.

The death of Mr. Wirt—after a short illness—at Washington, seems to have been deeply felt. The bar of the Supreme Court immediately assembled—Mr. Attorney General Butler presiding, when Mr. Webster offered a series of resolutions expressive of the admiration and respect of the meeting for the deceased, which he prefaced with a beautiful notice of the talents and character of his lamented friend.

[From the Globe.]

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate. William Noland to be Commissioner of Public Buildings in the City of Washington, in the place of Joseph Elgar, removed.

George Huyler to be Consul for the the port of Nassau, in the Island of New Providence, in the place of John Stoor, resigned.

Nicholas P. Trist to be Consul for the port of Havana, in the Island of Cuba, in the place of William Shaler, deceased.

Maximo de Acquire to be Consul for the port of Bilbao, in Spain in the place of F. Xavier de Ealo, resigned.

Joshua Dodge to be Consul for the port of Bremen, in the place of Nathaniel Pearce, removed.

Daniel Brent to be Consul for Paris, in France, in the place of Isaac C. Barnett, deceased.

Charles J. Hambro to be Consul for Copenhagen, in the Kingdom of Denmark, in the place of John Raynals, deceased.

Robert Grieve to be Consul for the port of Leith, in Scotland, in the place of Joel Hart.

John Morrow to be Consul for the port of Halifax, in the province of Nova Scotia.

Joseph Balestier to be Consul for the port of Rhio, in the Island of Biantin, in the Malayan sea.

Thomas H. Barker to be Consul for the port of Elsinour, in the Kingdom of Denmark.

W. M. Haxton to be Consul for the port of Bathurst, in the Island of St. Mary's in the river Gambia.

By the annual report of the New York Savings Bank, it appears that in the course of the year 1833, they received from 20,015 depositors, \$1,155,980.33. Five thousand and twenty seven of these new accounts. During the same period, \$923 072.25 have been drawn out by 11,893 depositors; 2534 of whom have closed their accounts. Among the depositors, there are 150 clerks, 101 cartmen, 146 carpenters, 869 domestics, 400 grocers, 589 laborers, 331 seamstresses, 152 shoemakers, 123 tailors, 688 minors.

The receipts of the bank since its establishment in July, 1819, have been \$8,902,137 24; and the sums repaid to depositors have amounted to \$6,748,202 65—having in the bank on the 1st of January, 1834, 2,153,934 59. Add to this the interest up to the same date, and including the January dividend, and there was due to depositors on the 1st of that month \$3,105,778 03. The simple statement of facts in this report, shows in the most conclusive manner, the great value of this institution.—[Daily Advertiser.]

[From the Journal of Commerce.]

BANK OF NEW BRUNSWICK.—News was received here yesterday afternoon, that the Bank of New Brunswick, N. J. had suspended payment. Its circulation in the city of New York is believed to be small.

In consequence of injurious reports and the pressure of the times, the President and Directors of the Bank of New Brunswick have been under the necessity of suspending payment; but at the same time they deem it their duty to caution the public against sacrificing the bills of said Bank,—as they believe the Bank to be solvent; and that eventually all the bills will be redeemed. F. RICHMOND, Cashier. February 18.

[From the Lowell Journal of Wednesday.]

LOWELL, Mass.—We learn with regret, almost approaching to horror, that many of the directors and stockholders of the Factories in this town, are upon the point of deciding to stop the mills. The effect upon thousands of our people will be indescribable. Laborers of every class, and artisans of every trade, must go, they know not whither, to seek in vain for subsistence; and all the inhabitants who depended upon them again for a support, will be left destitute of means to obtain their daily bread. Others of the stockholders, and especially the agents and superintendents, are desirous of preventing this annihilation of the laboring interests, by reducing the rates of wages so low, that they would feel justified in continuing to manufacture for the present, though no doubt can exist, for a moment, that it would be safer and better for them, on many accounts, to stop at once. Common humanity will pray, that the results of their deliberations may be favorable to the poor, and if such a rate of wages can be established as will prevent too great a sacrifice on the one hand, and enable the working classes to live for a time on the other, we may hope, that dark as the prospect is before the country, some means will be devised by the Government to restore prosperity, and give a new impulse to manufacturing enterprise.

From FRANCE, we have received papers which should have reached us Friday last, to 26th Dec'r.

They present the King's speech on meeting the

Chambers—as unmeaning as the most unmeaning of its forerunners—and which, though it alludes to all European nations, with whom questions of any sort are pending, makes no reference whatever to the United States; notwithstanding the fact, that a treaty, duly ratified on both sides, has been rendered inoperative by the fault of the French Government.

We take the extracts which follow from the Courier and Enquirer:

FRANCE.—PARIS, DEC. 24.

His Majesty's Speech on opening the Session of the Chambers.

"PEERS AND DEPUTIES—Gentlemen, France has continued in undisturbed tranquillity since our last session, and the enjoyment of the blessings of order and peace. Throughout the country, industry and labor meet with their reward. The population, occupied and peaceful, feels assured of the stability of our institutions, of my fidelity in watching over them, and that public security is the pledge of national prosperity.

"It was by guarantying our rights, protecting our interests, and by the equity and moderation of our policy, that we have obtained these happy results.

"In order to render them lasting, we shall persevere with energy and patience in the same system. An unceasing vigilance is still necessary; insensate passions and culpable manoeuvres are at work to undermine the foundations of social order.

"We will oppose to them your loyal concurrence, the firmness of the magistrates, the activity of the administration, the courage and patriotism of the National Guard and the Army, the wisdom of the nation, enlightened as to the danger of these illusions, which those who attack liberty, in pretending to defend it, still seek to propagate—and we will insure the triumph of constitutional order and our progress in civilization. It is thus, gentlemen, that we shall at length put an end to revolutions, and accomplish the wishes of France. I thank her for the support she has given me. I thank her for the tokens of confidence and affection with which she has surrounded me. I received them with emotion in such of the provinces as I have been able to visit; and I render thanks to Providence for the blessings which our country already enjoys, and for those of which the future holds out a promise.

"You also, gentlemen, will second me in my endeavors to protect the increase of our national wealth, in opening to our commerce and industry new sources of prosperity, and to spread ease with labor throughout all classes of the population.

"I hope that the new Law of Customs, while it evinces the progress of our industry, will conciliate the protection that is due to it, with those principles of wise liberty which enlightened governments are disposed to admit.

"Popular instruction has received, thanks to your concurrence, a salutary impulse.

"The Finance laws, and those required by the execution of treaties, will be speedily presented to you. The public revenue improves, and every thing foretells that it will continue to follow the ascending movement of our prosperity.

"Several projected laws, some of which have been already presented to you, will also be submitted to your deliberations. I have reason to hope that the promises of the Charter will be accomplished in the course of this Session.

"I am happy to announce to you that our relations with all the Powers and the assurance I receive from them as to their dispositions, leave no doubt as to the maintenance or the general peace.

"The Peninsula has become the theatre of important events.

"As soon as the Government of the Queen Donna Maria II. was established at Lisbon, I renewed our diplomatic relations with Portugal.

"In Spain, the death of King Ferdinand VII. has called the Princess his daughter to the throne. I hastened to acknowledge the Queen Isabella II., hoping that such prompt acknowledgement, and the relations it established between my Government and that of the Queen Regent, would contribute to preserve Spain from the miseries with which she was threatened. Already tranquillity is beginning to be restored to the provinces in which rebellion had broken out. The corps d'armée, which I have ordered to be formed, will protect our frontiers in any event.

"Continuing to be intimately united with Great Britain, we have every reason to hope that the difficulties which still retard the conclusion of a definite Treaty between the King of the Belgians and the King of the Netherlands, will compromise neither the great interests of Belgium nor the tranquillity of Europe.

"Switzerland has been momentarily disturbed by dissensions, which the prudent firmness of her Government in a short time appeared. I hastened to render her the services that she had a right to expect from a faithful and disinterested ally."

"The Ottoman Empire has been threatened with great perils. I was anxious to hasten a pacification at once called for by the interest of France, and the stability of European order. I shall continue my efforts to ensure its preservation."

"The events which I have just mentioned, and especially the situation of the Peninsula, have rendered it my duty to maintain the army upon the footing required by the safety of the State."

"Let us consummate our work, Gentlemen; let order, powerful and respected, be henceforth shielded from every attack. Let the efficacious protection of the national interests dissipate the last hopes of the factious, and France, happy and free under the tutelary shield of the Government she has founded, will at length pursue without obstacle the career of her prosperity. This is my most ardent wish, and you will assist in securing its accomplishment."

PARIS, DEC. 24.—"When the opposition Deputies entered the Chamber yesterday, the Ministerial members accosted them, and in great perturbation made them the most alarming recitals. The *Société des Droits de l'Homme*, they said, had, on the preceding evening, held a meeting, and resolved that one of its members should, after the delivery of the speech from the throne, rise, and declare that Louis Philip having, like Charles X., violated his oath, he had released every Frenchman from his allegiance. M. Vayer d'Argenson had excused himself from undertaking the task, which was then entrusted to M. Audry de Puyravcau, who had accepted it, and was to be seconded by M. d'Argenson. The deputies of the *Gauche*, on hearing the statement of this enormity, received it with ridicule, but could not dissipate the alarm of their colleagues of the *Centre*. Fortunately, a deputy, who is the friend of M. de P., on hearing the tale of scandal, informed them that the Honorable Deputy for the Charente Inferieure had not yet left his department. The alarm, however, had not subsided, and contributed to increase the acclamation when the King entered the Chamber. This news promulgated in the Chamber, was circulated throughout the day before. It is probable that Count d'Argout suffered himself to be abused by some stupid report of the Police, and gave credit to it without making any inquiries as to its truth."

HAVRE, DEC. 22.—The westerly winds that have constantly prevailed for the last six weeks, have kept upwards of fifty vessels of different descriptions completely bound in the port, and on the first favorable change, we shall have the sight of a large fleet leaving our harbor. The weather continued very tempestuous throughout last night, the gale blowing at times with very great violence, but this morning it has subsided, though the sea continues to roll very heavily."

SPAIN.

PARIS, DEC. 25.—The following intelligence, from Madrid, is of the 13th inst. :—"Tranquillity is far from being re-established; on the contrary, the insurrection is becoming more general. In every direction, the public spirit is showing itself more hostile to the Government of the Queen; on one side the Liberal party, with its importunities, and on the other masses of fanatics, following the instigations of the ecclesiastics, who seduce and excite them. The Government is moving in five different directions, for each Minister has a policy of his own; consequently it is impossible that there can be any accord in the system. The Prime Minister is in favor of resistance, or even of reaction—he of the *Fomento* (Interior) for a progressive improvement of the administration of the country; hence the late territorial division, and hence by a decree of the 10th inst., a free commerce in silk, paper, soap, cloths and other articles, has been adopted."

The Minister of the Finances confines himself entirely to his department, and intends to introduce important improvements; the Minister of War, more enlightened than the others, is forming the army upon the Constitutional basis, being the officer who, in 1832, at Cadiz, had the direction of the staff till Ferdinand was released. The Minister of Justice, in order to do nothing that may compromise himself, holds to the *statu quo* of his predecessors. And all this is done in the presence of a Council of Government directed by the Marquis de las Amarillas, which frequently renders the Royal power uneasy because it is supported by the public, and increases its influence in proportion to the unpopularity of M. Zes. At Aranjuez disturbances have become so serious as to warrant the appointment of a Governor

with unlimited powers, as in a state of siege. The officer appointed is Major Don Manuel Pinto, who has set out already, accompanied by an Advocate, and who is to act as his counsellor in the Courts Martial that are to be holden."

The Queen, wishing to hunt in the forest of Vignuela, was obliged to surround herself with troops in order to ensure her personal safety. At Almodovar, a band of 350 men are moving about the country, proclaiming Don Carlos. At Agadete, a monastery has been converted into barracks for Carlist insurgents. At Fuente del Ropel and Castro Gonzalo, Carlist soldiers have been seen taking the road to Portugal, probably to join Don Carlos. At Olmeda the Volunteers who escaped from Madrid have been overtaken and dispersed by the Queen's troops. At Jenes sixty Carlists having attempted to gain possession of some property belonging to the Queen; the burgers have been armed as a means of protection. At Valderroble and Calacette some considerable columns of Carlists are said to have been attacked by Gen. Carastala. At Elda and Petrer the Carlists have been endeavoring to stir up the people, but Col. Jartes, who on the 5th was at Infantes, was preparing to attack them. In La Mancha, El Locho is at the head of the insurrection which has proclaimed Don Carlos. In this country are also the bands of Sedillo and Barba.

At Cabrerros and Naval Carnero in the very environs of the capital, bands of Carlists audaciously parade about; they are paid and protected by the Convent of Guisando. On the second instant the Bishop of Leon omitted the town of Caratellos in order to join Don Carlos, taking the direction of Carcion. Troops have been sent against the Convent of Matallana, one of the principal promoters of the rebellion. The accounts from Bilbao and Biscay, are much more favorable to the Queen's cause. Don Vincent Sancher Salvadoz has been appointed Military Governor ad interim of Badajoz. At Seville, a Carlist plot has been discovered and many arrests have been made, and the Prefect of Police at Santa Cruz, has been obliged to place many of the most distinguished inhabitants of the town in secret confinement. A great many officers of the Regiment de la Reyna who were in garrison there have deserted and fled to join Don Carlos in Portugal. At Riofrio the chief Balmaseda is proclaiming Don Carlos at every point. On the 4th, he took from the Royal Depot at Sigüenza, ten thousand uniforms for 365 men, and seventeen muskets. At Butares the Carlist Chief Vargas has been surprised, taken and shot, but his followers continue to devastate the country.

At Valencia the whole country is filled with Carlist bands, but the high road is not occupied by them. General San Martin is shortly expected to arrive in the province and put them down. At Burgos, on the 5th, several Carlist chiefs were shot. This part of the kingdom is remarked for its fanaticism. The rebel leader, Carnicer, is at Becete with 300 armed men. This is a general view of our situation, which can scarcely be considered as an advantageous one, when the difficulties it throws in the way of collecting taxes, and providing the Government with the means of putting down the insurrection are taken into the account. Under these circumstances, the announcement of the retreat of M. Remisa, the Director-General of the Treasury, is not without importance. It is reported that he will be succeeded by M. Gargollo, Director of the Sinking Fund." Another letter from Madrid of the same date gives the following :—"M. Burgos, the Minister of the Interior, has been honored with the Grand Cordon of the Order of Isabella the Catholic."

M. Latre, Prefect of Police at Madrid, has been promoted to the rank of Major in the Royal Army. He was one of the Deputies to the Cortes in 1830.—M. Clemencin, formerly Minister to the Cortes, has been appointed Librarian to the Queen, in the room of M. Fernandez, deceased. All these acts partake of the movement, which M. Zes wished to avoid by his manifesto and circular letter. M. Burgos has conciliated the nobility by investing them with employments. As to the Count de Florida Blanca, he is opposing the Ministry with great adroitness, and gaining popularity by demanding, not a system of anarchy, but a wise, just, and enlightened administration. At the same time the Carlists are not discouraged."

Extract of a letter of the 26th inst. from Bayonne :—"One of the Secretaries of the French Embassy at Madrid arrived here yesterday, having been stopped and robbed by the Carlists at Villa Real. The mail, which left here on the 16th for Madrid, has also been stopped at Villa Real. The letters were taken out, and the passengers robbed."

The *Estrella*, a Madrid paper of the 8th instant, says—"A steam vessel, a frigate, two brigantines, and two transports, all belonging to Don Pedro, have arrived at Faro el Lago, and landed 1800 men, between 80 and 100 horse, and a large quantity of ammunition and provisions." The same journal also contains the following :—"It appears that 700 horses, with several artillery wagons, and about 60 other carriages belonging to the army of Don Miguel, have arrived at Valencia de Minho. They retreated in consequence of the late affairs in the environs of Oporto."

TURKEY.

SMYRNA, NOV. 16.—The number of European ships of war stationed in our seas, is increased every day. Sir Pultney Malcolm sailed hence yesterday for Vourla, where the greater part of his squadron is assembled, and where he will receive the reinforcement sent him from England. The British admiral will not quit that port until he receives fresh instructions from his Government, which he expects next week by the Salamander steam-packet. Ali is too powerful; it is thought, however, that this state of things cannot last long; and that Mehmet Ali himself, seeing the impossibility of establishing a monopoly in Crete, as he has done in Egypt, and as he may do perhaps in Syria, will give a possession which can only be injurious to him. It is said that the regiment last arrived, of 3,200 men, will relieve the Albanian troops in their cantonments. The Egyptian Admiral, Osman Pacha, is still off Sunda, with two ships of the line of 100 guns, one of 84, and a frigate of 60. An Egyptian sloop of war was lost in a storm on our coast a fortnight ago, with all the crew, 27 in number.

VIENNA, DEC. 17.—We learn from Odessa that several ships of war are fitting out in the ports of the Black Sea, a proof of a fixed resolution to be ready to meet events. The commercial world is in the meantime, no ways uneasy as to the interruption of peace, hoping to see those differences between the Great powers speedily arranged, and a general disarmament follow.

CONSTANTINOPLE, NOV. 12.—The Ottoman fleet is disarming, and will, as soon as the Sultan has returned to his palace at Therapia, leave the roads of Beschikash to return to the arsenal.

The *Hamburg Correspondent* says : The answer of the French Cabinet to the Note from that of Russia, respecting the affairs of Turkey, is, it is said, very strong, and the reply from Russia still more so. If as is believed possible, the French Ministry, in order to gain favor with the Chambers, should publish its answer, the reply of the Russian Government must also appear before the world.

HUMAN FATE.

A little child, a little child,
Upon its mother's knee,
With dimpled cheek, and laughing eye,
A holy sight to see.
A thoughtless boy, a thoughtless boy,
A truant from the school,
Urging his tiny wooden sloop
On through the glassy pool.
A musing youth, a musing youth,
With eyes fixed on a book,
Where he but sees his mistress' face
In her last farewell look.
A gay gallant, a gay gallant,
Hero of club and ball;
His father's pride, his mother's joy,
Admired and loved of all.
A traveller, a traveller,
Returned from foreign strand,
With store of wisdom, culled with care,
For use in his own land.
A happy man, a happy man,
With wife and children round,
And smiling friends, and cheerful home,
Where all pure joys abound.
A patriot, a patriot,
Intent on public good,
Who, in a court's ordeal tried,
Corruption's bait withstood.
A man of woe, a man of woe,
Bankrupt in heart and wealth—
Wife, children, hopes, all in the grave,
A bankrupt, too, in health.
A misanthrope, a misanthrope,
Disgusted with mankind,
Deserted by deceitful friends,
Whom favors could not bind.
A lunatic, a lunatic,
In melancholy mood,
Shrinking from every living thing—
Sighing in solitude.
A burial, a burial,
With none of kin to weep,
And lay the old man 'neath the sod,
To take his last long sleep.
Strange companie, strange companie,
Are these to meet, I woe!
Alas! they are but life's changes,
That in ONE MAN are seen!

RAILROAD CAR WHEELS, BOXES AND

AND OTHER RAILROAD CASTINGS.
Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 69 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.
Jas ROGERS, KETCHUM & GROSVENOR.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J34tr

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against ice, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and derided by the public as unmindful of safety. Apply, post paid. S1 R J M M & F

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of saw-machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 16, 1833. A20 R M & F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,
300 do. 1 1/2 do. do.
40 do. 1 1/2 do. do.
900 do. 2 do. do.
800 do. 2 1/2 do. do.
soon expected.

Flat Bars in lengths of 14 to 18 feet counter sunk holes, end cut at an angle of 45 degrees with splicing plates, nails to suit.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.
Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000.

The above will be sold free of duty, to State Governments, and incorporated Governments, and the Drawback taken in part payment.
A. & G. RALSTON,
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.
By order of the Company.

WILLIAM NORRIS, Secretary.

December 24, 1833.
For further information on this subject see No. 46, page 775 of this Journal.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber.
D. K. MINOR, 35 Wall street.
New-York, August 14, 1833.

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 3d street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWIN & HEARTY, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewin & Hartly.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833

To Messrs Ewin and Hartly.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will have ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1823, by his caveat filed in the Patent Office. Apply, post paid. S1 R J M M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Esq. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania. Hudson, Columbia county, New-York, {
January 29, 1833.

ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzel, Vellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thorburn is also Agent for the following publications, to wit—

NEW YORK FARMER and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYOR'S INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments manufactured and sold by E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad, I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad. Germantown, and Norristown Railroad.

m1 ly

[From English papers.]

St. SIMONIANS.—M. Prati is continuing his lectures on St. Simonism at the Burton Rooms. We went yesterday evening to hear him, but we found that he said little or nothing which we have not given before in our notices of his former lectures. The chief topic last evening was the emancipation of women, which was to be brought about by education. Women were to receive the same education as men, and if they did they would be found equal to men in every thing that required mental faculties only. He had studied Gall, and phrenologically examined many women's heads, whose organs, save that of combativeness (Query—did he ever examine the Amazonian heads of the ladies of St. Gile's and Billingsgate?) were even more fully developed than those of men. From that he concluded, that if they received a proper education, they would excel men in the Arts and Sciences, and become equally if not more capable of directing industry, upon which his system is chiefly founded. He, therefore, hoped to see in the new arrangement of society, women great politicians, deeply scientific, and surpassing in the fine arts. He exhorted the ladies present, (there were few old ones who came to hear him) to apply themselves to study; and he assured them, if they did so, they would soon become equal to men, and be no longer subject to them. He counselled them to despise the epithets of "blue stockings and learned ladies," which the tyrant man applied to them merely to keep them in a state of subjection. He called upon them most emphatically to form an association for the emancipation of females, which would become not only the school of their own emancipation but of that of all mankind. Women were always benevolent and good, and the great Poet, who wrote the most offensive lines against them, could not at last help avowing that women were Samaritans in every situation. A great servile war was at hand unless women stepped in as did the Sabine women of yore, and preached and practised reconciliation. If they would apply themselves to study and emancipate themselves, they would speedily smooth down the roughness of man, and create a new heaven upon earth.

A gentleman here asked whether the St. Simonians intended to sweep away the present order of things; what was to be the form of their new government; and what places women were appointed to fill in it?

M. Prati said, the St. Simonians intended to sweep away nothing, but that the present state of things would sink under its own rottenness. The form of their government was to be a hierarchy—not an hereditary one—founded on nature, in which those of the greatest capacity would pre- side. The station appointed to woman would be that her capacity entitled her to. She might fill any situation which did not require great strength and muscular exertion.

Another Gentleman asked whether women were to command ships.

M. Prati. Oh certainly!

The same Gentleman. Do you also intend to man your ships with women [laughter]?

M. Prati. Not exactly; there may be half men and half women—that would make the voyage pleasant; but, on reflection, I think it would be better that there should be no women at all, since the employment of a sailor requires great muscular exertion. Women are to be captains and commanders, but not common sailors.

A general discussion then took place between the persons present on the form of government, the distribution of property, and the rights of women.—Though we paid great attention, we could not understand the different theories, nor, we believe, did the disputants themselves, since the matter ended in a general challenge, to be decided some day next week.

PRINCE TALLEYRAND: *Anecdotes.*—During a part of the time when Prince Talleyrand was an emigrant, he was reduced to so much want, that he was even obliged to sell a valuable watch. "I know a gentleman," said the Marquis d'Assigny to the prince, "who will lend you a few hundred crowns. I yesterday heard him say, in the presence of two opulent English merchants, that he always keeps two thousand crowns to serve his friends." "You are laboring, I apprehend," replied the prince, "under a mistake; if he lent me this money, he would no longer keep it."

"What is your opinion respecting Mr. Nugent, a very witty old man?" said a friend to Prince Talleyrand. "He always puts me in mind of an antique chateau haunted by spirits—dans lequel il revient des esprits."

The Countess de —, whose amours formed a general subject of conversation, was blamed in very severe terms by a certain lady, in the hearing of Talleyrand. "I cannot entirely agree with you," said the prince; "the countess is merely enjoying the loss of her reputation."

"I was standing on the Pont Royal one evening," said Talleyrand; "a splendid carriage passed, in which was La Tour, the commissary-in-chief of the army, who had been a footman. 'Do you know who that person is?' cried a fish-woman to her comrade. 'Yes,' replied the latter; 'he is a *ci-devant* *derrière*.'"

Mlle. Fanny S—, a very lovely girl, had been the greater part of the evening in earnest conversation with a young clergyman, remarkable for his handsome person. When the latter had taken his leave, the young lady said to the prince that she had been much edited, and that the congregation—

"Flock, you intend to say, Miss—. I suspect our friend to be more of a shepherd than a pastor."

"He relates an anecdote extremely well," said Mr. B., speaking of Count Daru; "but half the stories he recounts are untrue, although they have the appearance of probability. What satisfaction can he derive in deceiving us?" "That pleasure," said the prince, "which a man experiences in making others believe what he does not believe himself."

A discussion arose respecting certain usages among different nations. "They may all be traced to some motive," said Lally Tollendal. "Why, then, said a gentleman, 'do the French, in driving their vehicles, give and take the left? In a drawing-room, you always give the right: you cede the right upon all occasions when you intend to shew deference to a person.' "It is quite clear," said T. "that the English are better whips than we; if there were no other reason than this, it would show that we are in the wrong. The riders sit on the right, and are, of course, able to see how near the wheels can approach each other. Talking of right and left, as far as etiquette and precedence are concerned, recalls to me a saying of Madame Palatine de Bavière, the abbess of Maubuisson. Another abbess, who was about to pay her a visit, sent to inquire if the right would be given to her. 'Ever since I have been a nun,' replied Madame Palatine, 'the only difference I know between the right and the left is in making the sign of the cross.'"

* * At the commencement of the last year I offered to send the American *tri-weekly* instead of *semi-weekly*, together with two of my periodicals, in exchange to those who would publish my advertisements of the different periodicals. In consequence of this notice, the exchange list was increased to 165. I soon found that the expense would be greater than I had anticipated, yet I had made the offer, and would of course continue it through the year—as I have done. I however find it *too expensive* to continue to send as heretofore. The circulation of my PERIODICALS, (upon which the expense falls,) will not warrant it, and I must, therefore, notwithstanding the uniform kindness with which they have been treated by those to whom they have been sent, materially reduce their exchange list.

The *semi-weekly* American will hereafter be sent in exchange to those who will publish the following advertisements a few weeks for the difference of price. *New-York, January 20, 1834.*

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in *semi-monthly* form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher

of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

D. K. Minor also publishes the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

List of Subscribers to the Railroad Journal who have paid in advance to Jan. 1, 1835, —continued from February 8, 1834.

A scientific person versed in Mechanics, Chemistry and Mineralogy, of several years practical experience in different branches of Civil Engineering, and who is also a good draughtsman, is desirous of obtaining employment either as an instructor in some public institution, or as an Engineer upon some private or public work.

He was educated at one of the first scientific institutions in the United States, and was for several years an instructor in the said institution.

A line addressed to B. at Railroad Journal Office, No. 35 Wall street, will meet with immediate attention. J. H. B.

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 222 Water street, New-York; A. M. Jones, Philadelphia; T. Janvics, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

J. H. B.

H. BURDEN.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MARCH 1, 1834.

In reply to the oft repeated inquiry "has Mr. Vignolle's promised article on Roads and Railroads yet appeared," we can only say that it has not, but we hope soon to receive it.

The letter of L. B. W., of Fort Wayne, Ia. is received, and his request attended to, relative to C. G. V. The paper containing the communication to which he alludes, has not been received. We are obliged to him for his suggestion relative to a tabular view of all the railroads in the United States. The propriety and utility of such a measure has more than once occurred to us, but hitherto we have been unable to obtain the necessary information, and for the present, other engagements do not admit of our undertaking the compilation. We shall endeavor, however, in the course of the present volume, to present our readers with a list of railroads in the United States, with a statement of their length, mode of construction, cost, &c. &c., and shall, therefore, be obliged to those engaged in their superintendence, to give us data for the purpose.

Locomotive Engines—Historical Retrospect. Compiled from the Report of the Committee of the House of Commons, of August, 1831. [From the London Mechanics' Magazine.]

The first locomotive engine was invented twenty-eight years ago, by the late Mr. Trevithick, a very ingenious man, and subsequently improved and used by Mr. Blenkinsop and others, for the service of collieries.

Mr. Gurney stated that his carriage weighed only 2½ tons; that in 1825 he began to work it; that in 1826 he went up Highgate and other hills; and in 1827 he went to Bath. That he has run 18 to 20 miles an hour.

that he is able to compete with the coaches, with an advantage, as 2½ 10s. to 15s. per hundred miles.

that he makes no noise.

N. B.—Mr. G. run his carriage for some time between Cheltenham and Gloucester, to the great loss of his supporters, Sir Charles Dance and others.

Mr. Hancock stated that his carriage weighed 3½ tons, that, with a piston of 9 inches, he has worked at 400 lbs., and on an average at from 60 to 100 lbs. on the square inch; consequently, could exert a power of 13 to 90 horses. that he makes only one-third of the noise of others.

Mr. Farey stated that Mr. Hancock and the Messrs. Heaton were the only candidates likely to prove successful.

suggested that there should be 2 horses at every hill, for the help of these locomotives. stated that passengers were annoyed from heat, noise, smoke, and dust.

condemns Gurney's, &c.

N. B.—The Messrs. Heaton, residing at Birmingham, were not examined.

Mr. Ogle stated that his engine is 20 horse power, with a pressure of 250 lbs. on the square inch. that his carriage weighs 3 tons. has gone at the rate of 32 to 40 miles per hour—and has ascended hills at the rate of 164 miles per hour. explosion impossible.

he is on the point of establishing a factory, so great are the demands for his carriage!

Mr. Gibbs was very sanguine in his hopes of success—proposed to plough, and drive vans.

Mr. Summers (the partner of Mr. Ogle) stated that they had constructed 2 carriages, weighing 3½ tons, besides passengers. that they had carried 9 persons at the rate of 9 miles, when the crank broke, and the carriage was sent back by canal. has carried 19 persons at the rate of 10 miles. has travelled at the rate of 30 miles during 4½ hours frequently; consequently 135 miles in 4½ hours.* has ascended Shirley-hill, which is 1 foot in 6.

Such was the state of the locomotives in 1831.

Observations.—In 1833, Mr. Gurney, the most persevering of all the competitors, is beaten out of the field, to his great cost.

Sir Charles Dance, his substitute, has run many times to Croydon and Greenwich—made an attempt to go to Birmingham, in which he failed—and made, lastly, an attempt to run daily to Clapham, in which also he has failed.

Messrs. Hancock, Ogle, Gibbs, Summers, and Heaton, are all in movement, but merely by convulsive starts; although they are provided with powers that may be raised to twenty, thirty, forty, and eighty horse power.

About twenty years have passed away in experi-

* Mr. Summers afterwards explained that what he meant to say was, that he had travelled "for the space of four miles and a half—not four hours and a half—at the rate of thirty miles an hour."—[Ed. M. M.]

ments, and not less, probably, than 100,000l. have been expended upon them; yet, after all, nothing effectual has been done.

At one period steam guns were the terror of many: they were to have mowed down whole ranks of infantry and cavalry; even artillery were to be quite impotent before them; but nobody now hears or dreams of such things. It would almost seem as if steam-carriages were destined to run the same course. The writer hopes not; but if he were to look for grounds to anticipate a different result, it would not be in any of the prospectuses for steam-carriage companies that he has seen, of which the best that can be said is, that they circulate much easier than the wheels of the carriages that they respectively extol to the skies.

A. FRENCHMAN.

List of Steam Coaches and Drags now building and built in London and its Vicinity.

We have been favored with this list by a correspondent, who states that its "accuracy may be depended on." We really had no idea that there were so many locomotive competitors in the field.—[Ed. M. M.]

Hancock 1	Infant, his own, built, experimental one.
Ditto 2	Era, (for a company,) built.
Ditto 3	Enterprise, (ditto,) built.
Ditto 5	a new one now building, his own
Ditto 4	Autopsy, his own, built.
Gurney, Mauda.	} 1	a drag, built and altered by the
ley, Stone, and Gibbs		said engineers, for Sir C. Dance, Knight.
Ogle 1	a carriage, his own, built, experimental one.
Squire 1	a carriage, himself and others, experimental one.
Frazer 1	a carriage, himself and others, building, experimental one.
Gibbs & Applegath	1	a drag, themselves, experimental one, built.
Gatfield and Bower	1	a drag, themselves, experimental one, building.
Andrew Smith	.. 1	a drag, (for Mr. King,) experimental one, building.
Palmer 1	a drag, his own, experimental one, built.
Redmund 1	a carriage, experimental one, building.
Manting, Joseph	.. 1	a carriage, his own, experimental one, building.
Phillips & Co.	.. 1	a carriage, their own, experimental one, building.
Silk 1	a carriage, his own, experimental one, building.
Smith and Co.	.. 1	a carriage, (for company,) experimental one, building.
Mile-end (name not known) }	a carriage, (for company,) experimental one, building.

STEAM TRAVELLING.—A company has been just established to run steam-coaches in various parts of England. The capital of the company is to be £350,000. They have ordered fifty coaches to be built at Birmingham and six at Maudsley's. Sir H. Parnell is the chairman of the company.

Report of the Board of Directors of the Pontchartrain Railroad Company, to the Stockholders, at their meeting of December 2, 1833.

Office of Pontchartrain Railroad Co.
New-Orleans, Dec. 2, 1833.

TO THE STOCKHOLDERS:

I am instructed by the board of directors to lay before you the following statements:

1. Statement of the affairs of the company on the 30th of November ult.

2. Comparative statements of receipts for 1831, '32, and '33.

3. Statement of the machinery ordered, and of the work required for the completion of the road, and their probable cost.

By statement No. 1, it will be seen that the rail track, harbor, machinery, real estate, negroes, &c. &c., have cost - \$443,433 76

To which may be added the additional amount required for machinery, and the completion of the road, say - - - 18,600 00

Making the total cost of the road, independent of current expenses \$462,033 76

The same statement shows the debts of the company are as follows:

Bills payable, due in 1834 - \$37,419 36

" " 1835 - 5,085 00

Due to sundries - - - 3,000 00

Bonds in favor of the City Bank, payable in 1837, '42, and '47 - 50,000 00

\$100,504 36

Their available means are as follows:

Bills receivable, due in 1834, '35, '36, and '37 - - - \$19,826 14

Amount due by sundries - - - 5,257 01

Cash on hand - - - 3,627 77

Sinking fund to meet the reimbursement of bonds - - - 3,484 00

\$32,194 92

Amount due on the Darcantel property, and in suit, about \$40,000 00

The second statement shows that the receipts of the company, since the commencement of their operations, have been as follows:

For 1831 - - - - \$16,141 01

" 1832 - - - - 44,101 15

" 1833 - - - - 75,929 25

The third statement enumerates the machinery ordered, and the works required for the completion of the road and harbor, and their probable cost.

SUMMARY.

Capital stock of the company - \$250,000 00

Cost of works, including probable amount required for their completion, &c. as per statement \$462,033 76

DEBTS OF THE COMPANY FOR 1834.

Amount due as above - - - \$37,419 36

Probable cost of the machinery ordered, and works required for the completion of the road - 18,600 00

Probable current expenses, - - - 30,000 00

Interest on bonds - - - 4,000 00

Due to sundries - - - 8,000 00

\$98,019 36

AVAILABLES FOR 1834.

Bills receivable - - - - \$3,077 53

Cash - - - - 3,627 77

Return duties on rails, when laid - 2,000 00

Rent of hotels and bath houses - 4,200 00

Due by sundries - - - 5,257 01

Probable receipts; suppose the same amount as in 1833 - - - 75,929 25

\$94,091 56

It is confidently expected that the balance of bills receivable, and the amount due on the Darcantel property, will more than suffice to

redeem the bonds issued in favor of the City Bank.

It may be well to observe here, that the real property of the company is put down at cost, while it is worth more than double the amount.

The cholera and yellow fever, during the last summer, have certainly reduced the receipts of the company upwards of twenty thousand dollars; it is, therefore, not unreasonable to suppose, that the increase in the receipts for 1834 will be at least in the same ratio as the previous years, when the track and harbor were in an unfinished state, and the whole works covered with mechanics and laborers. Should this be the case, the company will be enabled to complete their works, extinguish their debts, and give a good dividend at the close of the coming year.

During the present year the following works have been completed, to wit:

1. The harbor, with the exception of a small part of the breakwater.

2. A large car house.

3. An engine house.

4. Double and treble tracks at both ends of the road, to facilitate the arrival and departure of the cars.

5. A large platform to avoid manual labor in loading the cars at the city end of the track.

6. Ten new cars for passengers.

7. The Venetian blinds of the Washington Hotel.

8. Filled up a large extent of the company's property, thereby trebling its value.

9. A bath house for the people of color.

And the company have bought or imported the following machinery:

1. The locomotive engine Creole, and a large number of freight cars.

2. A lathe, and the necessary tools for the engines and forge.

3. A drudging machine.

The drudging machine has the double advantage of preserving a proper depth of water in the harbor, and of supplying the company with materials to fill up their lots, thereby greatly increasing the value and utility of both; about fourteen thousand superficial feet have already been filled up.

The company is now amply supplied with all the machinery required for the transportation of freight and passengers. A third locomotive engine has been ordered, to prevent the possibility of a stoppage; and the forge is provided with lathes and the necessary tools to keep the machinery in proper order, and to repair any part of the engines which may give way.

A few months will now suffice for the completion of the whole works; the board of directors will then be enabled to direct their undivided attention to the proper application of the immense mechanical power under their control. I am, very respectfully, your obedient servant,

JOHN HEWLETT, President.

UNDULATING RAILWAYS have attracted much attention and discussion in England. The inventor, Mr. Badnall, has met with great opposition from various sources; he has, however, steadily pursued his labors in perfecting his invention, and at the same time kept up a controversy, always in a gentlemanly, yet decided tone, with his opponents, until he has demonstrated, by actual and repeated experiments, its entire practicability. So well, indeed, has he satisfied those who have witnessed his experiments, that Mr. Stephenson, the distinguished engineer of the Liverpool and Manchester Railroad, has joined him as a partner in civil engineering.

In Nos. 46 and 50 of Vol. 2, we gave, from a London paper, some account of experiments made on the Liverpool and Manchester Railway

by Mr. Badnall, to test the correctness of the undulating principle as contended for by him.

They were not, however, given at length in the London paper, and therefore we re-publish them from the London Mechanics' Magazine, as given by Mr. Badnall himself, and we shall publish several articles from the Mechanics' Magazine, to explain more fully Mr. Badnall's views and theory, that the subject may receive in this country the consideration which its importance demands.

Further Experiments on the Liverpool and Manchester Railway, to determine the correctness of the Undulating Railway System.

SIR,—Since I had last the pleasure of addressing you, we have been enabled to try some further experiments on the Liverpool and Manchester railway, the decisive result of which will, I doubt not, fully establish, in your mind and in the public opinion, the merits of the undulating principle.

On Wednesday last, the 16th instant, we met as before on the Sutton inclined plane. On this occasion it was agreed by the engineers present, viz., Mr. Robert Stephenson, sen., the Messrs. Dixons, Mr. Dagleish, and myself, that the truth and validity of the principle, as well as the comparative advantage to be derived from its adoption, would be effectually determined by the following test:

As great a velocity as possible being attained by the engine and load, before reaching a given point near the foot of the inclined plane, the time was to be accurately ascertained which the train occupied in ascending from that point to a state of rest.

The power being thus reversed, the time was to be accurately measured which the train occupied in descending from a state of rest to the point from which it had previously ascended.

Hence it would be obvious, that if the descent were made in less time than the ascent, the velocity generated at the foot of the plane would be proportionably greater than the velocity of the ascending train at the same point, and, consequently, the demonstration would be clear that the engine and train would not only have ascended to an opposite elevation equal to that from whence it fell, but to a greater one, the extent of which would be in proportion to the velocity attained.

Experiment 1.—The "Liver" engine, and a load of thirteen waggons (weighing in all 72½ tons,) after traversing a distance of three-fourths of a mile to acquire a sufficient velocity, ascended the inclined plane 278 yards, the time occupied in performing the ascent to a state of rest being 90 seconds, viz. velocity at foot of plane being about 12.60 miles per hour, and the average velocity about 6.30 miles per hour.

Experiment 2.—The power being reversed the engine and train descended 278 yards, viz. from a state of rest to the point from which they had previously risen, in 50 seconds. The velocity at the foot of the plane being about 22.70 miles per hour—average velocity about 11.35 miles.

Experiment 3.—The engine and train having traversed ¼ mile to generate velocity, ascended to a state of rest, viz. about 278 yards in 75 seconds. Velocity at the foot of the plane being about 14.12 miles per hour—average velocity about 7.6 miles.

Experiment 4.—The power being reversed, the descent of 278 yards was accomplished in 40 seconds. Velocity at the foot of the plane being about 23.32 miles per hour—average velocity 14.16 miles.

Experiment 5.—The ascent of 278 yards was made in 80 seconds. Velocity at the foot of the plane being about 14.22 miles per hour—average velocity 7.11 miles per hour.

Experiment 6.—The descent of 278 yards was accomplished in 49 seconds. Velocity at the foot of the plane being about 23.22 miles per hour—average velocity about 11.61 miles per hour.

AVERAGE.		
Total spaces passed over to generate maximum velocity before ascending.	Times occupied in ascending 278 yards.	
Experiment 1.....1,320 yards.....	90 seconds.	
Experiment 3.....1,320 yards.....	75 seconds.

Total, 13,960 yards.....	245 seconds.	
Average, 1,320 yards.....	81½ seconds.	
Total spaces passed over in generating maximum velocity in descending.	Times occupied in descending 278 yards.	
Experiment 2.....278 yards.....	50 seconds.	
Experiment 4.....278 yards.....	40 seconds.	
Experiment 6.....278 yards.....	49 seconds.	
834 yards.....	139 seconds.	
278 yards.....	46½ seconds.	

From the preceding statement it appears, that the utmost average maximum velocity which the Liver engine could attain on this occasion, at the foot of the plane, after traversing a distance of 1,320 yards, was about 13.926 miles an hour; by which means, the power being continued, she was enabled to ascend an inclination of 278 yards.

On the other hand, it appears that the same engine, with the same load, (the steam being kept up in every instance to a pressure of about 50 lbs. to the inch,) generated a velocity, after descending 278 yards, of about 24.488* miles per hour, evidently proving that the engine and train would not only have mounted another summit of equal elevation to that from whence it fell, but would, at the highest point, have been travelling at a velocity of more than ten miles an hour, with the full means of increasing that velocity to any desired extent over the succeeding undulations.

Although the preceding experiments had, to the satisfaction of all present, decided the superiority of the undulating principle, I was anxious to know the result of a trial with a double load. I therefore proposed (it being too late on hour on this occasion) to attain, on a future day, a velocity of twenty miles an hour, with a double train of goods and two engines. I had, on several occasions, published my opinion of what that result would be, and I have now the satisfaction of adding the particulars of this important experiment, which, I need not say, more than confirms all my anticipations.

On Sunday morning last two locomotive engines, viz. the "Firefly" and the "Pluto," left Manchester with a train of loaded waggons, weighing 150 tons, exclusive of engines and tenders, the whole length of the train being about 155 yards.

On arriving at the Sutton inclined plane, it was determined to adopt the same method as on the last trials, of proving the merits of the principle. Our reason for appointing Sunday for this meeting will be obvious, when it is considered how dangerous and inconvenient it would be to try experiments with such a load on any other day, when the trains are almost constantly passing and repassing.

It may be known to some of your readers, that the French government have lately appointed a certain number of their most eminent engineers to visit this country, with a view of acquiring all requisite information, preparatory to the construction of several intended French lines of railway.

These gentlemen, nine in number, were present on this occasion; their names were as follows: Mons. Navier; Mons. Goubeau, Juge-mont des Ponts et Chaussées; M. Arnollet, Ingenieur en chef du Ponts et Chaussées, a Dijon; M. Eugene Nuneann, Ingenieur des Ponts et Chaussées, No. 1 Rue Castiglione, Paris; Mons. Dausse; Mons. L. L. Vallee, Ingenieur en chef des Ponts et Chaussées; Mons. J. Moistard, In-

The velocity in these instances is calculated from the average number of seconds occupied in ascending and descending; thus, 278 yards being = about 61 of a mile, we have the descending line $46\frac{1}{2} \times 61 = 2834$ and $3,600 \text{ seconds} \div 2834 \times 2 = 24.488$ maximum velocity.

genieur de la Marine; Mons. Paris, Lieutenant de Vaisseau; Mons. K. Mamgan.

The English engineers present were Mr. R. Stephenson, sen., of Manchester, (with whom I have recently entered into partnership as civil engineers,) Mr. Dagleish, sen., Mr. Dixon, sen., Mr. Dagleish, jun., and myself. In addition to whom were many other individuals deeply interested in railways, and of general scientific acquirements, among whom were Mr. Case, of Summer-hill, near Liverpool, Mr. Garnett, of Manchester (editor of the *Guardian*), and others.

The following statement cannot fail to form an interesting part of your publication:

Experiment 1.—Two locomotive engines, the Firefly and the Pluto, being attached to the train above mentioned, and having traversed a distance of one mile, to generate a sufficient velocity, arrived at the point from whence the ascent was to be measured, at a velocity of about 20.28 miles per hour. The Pluto then left the train, and the Firefly alone ascended with the load (working the whole way) to a distance of 575 yards, 116 seconds—average velocity being about 10.14 miles an hour.

Experiment 2.—The power of the Firefly being reversed, the engine and load descended 575 yards in 74 seconds. The velocity at the foot of the plane being about 31.70 miles per hour—average velocity about 15.85 miles per hour.

Experiment 3.—The Firefly and Pluto having traversed the same distance as before, generated, at the foot of the plane, a velocity of about 14.34 miles per hour. The Pluto then left the train, and the Firefly and load ascended (power working) 315 yards in 90 seconds—average velocity about 7.17 miles per hour.

Experiment 4.—The power of the Firefly being reversed, the whole train descended 315 yards in 65 seconds. Maximum velocity 19.82—average velocity 9.91.

Experiment 5.—The same engines and load, working about $1\frac{1}{2}$ miles to generate velocity, attained at the foot of the plane a velocity of about 18.32 miles an hour. The Pluto left as before, and the Firefly and load rose 457½ yards in 102½ seconds—average velocity about 9.16 miles per hour.

Experiment 6.—The Firefly and train descended 457½ yards in 80 seconds. Maximum velocity 23.22 miles per hour—average velocity 11.61. N.B. In this instance some delay occurred in reversing the power, which will account for the comparative difference in time.

Throughout the whole of these experiments it will be seen the results were so much in favor of the undulating system, that it was evident a far greater load than 150 tons could be moved by the Firefly, at an average velocity of 15 miles per hour from one summit of a curve to another. The dip of inclination being about 1 in 99, and the total length of the undulation varying from 630 to 1,150 yards.

This led me to propose a further experiment, and I think I may safely add, that one more important in result was never before tried in any country.

Experiment 7.—The two engines, as before, attained at the foot of ascent a velocity of about 19.04 miles per hour. The Pluto then left the train, and, at the same moment, the Firefly shut off her steam. The whole train then rose by momentum alone (the weight of the train, including engine and tender, being near 164 tons,) to the distance of 323 yards in 70 seconds—average velocity about 9.52 miles per hour.

Experiment 8 and last.—The Firefly and train descended 323 yards (power working) in 66 seconds! Velocity at foot of the plane being about 20.04 miles per hour—average velocity about 10.02 miles per hour.

Thus the preceding experiments most unquestionably prove two most important facts—not only that a given locomotive power can convey from one summit of a curve or undulation, to another summit of equal altitude, double the load which that same power can convey at

the same velocity on the level; but that a given locomotive engine can convey, from one summit of a curve or undulation to another summit of equal altitude, double the load which it is capable of moving on a level at a like velocity (see last experiment), by the employment of the steam force throughout only half the distance!

These results lead me to go one step farther. It is my opinion, that if such a weight were to be added to the 150 tons moved on this occasion, as would be a maximum load for three locomotive engines on a level at 15 miles an hour, the Firefly alone (her power being equal to either of the other engines) would move the whole train from one summit of a curve to another of like altitude, at an equal average velocity, viz. 15 miles per hour.

If any of your readers, whether witnesses or otherwise of these interesting experiments, can correct any error of opinion or of statement in allusion to them, I shall be exceedingly happy to recognize and acknowledge it. In the mean time I think, Sir, I may congratulate myself upon having stamped, by this letter, a value that will be long appreciated on the correspondence (*pro* and *con.*) which your Magazine contains on this subject; and I am as happy in feeling that every individual who witnessed the recent experiments was fully satisfied with the importance of the results, as in believing that, in defiance of prejudice and long-formed erroneous opinions on this subject, the public will before long acknowledge, appreciate, and be benefitted by the "UNDULATING PRINCIPLE."

I am, sir, with great respect, your very obedient servant,
RICHARD BADNALL.

P. S.—I have not yet seen your last Number. "S. Y.'s" remarks in the previous one shall be noticed. In the mean time, he does me injustice in supposing I have ever indulged one contemptuous feeling toward him. I could not indulge it to a worm—much more to an individual whose good motives, in a scientific discussion, I have never questioned, and in answer to whose remarks I have bestowed time, attention, and labor.

The following communication, from Mr. J. L. Sullivan, refers to a subject of great importance to this country, and especially to this city. We have heard much of Mr. Blanchard's steamboat for ascending rapids in rivers, without ever having seen a description of it. The following communication will, we hope, attract the attention of those who are experienced in such matters, and have leisure to furnish us with their views for publication.

Blanchard's Allegany River Steamboat. [Communicated for the American Railroad Journal.]

To the Editor:

Sir,—If, in announcing the twin boat on Burden's plan, it could have been stated that it had run up rapids so heavy in descent that a canal had been actually made around them where the fall is in fact eight feet a mile, it would have been admitted that "a New Era" in steam navigation had indeed commenced; and this is but a correct description of the performance of *Blanchard's boat* on the Connecticut, between Hartford and Springfield, passing up Enfield falls, daily, the summer past.

This sort of steamboat is the same that has made a passage up to Olean Point from Pittsburgh. Others have since been built for constant business elsewhere: the Allegany route not yet being reached from New-York by the westward bound freight.

But I am led at this time to bring it into recollection and notice, as an interested party, from seeing, in one of your last numbers, mention of an improvement by Mr. Langdon, of Troy, in which some reliance appears to be placed on the principle of strength combined in Blanchard's patent; and more especially also, from seeing the purpose of Pennsylvania, avow-

ed by one of her Senators in Congress, to cut off all our western trade. There can be no question that such is the intention of Philadelphia, and there is much reason to fear that they are much nearer to effecting it than we are in New-York aware of.

The navigation of the Allegheny with light and powerful steamboats, together with an immediate connection of this river by a railroad with the Erie canal at Buffalo, could prevent it; and more effectually when the great railroad in contemplation from this city to the lake, touching the head of that river at Hamilton, shall be made; and then the branch to Buffalo, (50 miles,) would serve both to connect the canal with the river, and to connect that city with New-York by a good winter route.

I am not, however, the only interested party; all who wish New-York to retain a good share of the western trade must feel interested in the subject.

Having been on the Allegheny while a member of the United States Board of Engineers for Internal Improvement, and having been early in life practically engaged in improving river navigation, I then considered this route as of very great consequence to the commerce of New-York, and very easily made navigable for steamboats of a light draft of water; and when Blanchard's experiment thereon was announced, a few years later, sought and contracted for his services and the right of his invention exclusively for the companies I might form for its use; for others as well as for the Hudson and for the Delaware and Raritan canal trade, as permitting of an extensive communication with the southern waters—for if a short canal were made in North Carolina from Cape Fear river to the Waccamaw in South Carolina, and from Winyaw Bay to the Santee, and a marsh cut made around Bull's Bay, there would be steam navigation inland from New-York to Georgia.

The peculiarity of Blanchard's boat, which assures to it great speed, is the combination of means to construct a very light hull, having extraordinary vertical strength, so as to be able to carry a stern wheel, and much more than usual power in proportion to size. It may be said to combine ship carpentry and house carpentry with the principle of the arched bridge. This mode of construction, it will be seen by the prefixed sketch, distributes the stress over the whole fabric. A great vertical force may bear on the arc frames; and if much longitudinal impulse is received, it is at their extremities. Even the cylinders of the engine are borne by these arc frames; and the action and reaction of the power is all included within them. The shell of the hull buoys up or carries the machinery, without being relied on to bear any strain.

Suppose two arcs of a circle of which the

cord is rather longer than the length of the boat. Suppose them vertical and opposed, united at the extremities, and the curve preserved by braces in the form of an X; and that close to each brace a screw bolt ties the two arcs together, pressing on the ends of the braces, somewhat let in. Such a frame placed vertically would be immensely strong to resist perpendicular pressure. Two such frames, thus placed parallel to each other, resting on the floor timbers, and connected with the beams and ribs, makes a very stiff yet very light vessel; and the timber employed being acted on lengthwise, may be very small, yet abundantly strong in that position.

The frames or arcs project astern far enough to bear the wheel, the weight of which is sustained, consequently, by the whole of the hull, even to the head; and thus the wheel may be placed so as to act in the dead water of the wake, producing there much more effect than close up. The cylinders are horizontal, and connected with the arcs, which bear their weight and action. The boilers also are placed so as to be borne by the arcs; and if the boat is for canal use, they are in-board in rooms separated by a very strong *glancing shield*, to guard against explosions, though otherwise effectually guarded against. If for rivers, they are placed on the guards, and outside of the shields. On rivers there may also be *side wheels*: and for rapids, where the current is too swift, Blanchard's invention to push or set the boat forward is applied. This is powerful enough even to lift while it pushes ahead, and is a combination very useful on the Ohio in a low state of the water.

This branch of navigation is becoming too extensive and valuable in our country not to have made safety a very important point. Besides the shield to glance off an explosion, the use of a float, with mechanism to ring a bell in the boiler itself, when the water gets too low, is another precaution: another, to cause similar machinery to open valves to give notice by steam: another, a self-regulator of the supply: another, to prevent sediment and concretions on the bottom, (of which I shall give you a description in a future article.) We have, besides, several improvements in the boiler to use anthracite, reducing the quantity so as to make it about one-third the expense of pine wood; so also as to apply the fire without internal flues.

The Allegheny boats can use the coal of the upper branches of this river, as well as that obtained at Pittsburg. A branch railroad to Buffalo would carry coal to the lake boats. A twin boat would not be so safe for the Allegheny as a single one. The liability of a twin boat to strike aground, or against another vessel or obstacle, suddenly with one of the hulls, causes the momentum of the other (a force equal to

the weight thereof multiplied into its velocity) to rend itself separate. And two hulls that are so heavy as to sink, if filled, doubles the danger, because the sinking of one upsets the whole. Whatever depresses one more than the other, disturbs the steering; but a single hull may heel without diminishing the power of the helm.

It seems reasonable to think that a single hull, with very ample power, will be the swiftest vessel, because she may receive the form and proportions nearly which Nature gives to quick swimming fish. Naval architecture has taken this hint, and follows it out as far as is consistent with the stability of sailing vessels. One that is shaped the same at both ends, cannot sail as well as when gradually diminishing aft from the forward third. Since the resistance to the velocity is well known to increase in much higher ratio than the speed, the lighter the draft the greater promise of rapidity, as flat vessels sail fastest before the wind.

On a large scale, Blanchard's boat may have uncommon breadth and adaptation to the Ohio; and on the Hudson she may have both stern and side wheels. The more breadth of paddle applied, the less depth will be required, and the more advantageous the application. The cylinders may be upright for the side wheels, and horizontal for the stern wheel; all sustained by the arcs: and by thus distributing or dividing the power, more may be employed. The weight of an engine increases in a greater ratio than the power, therefore three engines would comprehend a greater proportion of power to weight, than one or two.

The resistance sustained by a body moving in a fluid, is proportioned to the square of its velocity, and the area of its section immersed. Whatever the shape of the vessel, her displacement of water must be a quantity equal to her weight. In point of draft, or section immersed, nothing is gained by a twin boat; but in point of resistance, something is lost. In his work on the Steam Engine, Mr. Renwick observes that "an obvious advantage will be gained by increasing the size of the vessels, for the resistances vary as the square of similar dimensions, while the tonnage increases with their cubes."

It is evident that a boat upon Blanchard's plan, as broad and long as Burden's, and 32 feet wide, would draw but half as much water, and present no more cross section; and while the resistance would be the same, minus the friction of two sides, she would have the advantages of not parting the water at so much depth, and of avoiding by her shape the retarding force following or occurring at the stern. Burden's are 8 feet diameter.

For these reasons mainly, which are in their nature, indisputable, I am led to think that Blanchard's kind of boat with stern and

side wheels must be very favorable to the effect of the power, since with that of the stern wheel only, they perform so well.

In reference to the commerce of the west, this steam-boat evidently possesses the properties demanded by the rapidity of some parts of the Allegany, and the shallowness of some parts of the Ohio in the summer season. It is of great consequence, indeed, that as the New-Orleans market is not much sought from the north at mid-summer, the western trade on the Ohio, the Cumberland and the Tennessee, and even the Missouri, may advantageously rely on a direct and cheap way to a northern port.

This route is the more important, since the avowed intention of Pennsylvania, because the hope cherished by some that a canal might be made or allowed by that state along the shore of the Allegany, cannot be expected, *contrary to the interest of Philadelphia.*

But it may be said here, as it has been said there, in the Quarterly Review, that the railroad from New-York to Allegany river, "will become a permanent portion of national wealth, and not only add to the comfort and riches of the present generation, but exert an influence upon the remotest posterity. Of all the sources of national wealth, internal commerce is not only the most secure, but the most productive. Nations that are merely agricultural are proverbially poor. It is far otherwise when the enterprise of the industrious is directed to every object."

"All the means which facilitate both personal communication, and a cheap and rapid interchange of commodities, are of the utmost value and importance: They have been so regarded by all enlightened nations; and in truth, the attention that has been paid to them is one of the surest criterions by which to judge of the advance a people has made in civilization. Progress in the Fine Arts is a far less certain indication of refinement than roads and inland navigation."

Such are the opinions entertained in Philadelphia, where practice evinces their acceptance throughout the state.

Permit me now briefly to consider the practical effect of this navigation of the Allegany combined with the use of the railroad from hence thither, in its way to lake Erie, compared with the useful effect of the railroad without these steamboats.

The lake being closed in the spring, nearly as late at Dunkirk, where the road will terminate, as at Buffalo, about two months more of lake navigation will belong to the communication through Pennsylvania; but as the Allegany and the Ohio are open earlier than the Pennsylvania canal can be, unless a very mild winter, much freight that would have gone by the way of Philadelphia to the central west, or to the centre of Ohio by the lake, will descend the Allegany and pass from Cincinnati north, in less time, and probably at less expense. The consequence will be that New-York retains her full share of the western commerce rather more advantageously than Pennsylvania can by her canal, though in a milder region.

Let us consider the distances and time, which I do with the more confidence from knowing the ground by observation.

It is most probable that this route will avail of the Harlem railroad as far as opposite Rockland, gaining the shore of Hudson by following that of Harlem river, and crossing, pass thence to Ramapo valley, (unless the Company should avail of the Paterson railroad to reach the same point, the ground being favorable; this, however, is leaving the state.)

To Ramapo may be called - - 35 miles.
Thence to Florida, in Orange, - 24 "
Thence by Deer Park Gap, in Shawangunk mountains, and across Sullivan county, to the Delaware, - 60 "
Up the Delaware - - - - 20 "
Across to the Susquehanna - - 16 "

Westward down along the Susquehanna, and up along the Chemung, - - - - - 110 "
Canestoe to Angelica - - - - 20 "
To Olean - - - - - 30 "
315 "

Thence by the Allegany to Pittsburgh, descending 2½ feet in a mile, in all 630 feet.

The time, at 8 miles an hour on the railroad, will be - - - - - 40 hours.
Down the river - - - - - 20 "
To Cincinnati, 439 miles, at 12 miles an hour - - - - - 37 "
97 "

In the spring of the year, when the water is high, the passage down must be even quicker, and the merchants are then solicitous to reach home early with their purchases.

In the autumn, after the 1st October, the Allegany will be deemed safer than the lake, and the river will be open later than the canal. There will be two months earlier access to the New-York market for produce from the west this way than by the lake.

It will be important that the boats be powerful. The speed of steam freighting, even on the Hudson, makes up for the cheapness and slowness of sloop navigation, which averages four days, while the tow-boats run the passage regularly in 24 hours. The navigation of the Allegany will be at least half as important to the state as the Hudson itself.

But no time is to be lost in defensive measures against the vigorous enterprise of Philadelphia. She will, if we delay, have accomplished her works, completed her system of interception, and bound the West to her capital in fetters of credit. The wishes even of the western people of that state will be frustrated. The expedient that will take least time, is to connect Erie canal at Buffalo with the bend of the Allegany in Cattaraugus, as our leading statesmen think. The distance is 50 miles, and one track might be soon made. But to wait for a canal to be made from Rochester to Olean, however useful the work, involves too much delay as a defensive measure.

This railroad might be considered a branch of the main line in reference to the winter travel, or practically so. To use again the language of the Quarterly Review, "A populous state, willing to pledge its resources for the redemption of loans, can alone command that confidence which will justify investment of the property of individuals, or what is of even more importance, will draw to our country the wealth of foreign capitalists."

This remark is applicable and encouraging to the southern states. Public investment may be compensated in the effects. Erie canal doubled the price of produce in the western counties. When such works are accomplished by public credit, the loans may be paid off by selling stock to private capitalists, who can then buy in, because immediate returns warrant it.

The difference between our country and others, is, that their resources are swallowed up in the necessity of maintaining large standing armies. Our country only wants cheap transportation to be prosperous. It has been well remarked, that "When a state enters into a system of internal improvement, if the completion of the public works shall add to the value of individual property as much as they cost, the state is no loser (if they receive no revenue); but if besides, they pay the interest of the cost, the whole expenditure becomes clear profit."

Humble as may be the instrument described in this article, it can hardly be doubted from experience thus far, that it really commences a "new era" in the art, when steamboats will conquer the difficulties of rapid rivers, and combining the means of safety, traverse the

great arc of the Union, from the head of the Allegany to the head of the Tennessee. For this reason an Albany company might commence this operation, if the railroad company should not do it in anticipation of the accomplishment of their work. J. L. SULLIVAN.

P. S. There has lately been an improvement in steam boilers, made by Mr. L. Disbrow, and owned by him and Joseph Goddard, Esq., and tested in the steamboat of the Delaware and Hudson Canal Company, by which there is a saving made, compared with wood, of 45 to 50 per cent. in the expense of fuel.

It consists of a number of conical furnaces, the base of which is the grate, the apices connected by a small flue. These all immersed in the water and half full of coal, make a steady and strong fire. They are fed near the top of the cones, by horizontal openings.

On the Preservation of Timber, &c. By A. B. [For the American Railroad Journal.]

SIR,—I will contribute a little of my experience, which satisfies me that the plan of the Black Rock railroad will answer well. In 1823 I laid a hemlock plank on the surface of ground, corresponding with a grade prepared for a railroad. Without grass or vegetation, dirt had accumulated so as to be about even with the upper surface, except at one end, which had become covered with gravel. Last season, after the plank had lain ten years, I had occasion to take it up. I expected to find the under side rotten, but found the whole plank as sound and hard as if it had been under cover. The use of it was to walk upon from the kitchen door. A. B.

RAILWAY BETWEEN AMSTERDAM AND COLOGNE.—The Prussian journals say that an iron railroad will be made between Amsterdam and Cologne, that the work will be confided to Lieut. Col. Bake, of the Dutch engineers, and that a Dutch civil engineer, named Braede, is already engaged in the preparatory surveys. The plan has already received the sanction of the kings of Prussia and the Netherlands.

PERCUSSION LOCKS FOR THE ARMY.—A committee, consisting of three officers of artillery, is now actively engaged at Woolwich in a course of practical experiments, of which the object is to ascertain the propriety, or otherwise, of introducing percussion locks for the army, in lieu of the present flint and steel. No report is, we hear, to be made to government till the firing of 24,000 rounds of cartridges shall have afforded grounds for a decided opinion.

WATER IN FLOUR.—Most important researches have recently been carried on in Paris by MM. Payen and Persoz, on the several points in the chemical history of bread, flour, and grain. Their observations are not yet published in detail; but we select the following as being one of the very highest commercial dietetic importance. They have found that 100 parts of flour, sold as dry, and imparting no moist stain to blotting paper, contain, under atmospheric circumstances, 19 per cent. of water, and but 89 of dry nutritive matter; that flour exposed to moist air contains as much as 23 per cent. of water; that the finest flour employed by the bakers contains 16 per cent. under ordinary circumstances. In summer these proportions are reduced, but they are remarkably increased in moist weather. Thus, the quantity of flour which, by weight, at the rate of 5 per cent. of water, would produce 150 lbs. of bread, will produce but 127½ lbs., when the same weight of flour is purchased in long continued wet weather. The prices of flour should, consequently, in all seasons, be based on the quantity of dry matter it contains, and which a simple and rapidly performed experiment would exactly indicate. Thus, by placing 100 grains of flour on a plate, and heating them on a vessel of boiling water for one hour, the loss sustained will denote the precise quantity of water mixed with the flour.—[Universal Corn Reporter.]

Apparatus contrived by Dr. Hare for separating Carbonic Oxide from Carbonic Acid, by means of Lime Water. [From the Mechanics' Magazine.]

Lime water being introduced in sufficient quantity into the inverted bell glass, another smaller bell glass, C, is supported within it, as represented in this figure. Both of the bells have perforated necks. The inverted bell is furnished with a brass cap, having a stuffing-box attached to it, through which the tube D, of copper, slides air-tight. About the lower end of this tube, the neck of the gum elastic bag is tied. The neck of the other bell is furnished with a cap and cock, surmounted by a gallows screw, by means of which a lead pipe, P P, with brass knob at the end suitably perforated, may be fastened to it, or removed at any moment. Suppose this pipe, by aid of another brass knob at the other extremity, to be attached to the perforated neck of a very tall bell glass filled with water upon a shelf of the pneumatic cistern, on opening a communication between the bells, the water will subside in the tall bell glass, over the cistern, and the air of the bell glass, C, being drawn into it, the lime water will rise into and occupy the whole of the space within the latter. As soon as this is effected, the cocks must be closed, and the tall bell glass replaced by a small one filled with water, and furnished with a gallows screw and cock. This bell being attached to the knob of the lead pipe, to which the tall bell had been fastened before, the apparatus is ready for use. I have employed it in the new process

for obtaining carbonic oxide from oxalic acid, by distillation with sulphuric acid in a glass retort. The gaseous product consists of equal volumes of carbonic oxide and carbonic acid, which being received in a bell glass, communicating as above described by a pipe with the bell glass C, may be transferred into the latter, through the pipe, by opening the cocks. As the gaseous mixture enters the bell C, the lime water subsides. As soon as a sufficient quantity of the gas has entered, the gaseous mixture may, by means of the gum elastic bag and the hand, be subjected to repeated jets of lime water, and thus depurated of all the carbonic acid. By raising the water in the outer bell, A, the purified carbonic oxide may be propelled, through the cock and lead pipe, into any vessel to which it may be desirable to have it transferred.

GALWAY.—The population is, we believe, above 40,000; of these a lamentable number is in a state of pauperism. The annals of Galway are carefully preserved from the year 1280, and afford most interesting details. It was once a great depot for Spanish wines.

The Galway females of the peasant class are fond of red petticoats and flannel or frieze jackets. The Wexford ones of blue striped linsey. But there is another much more distinguishing and important mark between them. In Galway, the Irish language is in very general use; so much so that, in many districts, English is hardly understood. In Wexford, Irish is totally unknown.—[Quarterly Journal.]

Animal Mechanics, or Proofs of Design in the Animal Frame. Continued from page 72. [From the Library of Useful Knowledge.]

Fig. 5.

By all this, we see, that if the skull is to be considered as an arch, and the parietal bones as forming that arch, they must be secured at the temporal and sphenoid* bones, the points from which they spring. And, in point of fact, where is it that the skull yields when a man falls, so as to strike the top of his head upon the ground?—in the temples. And yet the joinings are so secure, that the extremity of the bone does not start from its connections. It must be fractured before it is spurred out, and in that case only does the upper part of the arch yield.

But the best illustration of the form of the head is the dome.

A dome is a vault rising from a circular or elliptical base; and the human skull is, in fact, an elliptical surmounted dome, which latter term means that the dome is higher than the radius of its base. Taking this matter historically, we should presume that the dome was the most difficult piece of architecture, since the first dome erected appears to have been at Rome, in the reign of Augustus—the Pantheon—which is still entire. The dome of St. Sophia, in Constantinople, built in the time of the emperor Justinian, fell three times during its erection; and the dome of the cathedral of Florence stood unfinished 120 years for want of an architect. Yet we may, in one sense, say that every builder who tried it, as well as every laborer employed, had the most perfect model in his own head. It is obvious enough, that the weight of the upper part of the dome must disengage the stones from each other which form the lower circle, and tend to break up their joinings, and consequently to press or thrust outwards the circular wall on which it rests. No walls can support the weight, or rather, the lateral thrust, unless each stone of the dome be soldered to another, or the whole hooped together and girded. The dome of St. Paul's has a very strong double iron chain, linked together, at the bottom of the cone; and several other lesser chains between that and the cupola, which may be seen in the section of St. Paul's engraved by Hooker.

* In the Greek, *sphenoid*—in the Latin, *cuneiform*—like a wedge, because it is wedged among the other bones of the head; but these processes, called wedges, are more like dovetails, which enter into the irregularities of the bones, and hold them locked.

The bones of the head are securely bound together, so that the anatomist finds, when every thing is gone, save the bone itself, and there is neither muscle, ligament, nor membrane of any kind to connect the bones, they are still securely joined, and it requires his art to burst them asunder; and for this purpose he must employ a force which shall produce a uniform pressure from the centre outwards; and all the sutures must receive the pressure at one time, and equally, or they will not give way. And now is the time to observe another circumstance, which calls for our admiration. So little of accident is there in the joining of the bones, that the edge of a bone at the suture lies over the adjoining bones at one part, and under it at another, which, with the dovetailing of the suture, as before described, holds each bone in its place firmly attached; and it is this which gives security to the dome of the cranium.

If we look at the skull in front, we may consider the orbits of the eye as crypts under the greater building. And these under arches are groined, that is to say, there are strong arched spines of bone, which give strength sufficient to permit the interstices of the groinings, if I may so term them, to be very thin. Betwixt the eye and the brain, the bone is as thin as parchment; but if the anterior part of the skull had to rest on this, the foundation would be insufficient. This is the purpose of the strong ridge of bone which runs up like a buttress from the temple to the lateral part of the frontal bone, whilst the arch forming the upper part of the orbit is very strong; and these ridges of bone, when the skull is formed with what we call a due regard to security, give an extension to the forehead.*

In concluding this survey of the architecture of the head, let us suppose it so expanded that we could look upon it from within. In looking up to the vault we should at once perceive the application of the *groin* in masonry; for the groin is that projection in the vault which results from the intersection of two arches running in different directions. One rib or groin extends from the centre of the frontal bone to the most projecting part of the occipital foramen, or opening on the back of the head; the other rib crosses it from side to side of the occipital bone. The point of intersection of these two groins is the thickest and strongest part of the skull, and it is the most exposed, since it is the part of the head which would strike upon the ground when a man falls backwards.

What is termed the base of the skull is strengthened, if we may so express it, on the same principle: it is like a cylinder groin, where the rib of an arch does not terminate upon a buttress or pilaster, but is continued round in the completion of the circle. The base of the skull is irregular, and in many places thin and weak, but these arched spines or ribs give it strength to bear those shocks to which it is of course liable at the joining of the skull with the spine.

CHAPTER II.

MECHANISM OF THE SPINE.—The brain case is thus a perfect whole, secure on all sides, and strengthened where the exposure to injury is the greatest. We shall see, in the column which sustains it, equal provi-

sion for the security of the brain; and what is most admirable, there is an entirely different principle introduced here; for whereas, in the head, the whole aim is firmness in the joinings of the bones, in the spine which supports the head the object to be attained is mobility or pliancy. In the head, each bone is firmly secured to another; in the spine, the bones are not permitted to touch; there is interposed a soft and elastic material, which takes off the jar that would result from the contact of the bones. We shall consider this subject a little more in detail.

The spinal column, as it is called, serves three purposes: it is the great bond of union betwixt all the parts of the skeleton; it forms a tube for the lodgment of the spinal marrow, a part of the nervous system as important to life as the brain itself; and lastly, it is a column to sustain the head.

We now see the importance of the spine, and we shall next explain how the various offices are provided for.

If the protection of the spinal marrow had been the only object of this structure, it is natural to infer that it would have been a strong and unyielding tube of bone; but as it must yield to the inflexions of the body, it cannot be constituted in so strict an analogy with the skull. It must, therefore, bend; but it must have no abrupt or considerable bending at one part, for the spinal marrow within would in this way suffer.

By this consideration we perceive why there are twenty-four bones in the spine, each bending a little; each articulated or making a joint with its fellow; all yielding in a slight degree, and, consequently, permitting in the whole spine that flexibility necessary to the motions of the body. It is next to be observed, that whilst the spine by this provision moves in every direction, it gains a property which it belongs more to our present purpose to understand. The bones of the spine are called *vertebræ*; at each interstice between these bones, there is a peculiar grisly substance, which is squeezed out from betwixt the bones, and, therefore, permits them to approach and play a little in the motions of the body. This grisly substance is inclosed in an elastic binding, or membrane of great strength, which passes from the edge or border of one vertebra to the border of the one next it. When a weight is upon the body, the soft gristle is pressed out, and the membrane yields: the moment the weight is removed, the membranes recoil by their elasticity, the gristle is pressed into its place, and the bones resume their position.

We can readily understand how great the influence of these twenty-four joinings must be in giving elasticity to the whole column; and how much this must tend to the protection of the brain. Were it not for this interposition of elastic material, every motion of the body would produce a jar to the delicate texture of the brain, and we should suffer almost as much in alighting on our feet as in falling on our head. It is, as we have already remarked, necessary to interpose thin plates of lead or slate between the different pieces of a column, to prevent the edges (technically called *arrises*) of the cylinders from coming in contact, as they would in that case chip or split off.

But there is another very curious provision for the protection of the brain: we mean the curved form of the spine. If a steel spring, perfectly straight, be pressed

betwixt the hands from its extremities, it will resist, notwithstanding its elasticity, and when it does give way, it will be with a jerk.

Such would be the effect on the spine if it stood upright, one bone perpendicular to another; for then the weight would bear equally; the spine would yield neither to one side nor to the other, and consequently there would be a resistance from the pressure on all sides being balanced. We, therefore, see the great advantage resulting from the human spine being in the form of an italic *f*. It is prepared to yield in the direction of its curves; the pressure is of necessity more upon one side of the column than on the other; and its elasticity is immediately in operation without a jerk. It yields, recoils, and so forms the most perfect spring; admirably calculated to carry the head without jar or injury of any kind.

The most unhappy illustration of all this is the condition of old age. The tables of the skull are then consolidated, and the spine is rigid: if an old man should fall with his head upon the carpet, the blow, which would be of no consequence to the elastic frame of a child, may to him prove fatal; and the rigidity of the spine makes every step which he takes vibrate to the interior of the head, and jar on the brain.

We have hinted at a comparison betwixt the attachment of the spine to the pelvis and the insertion of the mast of a ship into the hull. The mast goes directly through the decks without touching them, and the heel of the mast goes into the step, which is formed of large solid pieces of oak timber laid across the keelson. The keelson is an inner keel, resting upon the floor-timbers of the ship, and directly over the proper keel. These are contrivances for enlarging the base on which the mast rests as a column: for as, in proportion to the height and width of a column, its base must be enlarged, or it would sink into the earth, so, if the mast were to bear upon a point, it would break through the bottom of the ship.

The mast is supported upright by the shrouds and stays. The shrouds secure it against the lateral or rolling motion, and the stays and backstays against the pitching of the ship. These form what is termed the standing rigging. The mast does not bear upon the deck or on the beams of the ship; indeed, there is a space covered with canvas betwixt the deck and the mast.

We often hear of a new ship going to sea to stretch her rigging; that is, to permit the shrouds and stays to be stretched by the motion of the ship, after which they are again braced tight; for if she were overtaken by a storm before this operation, and when the stays and shrouds were relaxed, the mast would lean against the upper deck, by which it would be sprung or carried away. Indeed, the greater proportion of masts that are lost are lost in this manner. There are no boats which keep the sea in such storms as those which navigate the Gulf of Finland. Their masts are not attached at all to the hull of the ship, but simply rest upon the step.

Although the spine has not a strict resemblance to the mast, the contrivances of the ship-builder, however different from the provisions of nature, show what object is to be attained; and when we are thus made aware of what is necessary to the security of a column on a moveable base, we are prepared to appreciate the superior provisions

* Although they are solid arches connected with the building of the cranium, and bear no relation to the surfaces of the brain, the early craniologists would have persuaded us that their forms correspond with the surfaces of the brain, and indicate particular capacities or talents.

of nature for giving security to the human spine.

AGRICULTURE, &c.

A NEW MODE OF REARING ASPARAGUS.—

The asparagus seed should be sown from the middle of March to the last of April, in a rich spot, (not too much exposed to the mid-day sun,) one inch deep, and the seed one inch apart; after they come up, to be kept clear of grass and weeds during the summer, by hand weeding; to be dug up the next fall or spring—(I prefer the spring, as the roots do not grow during the winter, if set out in the fall, and are liable to be killed by a severe winter,) and set in beds prepared as follows: Dig out the size of the beds nine inches deep—cover the bottom three inches deep with rich marl, (which has been my practice,) though I believe that oyster shells half burned will be as good, as it is intended as a lasting heating manure, to protect the roots in winter, and force the vegetable early in the spring: then put three inches deep of coarse stable manure, then three inches of rich earth. This brings the beds on a level with the surface of the earth. Next lay off the beds in rows eighteen by twelve inches apart, and put a single eye or spire in each spot where the lines intersect, and cover them three inches deep with rich earth. Plank the sides of the beds, as this prevents grass and other roots from running into the beds, and also keeps the outside roots from being exposed, by the sides of the beds washing away. The beds should be kept clean by hand weeding, and all the earth and manure used in making them should be perfectly free from grass roots and noxious weeds. In the fall of the year, after the seeds have matured, cut the tops off close to the beds, (being careful that not a single seed is left to vegetate on the beds,) as they have already as many roots as the space they occupy should contain, and if additional roots are suffered to form from year to year from the falling of the seed every fall, the beds will soon be so much clustered with roots that the vegetable must degenerate, at least in size and length, as the new roots form near, or on the surface. Some prevent this by burning, but I think the best way is to pick them off by hand, before the ball that contains the seed breaks. You then top dress the beds with coarse stable manure, let it lie on all winter, and in the following spring rake off the coarsest part, and fork in the remainder, being careful that the fork does not touch the roots. Pursue this course two falls, and early in the third spring, before the beds are forked up, put on two inches of light well rotted manure—fork it with the stable manure, then put on from three to four inches deep of clean sand from the river shore, and you will cut in the month of April the best vegetable we have in Virginia. I would not give my beds for the balance of my garden. I think there is much in the kind of seed. I obtain my seed from New-York; they were marked "giant asparagus."

The cover of sand is important on several accounts; its being a great absorber of heat and moisture, so soon as the vegetable gets through the soil, it is hastily thrown through the sand to the surface in a bleached tender state, and the cutting from day to day is more uniformly of the same tender delicious vegetable. The sand also prevents grass from growing on the beds, which obviates the necessity of so much hand weeding during the season for cutting, by which the beds frequently become trampled, and the vegetable that is about to come through the surface mashed down, which not only destroys the spires that are so trampled on by the gardener in the process of hand weeding, but (I think) injures the root. The sand should be laid in the alleys between the beds, in the fall, when the beds are about to receive the top dressing of stable litter to keep them warm through the winter; and in the sand is about to be replaced in the

spring, it should be passed through a sieve of such size as will not let the balls (that contain the seed) pass through. This will be another means of preventing the seed from vegetating on the beds. There is a practice very prevalent with gardeners, to plant lettuce, radishes, and other early vegetables on the beds; this should never be done, and particularly with radishes, as they have a long root that extends to the roots of the asparagus, and must seriously interfere with them.

I frequently cut asparagus from three to five and a half, and once I cut a spire six inches in circumference, and from five to eight inches long; it could have been cut longer, but it is never tender near the root.—[Farmer's Reg.]

MANURING IN DRILLS.—A friend of mine, who I hope is now better employed, who was a man of general science and a practical and scientific farmer, exerted himself for thirty years to improve a poor sandy farm—by the method of manuring which I am about to mention; he effected more for it in the five years which preceded his death, than had been accomplished in the other five and twenty. From the shore of a saltwater sound to which the farm was contiguous, he littered his farm with sea ware. In the fall, he laid off with a plough the field which he intended for the next year's crop of corn, in trenches seven feet apart, twelve inches in width and six in depth. The plough traversed the same furrow until the trench was sufficiently wide and deep—its sides were made by the bar of the plough. Those trenches were then filled with sea ware from the farm yard, and stable manure; the latter placed in the bottom of the trench, and making from a tenth to a sixteenth part of the combination: the trenches were then covered with the plough, and upon the ridges thus formed, the crop of corn was drilled the succeeding spring. After the laying by of the corn crop, the field had a year of rest, after which the intervals between the corn rows were treated and used as the rows had been. The advantages of that manner of manuring are manifest. Almost all the fertilizing properties of the manure which escaped whilst becoming decomposed, fed the crop—the bed of the manure was not broken open, nor was it exposed to evaporation, until the soil had become "seized in its demesne as of fee" of all its treasures, save those which had already produced food for man and beast. A few manurings in that way will make a very poor field of any susceptibility rich.—[American Farmer.]

FERMENTED MANURE.—A writer in the Northern Farmer gives the following indirect proof against his own theory, by stating what old experienced farmers believe. Says he,—

"Strange as it may seem, many old farmers yet believe that old rotted manure promotes vegetation better than fresh, or unfermented manure! They appear to be ignorant of the fact, that the longer manure remains exposed to rot, the less nutriment or food for plants it retains; and the more it becomes assimilated to mere earth."

SAVING PEAS AND BEANS FROM MICE.—Chop up the tops of last year's shoots of furze, and sow them in the drill.—[Gardener's and Forester's Record, No. 3.]

CLEANLINESS OF THE DUTCH.—As to cleanliness, every dwelling-house is a model and a pattern; they seem to vie with each other on this point. The cowhouse is pure and clean, not a particle of filth being to be seen in it; the cows are as clean as if they were in a dining room; the milk and cheese houses, and in short every part of the house, are free from dust and dirt of any kind; the manure is placed at a convenient distance from the cowhouse, behind the house, and every particle is carefully collected together. The whole apartments, even the byre and

hay-house, are generally under one roof; and the cleanly system, and the admirable arrangement, give that comfort and pleasure which are too often wanting in this country.

MANAGEMENT OF CALVES IN HOLLAND.—

From the fact that Hollanders are distinguished for their dairy husbandry, their management of calves is deserving of attention. We find the following in the Transactions of the Highland Society of Scotland:

The most approved method of treating the calf is as follows: It is immediately after its birth taken from the cow, put in a separate place, and laid on dry straw. A little salt is given, and the tongue and mouth rubbed with it. It is also rubbed clean with straw. After the lapse of six or eight hours, the first beesting of the mother cow, diluted with one-third water, is given to the calf to drink, and this treatment is continued for some days, the liquid being given thrice a-day. Thereafter, during two or three weeks, they give the calf the milk as it comes from the cow, diluted with one-fourth water, in which now and then a small handful of sand is put; then churn-milk is gradually given, and it is supplied with hay; at the age of ten weeks it is brought out to the meadow, where it is also supplied with skimmed milk, churned milk, or whey. In this way each farmer raises the proper number of quey calves to fill up vacancies; but calves fattened for sale have milk from the cow three times a day.

For some days after calving the cow is milked thrice a day, and they then return to the usual practice of milking twice a-day.

BLACK TONGUE.—We scarcely open a newspaper from the country, without meeting a paragraph or a communication respecting a disease in horses and cattle called the *Black Tongue* or the *Burnt Tongue*. It is said to prevail chiefly among horses, but is not uncommon among cattle. Some respectable physicians have given their opinion, that if any person who was taking care of animals afflicted with this distemper, should get any of the matter of the diseased tongue into an eye or a flesh wound, it would be a very serious affair, and might prove fatal. We have heard that several persons in the country are now suffering under an inflammation from this cause.—[Boston Courier.]

BURNED TONGUE.—This disease, which we mentioned in our last, and for which we gave recipes, has become very prevalent in this and some other sections of the State. It is undoubtedly an epidemic, as it attacks those which have not been near or exposed to those suffering with it. Hogs, horses, and cows, all have it.

At first, it appears like a blister upon the tongue, or in black patches upon the lips. The animals appear sluggish, drool, and eat hay with difficulty: sometimes, they refuse all nourishment, and seem averse to drinking. Water, whether cold or warm, when drank, brings on an ague fit, and they tremble and shiver exceedingly. Some of the horses have been attacked in the feet. A swelling and eruption commences at the top of the hoof, accompanied with evident pain and soreness.

We have treated one case of this kind successfully by washing the feet with warm soap suds—then by a weak solution of chloride of lime, and a bandage soaked in pigs' foot oil. A very weak solution of oil of vitriol, used as a wash, has been successful in those cases where it has been tried. Physic of some nature should be freely used.—[Maine Farmer.]

POKE BERRIES.—Dr. R. R. Harden states, in the Southern Planter, that he has found these berries to be a certain cure of epilepsy.

NEW-YORK AMERICAN.

FEBRUARY 23—MARCH 1, 1834.

LITERARY NOTICES.

No. XVI.

Prairie Ronde, (Kalamazoo co. M. T.) Dec. 26.

"Stranger will you take a cocktail with us," called out a tall athletic looking fellow to me as I was making my way through a groupe of wild looking characters assembled an hour since around the fire by which I am now writing. There was a long haired "hoosher" from Indiana, a couple of smart looking "suckers" from the southern part of Illinois, a keen-eyed leather-belted "badger" from the mines of Ouisconsin, and a sturdy yeomanlike fellow, whose white capote, Indian mockasons and red sash proclaimed, while he boasted a three years residence, the genuine *wolverine*, or naturalized Michigianian. Could one refuse to drink with such a company? The spokesman was evidently a "red-horse" from Kentucky, and nothing was wanting but a "buck-eye" from Ohio, to render the assemblage as complete as it was select. I was in the midst of the first real prairie I had ever seen—on an island of timber, whose lee while making slow headway for the last two hours, with a biting breeze on my beam, it had been my whole object aim and ambition to get—a comfortable bar room, a smoking "cocktail"—a worshipful assemblage (Goldsmith's Club was a fool to it) had never entered my dreams! Could I refuse to drink with such a company? The warm glass is in my frozen fingers. The most devout temperance man could see no harm in that! It is touched smartly by the rim of the Red-horse. It is brushed by the Hoosher. It rings against the Badger—comes in companionable contact with the Wolverine, "my respects to you gentlemen and luck to all of us."

Here was a capital commencement with just the sort of sallad of society, I have been long wishing to meet with, having as yet only tasted its component parts in detail. But auspicious as was the beginning, I nearly got into a difficulty with my new acquaintances a few moments afterward, by handing the landlord a share of the reckoning, and I took back the coin forced upon me, with many apologies upon my part for having presumed to pay part of a "general treat," while laboring under the disqualifications of being a stranger. Room was then courteously made for me by the fire-place, and accepting a pipe, proffered by one of the company, a few whiffs made me sufficiently sick and at home to lay it by without further ceremony. "There's a smart chance of cigars there in the bar, stranger, if you'd try some of them," said one of the hoshers, "yes," echoed the other "and they are a heap better than those pipes." "I allow" rejoined another of the company "but I wish that fellow would shut the door; he must think we were all raised in a saw-mill, and then he looks so peert whenever he comes." "Poor fellow," ejaculated one who had not yet spoken, "he is considerably troubled with youngness."

"From the eastern side, stranger," said another to me, "I'm told it's tolerable frog pasture. Now here the soil's so deep one can't raise any long sarce—they all get pulled through the other side. We can winter our cows, however, on wooden clocks, there's so many Yankees among us," &c. &c.

A scattering conversation was kept up in similar quaint expressions for sometime, but as Mr. Hackett has already given the cream of western phraseology in his highly original part of "the Kentuckian," I will not tire you with enumerating more of those which fell under my observation. These unique terms, indeed, were poured out so copiously, that it was impossible for one's memory, though elastic as a pair of saddle bags, to retain them. At last a *train* and a couple of carioles drove up to the door, and I discovered, upon their bundling merrily into these vehicles, that the whole company were

bound for a wedding. "Jim," cried one driver to another, snapping his whip, "let our horses run near the silk." Jim cracked his snapper, and the light carioles taking the lead, the more humble train skimmed rapidly after them: their dark shadows were soon lost upon the moonlit prairie, and the sound of their bells died away in the distance by the time I had regained my now solitary seat by the fire.

I have had but a sorry time since leaving the agreeable company, I spoke of in my last. To day indeed the weather though cold and windy has been clear. But on the two previous, I rode for the whole time through alternate snow and sleet which the wind at times blew so directly in my face as to make it almost impossible to proceed. In one instance while making my way through a dense forest of 12 or 14 miles between the openings without a cabin by the way, my horse stopped suddenly and looking about ten paces ahead, I saw a couple of deer standing immediately in my path and gazing on me with the most perfect unconcern—but my fingers were so numb with cold that I was unable to cock my gun while the timid creatures slowly retired within the depths of the forest. The Kalamazoo wound through this wood, but the under growth of timber was so very heavy that its waters though within a few yards of me were rarely discernible—and their ample flow when seen, as now swollen by the troubled current of Battle Creek and other tributaries, though capable of bearing boats of considerable burthen, possessed less charms for me than when I first struck the slender rill as it leaped unsullied from its virgin fountain, and went singing on its course. Still it was with regret, when at last ferried over the Kalamazoo, so long my only companion, that, on turning my horse's head to the south, I took leave of its Arcadian banks for ever. I passed the previous night at the little hamlet of Comstock, where an enterprising young gentleman, after whom the place is called, having the advantage of a good country, is creating a flourishing establishment around him; a frame store and several log cabins, with two or three mills, already giving some importance to the site in a new country. My ride of to-day, having started late, brought me about sunset a distance of 20 miles to the verge of Prairie Ronde; the intermediate country consisting partly of burr, oak plains, broken sometimes by the short round hills I have before described to you, and partly of broad grassy meadows running sometimes into marshes and again watered by some clear stream whose sandy bottom would contrast strongly with its low sedgy brink.—The ground became higher and firmer as I approached Prairie Ronde and then after riding for a few miles through the openings, when I expected to descend upon a broad meadow somewhat resembling the many I have seen in Michigan fully answering to my pre-conceived ideas of a Prairie, I came suddenly upon an immense piece of cleared table land some 50 feet above a pretty Lake in its vicinity. The scattering houses around its borders with the island of timber in the centre, and the range of six or seven miles of prairie on every side (assured me that this was Prairie Ronde, while the piercing blast which as the sun sunk redly on the opposite side, rushed out from his western resting place and blew the snow drift in my teeth, made me eager to cross the waste as rapidly as possible and sufficiently accounts for the pleasure with which I entered this hospitable tavern. The collection of houses which stand sheltered by this wood, is called "Schoolcraft." The wood itself, though only 5 or 600 acres in extent, has a small lake in the centre, and the village, if not the whole settled part of the Prairie, is distinguished by the number of fine running horses, blood dogs and keen sportsmen, it has, in proportion to the population. Fox hunting, on horseback, with full packs of hounds, is the favorite sport though wolf, bear, and badger baiting have each their active followers. The soil is so easy of

culture and so generous in its product, that the settlers after attending to their necessary avocations have ample leisure for their many recreations. Prairie Ronde though like all parts of Michigan in a great measure settled by emigrants from the state of New York, is said to count a still greater number of its residents from nations of the south and west. The population generally was perhaps fairly represented at the assembly to which I so unceremoniously introduced you at the opening of the letter.

Niles, (Berrien Co., M. T.) Dec. 23.

I have been now for two days in the St. Josephs county, considered among the finest in Michigan, having, since I wrote the above, traversed the counties of St. Joseph and Cass, watered by the St. Joseph's river, which is the most imposing-looking stream I have yet seen. A ride of 14 miles from Prairie Ronde brought me first to its banks, which, rising occasionally 40 or 50 feet above the water, in a sudden bluff, look higher than those of any river I have yet described to you. You must already have gathered from my attempts at portraying Michigan scenery, that neither the grand, the picturesque—hardly even the romantic—are to be numbered among its characteristics. "The beautiful" comprehends them all: and yet you can readily imagine, that that beauty is neither tame nor monotonous, which can shine through the dreary months of winter, and make the half frozen and solitary traveller almost forget its rigors. It is true that one brought up in a more rugged and broken country might often miss the mountain tops leaning against the sky,—might sigh for the sound of a cascade, and long once more to plant his foot upon a cliff; and yet, where would the eye more delight to wander, than through these beautiful groves, which in summer must stretch their green arcades on every side? Where rest more happily, than on those grassy meadows on which their vistas open? These streams, too, that sparkle so over their golden beds, are they not substitutes for the rushing torrents of more mountainous countries? or does the lichen-covered crag tempt one's footsteps more than this teeming soil, when nature has carpeted it with the myriad of wild flowers which the summer's scene calls forth? To no scenery of our country that I have yet seen, is the term 'Arcadian' more applicable than to the rich and fairy landscape on the western side of the Peninsula watered by the Kalamazoo and the St. Josephs.

The latter stream, when I first beheld it, was filled with floating ice, which the deep and rapid tide brought down with such force, that my horse recoiled with affright, when I attempted to urge him into the current, at a point where an old woman told me was the usual place of fording. A rope ferry a quarter of a mile further on, removed the difficulty, and finding my way along a rich bottom where the trail was so encumbered with vines that it was difficult, even at this season, to keep it, I hailed a grim-looking Charron, with a shock head of hair, attired in a green hunting-shirt, who was standing in the door-way of a cabin on the opposite side, and crossing for me in his scow, I was soon conveyed with my Bucephalus across the wintry torrent. The country now became gradually more populous as I approached the village and prairie of White Pigeon. I had travelled 14 miles in the morning without seeing the sign of a habitation; and as one meets with neither travellers nor emigrants at this season, there is some company, even in the smoke of a chimney, though you do not stop to warm your fingers by the fire beneath it. I expected long before this to have fallen in with a most agreeable companion in a gentleman of the country, whom I met with at Detroit, and who is a considerable proprietor on the St. Josephs. Having a fine taste for natural scenery, and being one of the best rifle shots of whom I have ever heard, I anticipated

much pleasure and advantage from his company and guidance through the nearer sections of the Peninsula. But my journey through Michigan is now nearly finished, as it began, entirely alone. At White Pigeon, where I found quite a pretty village of four years growth, I seemed, in getting upon the stage route from Detroit to Chicago, to get back once more to an old country. I found a good tavern and attendance at Savary's, and discovered, by the travellers going north and south, that travelling was not as yet completely frozen up. There are a great many English emigrants settled upon this prairie, who, I am told, are successfully introducing here the use of hedges instead of fences, in farming. They are generally of a respectable class, and seem to be quite popular with the American settlers.

The morning was fine when I left White Pigeon to-day; and as the sun shot down through the tall woods, nothing could be more cheering than my ride among the beautiful hills of Cass county. The road, which is remarkably good, meanders through ravines for a distance of many miles, the conical hills resting upon the plain in such a manner as barely to leave a wheel track between them, except when at times some pretty lake or broad meadow pushes its friths far within their embrace. A prairie of some extent was to be traversed on this side of these eminences, and the floating ice on the St. Joseph's was glistening beneath its shadowy banks in the rays of the cold winter morn when I reached its borders, and arrived at Mr. Olds' tavern in this flourishing town of Niles. Myne host, who does not seem to be the most accommodating person in the world, has refused to provide supper for myself and two other gentlemen at so late an hour, assigning, as a reason, that "his women are not made of steel"—an instance of cause and effect which I merely put upon record as being the only one of the kind I have met with in all Michigan; and it is somewhat remarkable after the ready accommodation which, during all my rambles, I have met with, at all hours, from the cabin of the humblest settler, to find that money cannot command a meal at an established stage-house. It was impossible, however, to give myne host one's real opinion of his fitness to keep a tavern, when several gentlemen of the place present, very politely seemed to take the circumstance much more to heart than do they who are as much amused as vexed at the incident. My fellow sufferers appear to be both agreeable men, and as we are to travel in company to Chicago, &c. the sympathy arising from our present melancholy condition may insure a pleasant intercourse under happier auspices.

The county of Cass, through which I have passed to-day, has a population of more than 2000, and contains 7 prairies of 6 or 8 miles in diameter, besides many smaller ones. They produce, when cultivated, from 30 to 80 bushels of new corn, or 40 of wheat, to the acre. The mode of planting the former is to run a furrow, drop the corn in, and cover it with a succeeding furrow, which is planted in a similar way, and the field is rarely either ploughed or hoed after planting. There are several pretty lakes in this county; but it is not so well watered as St. Joseph's, through which I passed yesterday, which for local advantages of every kind, as well as fertility of soil, is generally considered one of the best in the Peninsula. I like Kalamazoo county, however, as much as any part of Michigan I have seen. I am now within 8 or 10 miles of the Indiana boundary, and some twenty or thirty only from the shores of Lake Michigan, having described nearly a semi-circle in my tour through the Peninsula, including, with some deviations, the counties of Wayne, Monroe, Lenawee, and Washtenaw, on the east, Jackson in the centre, and Calhoun, Kalamazoo, St. Joseph's, Cass and Berrien, on the west; and I have not met a resident in that whole range but what was pleased with the country,

and I may almost say attached to its soil. The females indeed will sometimes murmur, and in some remote places I have heard those whose conversations indicated that they had not been brought up with the most ordinary advantages, complain of "the want of society!" But even these would love to dilate upon the beauties of the country when the flowers were in bloom. Others again who would prove an ornament to any circle, would sigh at one moment for the comforts and elegancies of their maternal homes, while their eyes would kindle with enthusiasm the next, when speaking of the appearance which the woods around their new dwellings wore in summer. Small communities form but slowly in a country where the settlers, instead of gradually pushing their way together into the depths of the forest, as at the Eastward, drive their wagons in any direction a hundred miles through the openings, and plant themselves down a day's journey apart, just where their fancy prompts them. This will account for my so often lighting upon a pleasant hamlet after a day's travel through a perfect wilderness. The river St. Joseph's debouches into lake Michigan in this county; and as a steamboat will probably run the next season from the town rapidly growing at its mouth, to Chicago, a Railroad from Detroit to this steamboat harbor, is only wanting to bring the visiter of Niagara within a few days' travel of Chicago, and carry him through the flowery groves of Michigan to one of the most important points in the Union, and what may be termed the central head of the Mississippi Valley. Delmonico may then stock his larder with grouse from the meadows of Michigan, and Gassin try his skill upon the delicious fish that swarm her lakes and rivers (would that I could at this moment witness some of their curious orgies) while sportsmen will think no more of a trip hither than they do now of an excursion to Islip, Rayner South, or Patchogue. In the mean time I have secured you the seeds of more than 20 varieties of wild flowers, which I shall send to their destination as soon as possible, lest from the rapid increase of internal communication they shall lose half their value from ceasing to be a variety.

HISTORY OF THE RISE AND PROGRESS OF THE ARTS OF DESIGN IN THE UNITED STATES. By WILLIAM DUNLAP.—This, though a work in *posse* and not yet in *esse*—is one towards which we have for some time desired an opportunity of calling the attention of our readers—and asking their encouragement by subscription to it.

Mr. Dunlap's name as an agreeable writer, is familiar to the country. His latest work, the *History of the American Theatre*, met with great and deserved success—and we cannot but anticipate an equal degree of success, for that now under his hands, artist as he is, as well as author—and of which we can furnish no better or more attractive notice than that set forth by himself in his proposals for its publication by subscription.

To trace the progress of Painting, Sculpture, Engraving, and Architecture, in our country, and bring before the Public a connected series of facts, respecting the lives and fortunes of those individuals, whether native or foreign, who have exercised any of these arts in the United States, appears to be an undertaking, which, if executed with moderate abilities, and a strict regard to truth, will form a portion of American History both entertaining and instructive.

The materials collected by the author of this work, will be chronologically arranged, from the early days of our existence as colonies to the present time. To rescue from oblivion or misrepresentation the names of our earliest Artists, and to record the effects produced by the visits of foreign Professors to our shores, appear to be subjects of sufficient interest to command the attention of our citizens generally;—to the great body of Artists now exerting their talents in the Republic, it is a species of knowledge that seems indispensable.

The most ample Biographies of all known Artists, native or foreign, who have exercised their professions in this country, will be given. And when we recur to the names of those who, with West, Copley, and Stuart, have passed away, and to the brilliant constellation which now adorns the United States, it will be seen that the biographical portion of the work will be as extensive, and as much varied in character, as the most eager thirst for this species of knowledge or entertainment can desire.

The writer of this work has had personal knowledge of most of the Artists who will be the subjects of its pages, from West and Copley to the men of the present day. Information and assistance have been liberally furnished from the best sources. Those most conspicuous in our literature and arts, have most freely aided the author. This enables him confidently to promise such a collection of facts on the subjects of which he treats, as could not be submitted to the public from any other pen.

The worth of the work will principally consist in its authenticity. Opinions advanced may be valuable; historical accounts of pictures curious; personal narratives interesting; but facts shall be undeniable—and of such importance to the history of the country, that it would be incomplete without them; for it is presumed, that the history of those arts which civilize mankind, and embellish society, form an essential portion of the history of all nations.

We can add nothing to this simple outline, which could have the effect of enhancing such a work in the eye of the public. We, therefore, only say in conclusion, that the publication is already in a considerable state of forwardness—that it will be comprised in two 8vo. volumes of about 400 pages each, at the price of \$5 dollars—and that we shall very gladly receive at this office the names of any persons disposed to subscribe.

THE AMERICAN JOURNAL OF SCIENCE AND ART, January, 1834; by BENJAMIN SILLIMAN, MD. LL.D. &c. New Haven, HAZEKIAH HOWE & Co.—We referred some weeks ago to the paper of this number which was not then published, that upon the whole will interest most persons—that on the meteoric phenomena of the 13th November last. We shall look with interest for the conclusion in a future number of this paper; though not with much expectation, we confess, of seeing any satisfactory explanation of this extraordinary phenomenon.

THE NEW ENGLAND MAGAZINE, for February: Boston, J. T. Buckingham.—A charming number—light, graceful, spiritual, and withal, sensible. We have hesitated between two or three short and clever articles—Connecticut as it was, the Eating Philosopher, &c. &c.; but have finally settled down—mainly because it was the shoiestest—on Nicolo Paganini:

The Devil came fiddlin' thro' our tuwa.—*Scotch Ballad.*

It is well known of John Bull that he spoils his favorites and then punishes them. He made an Orpheus of Paganini, and then reviled him because he was not born or bred a hero.

This great personage, who looks a good deal like Mephistopheles, gave a farewell concert at Drury Lane, in August last. Though the popular favor towards him had waned, yet the house was crowded. The prints give a pretty good representation of the solemn musician,

"Black he stood as night."

His graceless bow was that of an ill-jointed, paste-board man, and no smile played over the long wrinkles of his visage. He seemed to stand alone in the world—delighting thousands, but having sympathies with none. He is sharp and thin. "The case of a treble hautboy were a mansion for him. His appearance is spectral and impressive.

— "His look
Drew audience and attention still as night,
Or summer's moonlight air."

Music, however, is a forced plant in London—it is a luxury for which men pay largely, as for grapes, and pines; for they cannot raise it. It belongs to Germany and Italy,—to Ireland and Scotland; but not to England. Though Mr. Bull's ears are not over delicate, like Bottom, it pleases him to have them tickled. The strains of Rossini fell upon them with little power; but when the necromancer struck up—albeit, but on one string—"St. Patrick's day, in the morning," the whole assembly was in an ecstasy. The silence, however, was like that of the desert,—every one held his breath till the tune was finished,

and then came forth a burst of applause that would have roused any mortal sleeper. If it should please Paganini to visit us musical Hesperians, let him play many of the simple old tunes, such as delight "the knitters in the sun." He breathes into them a new soul.

Genoa has the glory of giving birth to Columbus and Paganini. A dream of his mother, like most omens, tended to verify itself. An angel appeared to her in a dream, and promised to make her son Nicolo a great player on the violin, who accordingly began upon a fiddle as large as himself, and he gave concerts at nine years of age.

His father believed as much in fortune as his mother in angels; for he was ever dabbling in lotteries. He received more profit from his son's concerts, who, at fifteen, was a travelling meteor, attracting the worship of the musical Italians. His father threatened to slaughter him, unless the profits were given up, and, for a while, Nicolo surrendered them, —about twenty thousand francs.

Soon Paganini had no rivals. Lafont, the Parisian, indeed, courted a trial, and came off shorn of his laurels.

"Strange that such difference should be,
Twixt twiddle dum and twiddle dee."

Success was followed, as in all things, by envy and slanders; and fictions of murders, of the drugged bowl, and the dagger, were believed of Paganini, on no stronger evidence than his physiognomy. A dungeon, it was said, was for years the seclusion, in which he acquired the magic of his art. All men agreed upon the dungeon: there was some difference of opinion as to the nature of his crime. Some ascribed to him the crimes of Salvatore Rosa, and affirmed that he had been a captain of banditti; others softened his offences to those of a simple Carbonare, or to having killed his antagonist in a duel. But the most romantic story was generally believed, that he had murdered his wife or his mistress. These reports, though they were of no advantage to his character, did no injury to his calling: men and women were the more anxious to see him, as they could at the same time be gratified with the hearing of music and the sight of a murderer. A bad name is of great use to a good performer of any kind, and the person that robs him of that often makes him poor in deed. At Vienna, however, Paganini denied the whole story of the incarceration with its adjuncts.

From a memoir we extract the following, which shows a name as widely spread as that of Charles XII. "Italy, from Mont Blanc to Vesuvius, from the heights of Abruzzi to the shores of the Adriatic, resounded with his praise. The strains of his wonderful working violin were borne on the waters of the Danube, till the ocean murmured 'Paganini!'"

THE UNITED STATES REVIEW, No. I. Philadelphia: A. WALDIE. New York: G. & C. & H. CARVILL.—Periodical literature would seem, of all others, best adapted to a busy, inquiring, but not ever studious people, like ourselves. It is of a nature to be taken up at any moment—to be relished at broken intervals—and, by its variety, to catch and fix the attention, even of minds habitually intent upon the varied pursuits of active life. Yet, so far as the matter is understood by the public, this sort of literature does not meet with the degree of encouragement that, a priori, might have been anticipated. The North American Review, the oldest of our Quarterlies, only now, after long years of existences and supported as it undoubtedly has been by much sustained talent, affords a reasonable remuneration to its conductors. The American Quarterly—younger in the field, though not less able—yields not yet any such return for the expense and labor connected with its publication, as to make it an object of any considerable value; and meanwhile, the Southern Review, got up in Charleston, and written with great general ability, but too deeply tinged with peculiar political views, and partly perhaps because of that tinge, after struggling through some two or three years of fitful existence, perished. In the face of circumstances, apparently so little encouraging, we have here the first number of a new Quarterly; and not one of those before mentioned presented itself, we are persuaded, in as prepossessing a shape as this one, in all that regards the mechanical execution of the work, paper typography, &c.—with or more general claim to consideration on the score of its litera-

ry contents.—There is not indeed, any brilliant paper in this number—no one marked by particular and eminent talent—but all the articles are well done—the doctrines inculcated, and the general tone of thinking is such, as liberal and educated men will approve—and the whole scope and spirit of the publication recommend it to public patronage.

The contents are—Art. I. On Anniversary Discourses—in the course of which exception is justly taken to such addresses as—intended for mixed audiences, and for the most part on kindly occasions—introduce debateable topics of politics or political economy—that of Mr. Maxcy, delivered before the Brown University of Providence, and that of Mr. Kennedy, delivered before the American Institute of this city, are cited as bad examples in this particular.—

Art. II. On the Use and Abuse of Political Terms. is quite interesting, and refers to a book which, from the exhibition therein made of it, we hope to see republished in this country; where, *par excellence*, the abuse in question prevails. Art. III. recalls in a kindly manner the poems and prose works of Richard H. Dana. Art. IV. On Anti-Colonial History, annihilates pretty much at one blow Meulton's History of New York, and Heckelwelder's flattering fictions about his favorite race of the Lenni Lennapes. Art. V. is on Mrs. Lee's Memoirs of Baron Cuvier. Art. VI. On Traits and Stories of Irish Peasantry, which are highly praised. Art. VII. On imprisonment for debt—adverse to the law abolishing that remedy.— Art. VIII. On Ancient Art in Egypt and India. Art. IX. On Lucy Aiken's Court of King Charles I.; and Art. X. On the Temperance Cause, which it sincerely but temperately advocates.

THE HEART, DELINEATED IN ITS STATE BY NATURE, AND AS RENewed BY GRACE, by a Presbyter of the Protestant Episcopal Church: 1 vol. New York, SWORDS, STANFORD, & Co.—A skilful moral anatomist has, in this little volume, laid bare the self-delusions of the human heart—its tendency to error and evil while unregenerate—and its consequent need of those proper religious influences, which can alone so regulate its emotions as to render them conducive to happiness here, and fit its possessor for a better world.

THE HEIRESS, a Novel; 2 vols. New York, HARPER & BROTHERS.—Novels have been scarce lately—new ones we mean—and therein consists the best chance for success of this we now announce; which, on other grounds, and amidst active competition, judged on its merits, would hardly run a brilliant career.

A NEW TRAGEDY is to be shortly brought out, as we hear at the Park, under the auspices of Miss Kemble and her father. It is from a native pen, and will not fail, we think—for we have had a peep at the M.S.—aided as it will be by the talents and skill of the Kembles, of brilliant success.

FOREIGN INTELLIGENCE.

FROM ENGLAND.—After Saturday's paper went to press, we received our London files by the New York to the 7th ult. We make from them such extracts as are of interest and we can find room for.

The leading topic is the state of uncertainty respecting the course which Russia may pursue, when apprized of the preparations making upon a large scale, both in England and in France, to have a large naval force in the Mediterranean.

The London Times—from which paper of 6th January, we give a long extract—is of striking a blow, or at any rate making the demonstration so real, that Russia shall not mistake its nature or purpose. The Spectator of 4th January thus comments on Russian affairs:

An article in a German newspaper, the *Allgemeine Zeitung*, on the state of Turkish affairs, and

the policy of Russia, appears to have effected a change all at once in the tone of our Government journals. Thus, on Monday, the *Globe* spoke of the "idle endeavor in some quarters to contrast the language of Louis Philip, in his late speech, with his actions, and to argue, from the improved condition of his army, as well as from the active equipment of ships in our dock-yards, that the intentions of the French and English Governments were not so pacific as their professions." The whole tenor of the *Globe's* remarks was to discourage the idea that Russia would "exasperate both the Great States of the West." But on Tuesday the German papers arrived; and in the article, evidently official, above referred to, it was intimated, that if the French and British fleet was reinforced, Russia would be compelled to arm some vessels. This threat immediately caused our Ministerial organ to assume a warlike tone; and on Wednesday we were reminded that it is the unquestionable intention of Russia to model Turkey into a species of tributary State, or a convenient vassal; that the Porte, under such protectorship, would be rendered subservient to designs hostile to France, England, and all other European states; that Russia has put off the payment of her last instalment of the Greek loan; that no one can be deceived by the smooth tone of the Austrian journal; and finally, that Russian ambition must be resisted "by friendly remonstrance, to rectify sinister intentions, and, if that proved unavailing, the adoption of the stronger alternative." Stronger alternative, of course, means war.

The *Times* spoke out, as usual, with more decision of tone. The necessity of prompt and vigorous measures is insisted upon; "negotiations, despatches, and Lord Ponsonby, and the rest of it," are laughed at; a few broadsides are recommended, as the right kind of protocols to bring Russia back to good manners; and Englishmen are told to bear in mind, "that there is such a thing as settling a dispute in a manner the most satisfactory by administering a good knock-down blow at once."

The conclusion to be drawn from all this vaporizing (which, looking to the actual state of affairs in the East, would have been quite as appropriate last week as the present), is simply this—that Ministers would fain have it believed that they are quite ready for war, and resolved, if necessary, to "strangle the Russian fleet in the cradle of Odessa." The remarks in the Austrian journal, and those which have appeared in the *Times* and *Globe*, are merely newspaper protocols, and as such of very little value. The proceedings of Russia must determine whether we shall go to war or not. If the Emperor is resolved at all hazards to become master of Constantinople, the Euxine, the Levant, and the Adriatic, there seems to be no help for it, and a war must ensue. The policy, therefore, of our Government and that of Louis Philip in making preparations for it, is undoubtedly a sound one. And it was extremely "idle" in our Ministerial organ to endeavor to lessen the effect which those preparations were intended to have upon the designs and proceedings of Russia, by representing the intentions of France and England as being so pacific. The fact is—and now we find it announced clearly enough—that if Nicholas yields, we shall all be good friends; if he persist in his schemes of aggression, our actions will no longer be pacific.

That Russia, will however, hold back, for the present, seems most likely. Excellent reasons may be assigned for her continuing to practice the temporizing policy by which she has hitherto gained so much. It will depend upon the degree of vigilance used by British and French statesmen, whether that policy shall in future be as successful as it has been hitherto.

{From the London Times of January 6.]

The *Journal des Debats* seems to be of opinion that Russia will yield to the remonstrance of Great Britain and France, backed by their preparations for hostilities, and will consequently relinquish the immediate execution of her designs upon the Turkish capital and its neighboring ports. We have no doubt that the maritime preparations of England, and the mixed ones made by France, might, though unaccompanied by any formal remonstrances, have a better effect than merely modifying or suspending the realization of the aggressive schemes entertained by Russia; provided the latter Power could be convinced that the preparations of this portion of Europe were real armaments—that they were calculated for purposes of actual resistance, instead of being what are commonly called "demonstrations,"—measures got up for the sake of intimidating an enemy, and, failing in that object, to be at once laid aside, and followed by humble acquiescence. There is nothing so silly as a "de-

menstration" which bears upon the front of it that it is a demonstration, and nothing more. Wiser by a great deal to do nothing, for in the latter case we save all useless expense, and leave our resources in that respect undiminished. The Tories, combined with the low Radicals, through their daily and weekly prints, are laboring to persuade the people of this country that the period has long since passed at which it would have been possible for England to interpose any serious check to the march of Russian encroachment, and with consistent wickedness they flatter the Autocrat, not only that he is too strong to be resisted, by this country, but that his designs are just and meritorious, and such as he ought not to abandon. This is of a piece with the factious treachery which has encouraged the stubbornness of the King of Holland during these two years, and advised him to hold out against the pacific endeavors of England towards the settlement of the dispute with Belgium. "in hopes that something might turn up," either on the Continent through a war, or by a change of Ministry and the return of Tory councils here in England. We do not deny that in days of yore some examples of the like spirit may have been found to actuate the movements of persons who were not Tories. The memorable instance of Oczakow cannot in common justice be overlooked, when an opposition embassy was despatched to the Empress Catherine, and assurances held out to her that by a due degree of obstinacy she would defeat the plans of the British Government of that day—a council on which she had cunning enough to act; and the consequence was, that Mr. Pitt's resistance to the project of the female Autocrat miscarried, although the other half of the factious undertaking failed, for the Minister retained his office. Why do we recur to these crimes of another generation? To condemn them—to give weight to the stigma with which we would persuade the people of England to visit the present iniquities of the ultra-Tory junta, as manifested in their Dutch, their Portuguese, and the Russo-Turkish counteraction (it is all but treasonable) of the measures adopted by the King of England for the maintenance of British interests and honor. The attempts to keep open the discord of the Dutch and Belgians, in which the English Tories have so largely shared, have hitherto served in no small degree to distract the ears of this Government and of the French from the affairs of Turkey, and to weaken their joint opposition to the Autocrat in that quarter. But the rapid growth of the danger is, we trust, helping out the remedy. We have said that a demonstration once discovered to be a demonstration on the part of these two Governments, is worse than none; of little value, moreover, is a remonstrance carried on in words, and ending in resignation. Russia has so deep a stake in the game she is now playing, that she laughs at the murmurs, and not less at the threats of other Governments, as she will at their noisiest preparations for war, if she have any solid reason to suspect that, after all, no war will be ventured on by the parties making them. So great, besides, is the object aimed at by Russia, and so keen and intense her passion for realizing it, that if she suspend her work to-day, she will resume it to-morrow, entailing on England an incessant course of watchfulness, and extreme uneasiness on the whole European world. The maritime force of this country, therefore, ought to be maintained on a highly effective footing, and not a moment lost in the presence of an enemy so unremitting in his activity, and so powerfully impelled towards the accomplishment of his fatal design.

It is rumored that Austria has given pacific "advice" to Nicholas, which may induce him to desist from this odious undertaking. Austria is the China of the west. Stupid and immovable in the dotage of despotism—hating all knowledge, because dreading all change—Austria "advises" Russia. But will the Czar, untouched by the angry remonstrances of England, be shaken from his purpose by Austrian advice? England must take counsel from her own courage and foresight—they are the sure safeguard of individuals and nations.

We see that M. Pozzo di Borgo on Wednesday last complimented the French King in decorous terms, and delivered some vague prognostics favorable to the continuance of tranquility. It is the policy of Russia, as of all mediators of aggression, to cover ambitious purposes in the garb of peace. The representatives of the French people are, however, at their post. M. Dupin, President of the Chamber of Deputies, thus expresses himself to Louis Philippe—"Peace, as far as it may be possible; but such a peace as you can alone desire—a safe and honorable peace, worthy of the nation."

These are not words which indicate any deep-rooted confidence, in the phrases of M. Pozzo di Borgo. The winter season for the present paralyzes all movements, but half the winter season has gone by.

In France naval preparations on a considerable scale were in progress. The answer to the King's speech was under discussion in the Chamber. The ministers had elected all the officers of the Chamber but one, M. Pirell, the Advocate General, whom they proposed for one of the Vice Presidents, but he was defeated by M. Beranger 165 to 98.

M. Pirell has rendered himself very obnoxious by persecutions of the press.

Sir J. Campbell remained still a close prisoner in the Castle of St. George, Lisbon; and the British Ministry has declined to interfere in his behalf.

The Portuguese quarrel is stationary.

Don Miguel had rejected an offer of mediation, made to him at Santarem, by the Queen of Spain; whose Ambassador, Baron Rameford, had an interview with him on the 17th of last month. General Rodil had made a fresh incursion into Portugal, as far as Braganza, in search of Don Carlos; but only succeeded in capturing some of the Junta who attended him. There are rumors of naval preparations by the agents of Don Miguel; and it seems to be allowed that he has lately been successful in recruiting his army from among the peasantry. In the mean time, hostilities have not recommenced.

In Spain the quarrel assumes more and more the character of a guerilla contest.

The insurgents in Biscay, Navarre, Arragon, and Valencia, are again appearing in considerable force. The Queen's troops had been defeated in some skirmishes; and the rebels were sufficiently strong to make a formidable attack upon Tolosa, on the 26th of December; but were successfully resisted. Zavallo, the General of the Franciscans, who is mentioned as the real leader of the Monkish party, has been negotiating with General Valdez; but he assumes too high a tone to make it probable that an accommodation will be the result of their communication. The Madrid correspondent of the *Times* says—

"It is known that Zavallo was at Bilbao at the time of the death of King Ferdinand; and it was there that, as soon as the intelligence arrived, the insurrection broke out into 'a sudden flood of mutiny.' Judging of the rest of Spain by what he had observed in his own immediate neighborhood, Zavallo had expected that the rising would be general; and it would undoubtedly have been much more general than it has proved, had the Pretender only ventured, when the tide turned in his favor, to show himself in the country. But the time has gone by; and the cause of Don Carlos is not to be saved by all the skill of Zavallo, nor by the high tone he assumes in his correspondence with General Valdez."

In fact, there seems no reason to apprehend serious danger to the Queen's throne from the insurrection; though, from the nature of the support it receives, and the miserable state of the Government finances, it may be extremely troublesome for some time to come. In Madrid, Zea Bermudez is more unpopular than ever; and the new Minister at War, Zarco del Valle, is not in much better odour.

The *Indicateur* of Bordeaux of the 31st ult. has the following from Bayonne, dated the 29th ult.:—"Saarsfield's return to Pampeluna with 3 000 men, having left a similar number at Tafalla, is confirmed. The conduct of this General has appeared very suspicious, not only to the inhabitants of the country, but also to his own troops, who remarked that in his recent march he always took the opposite direction to that of the insurgents. There is also much complaint that Saarsfield has disarmed the forces of Gen. Lorenzo, who occupied Estella. The greater part of the troops of the latter have been replaced by others, who have not given the same proofs of valor, and who are not so accustomed to conquest as those removed. All the Queen's troops are about to march, in order to attack, in every direction, the Carlist bands that are spreading desolation through the country. Of the Valencia faction only forty men remain between that province and Arragon."

STILL LATER FROM FRANCE.—By the Havre, from Havre, we have Paris papers of 8th January. These present the case of the Queen of Spain in a somewhat more favorable aspect; but still without any material change.

There is nothing further of a decisive nature as to Russian affairs: of speculation concerning them and plain talk in the Chamber of Deputies a great deal—of which, with more leisure and space, we will translate portions for our readers.

The *Journal des Debats* in commenting on that part of the President's message which refers to the non-payment of the French indemnity, holds this language: "We hope a legislative vote will soon put an end to the only difficulty which exists to the completion of the treaty concluded with this country. All is not sacrifice for France in this Convention; and the benefits assured by it to our commerce will at least compensate for the payment of a debt against which our integrity would not permit us to plead prescription."

PARIS, Jan. 7. Evening.—The Stock Market has been animated to day, and the price of stocks has experienced a further improvement, which is attributed to a rumor that the Government will have no need to have recourse to a loan. A rumor of the capture of Oporto by the Miguelites has been current, but it produced no effect, as Don Miguel's Loan remained stationary without business.

On Sunday the Ambassadors of all the Northern Powers assembled at the Russian Embassy, when it is said Count Pozzo di Borgo communicated to them a Note he had received from the Minister for Foreign Affairs relating to the affairs of the East.

The *Sentinelle*, of Bayonne, of the 2d inst., has the following extract of a letter of the 25th ult., from Madrid:—"Gen. Quesada has succeeded in destroying all the bands which were formed in Castile. Several of their chiefs have been shot. It was with great difficulty and risk of falling into the hands of the Queen's troops that Merino gained Portugal with 16 of his followers. It is certain that the Queen's army is to enter Portugal, but it must previously be reorganized, for the corps of Morillo and Rodil are not worthy of the name of an army. Some politicians assert that it is intended to drive out Don Carlos and Don Miguel, and to join Don Pedro in establishing the government of Donna Maria throughout Portugal. Others, however, affirm that the Spanish Cabinet has an understanding with France and England for driving out both the pretenders to the throne, and taking possession of the disputed kingdoms. But this is highly improbable, for the Spanish government, which cannot yet be said to be master of its own provinces, is little capable of effecting the conquest of a country defended by the army of Don Pedro, which is much more perfect in the art of war than that of Spain, without reckoning the troops of Don Miguel, which would also act against the invaders. The *Sentinelle* also states the arrival of letters from Bilbao, announcing that a terrible conflict took place on the 30th ult. at Durango, between the Queen's troops, commanded by General Valdes, and the Carlists, under Zubala, in which, it is said, the Christians were beaten, and lost two pieces of cannon."

The Memorial Bordelais of the 3d instant, gives the following, under the date of Madrid, December 25th:—"The troops of Morillo, seconded by the Government, have entered the Portuguese territory, and seized 40 Carlists, whom they have brought into Spain."

A letter of the 30th ult. from Bayonne, states, that General Lorenzo, after a severe contest at Los Arcos, has beaten the insurgents of Navarre, who were compelled to fall back upon Logroño.

LATE AND IMPORTANT.—The Editors of the Daily Advertiser, have received by the Francis Depau, which put into England, and sailed from Falmouth, on 24th ult., files of London papers to the evening of the 18th January, containing Paris dates to the 16th, and Madrid to the 9th, eleven days later than those previously received. It appears, says the Daily Advertiser, that Catalonia has risen en masse, and demanded a Constitution. General Valdez has returned to Spain, and Mina was probably on his way back. The Liberals so long persecuted and exiled have arisen, and are in a fair way of compelling the milder government of the Queen to yield to their determined demands. From Portugal we find nothing of interest. The London Courier, of the 18th

of January says:—The French papers of Thursday speak of the change in the Spanish Ministry, which we yesterday mentioned as one of the rumors of the Stock Exchange. Some of the papers, however, trace it up to the messenger which had arrived at the English Ambassador's. More than one of them speak of this series of events—the demands of Llauder, and the other Captains General, combined with the number of persons who have taken an interest in the proceedings in Catalonia—as a true revolution in Spain. We observe that General Don Jose Valdez, with other Constitutionalists, have returned to Spain from Paris. Mina will probably also now find his way back. The other news from Spain is of trifling importance.

LATEST FROM PORTUGAL.—The Pantaloon arrived at Falmouth on the 17th Jan. from Lisbon, with dates to the 13th. The differences between the Government and the Duke of Terceira were settled. The army of Don Miguel had suffered considerably from sickness. No movement had taken place between the armies. It is stated that Don Miguel's forces were not more than 6000; but the fortifications are so strong that it would require a much greater force to dislodge them.

PARIS, JAN. 16.—It has been remarked that Baron Rothschild makes frequent visits to the Minister of the Finances, the object of which probably is to settle the conditions of the new loan.—[Journal du Commerce.]

The National de 1834 gives the following details upon the communication of Gen. Llauder to the Queen of Spain, which are of considerable interest.—“We are informed upon good authority that the Queen, after having consulted her Ministers, and the diplomatists at her Court, returned, without opening it, the Exposition which General Llauder had sent by Colonel Sans. On receiving it Llauder proceeded to the Municipality of Barcelona, and held a conference as to the next steps to be taken. He proposed a middle course, through which the remonstrance might reach the Queen without offending her; but he received for answer, as on former occasions, that it was too late to retreat, and that, if he did not feel sufficient confidence in himself to sustain with courage the part he had undertaken, he had better quit the Province. Llauder upon this put the packet under another cover, and sent it again to the Queen as she had returned it, without any additional letter. Thus the Governor of Catalonia conducts himself towards the Queen of Spain as one sovereign would towards another, and this exchange of communications assumes a most singular hostility. If any one doubts the truth of the above details, let him apply to the Minister of War, and we are confident he will not contradict them.”

The Memorial Bordalets of the 13th inst. confirms in the following terms the news of the resistance of the Captains-General to the Spanish Government:—“We have received news of the utmost importance, through several different channels. Catalonia has risen in a mass in the name of liberty, under its military chieftain, Llauder. This is the first cry of Constitutional Spain. Llauder has demanded of the Queen, in his own name, as well as in that of the 45,000 armed men which he has at his disposal, liberal institutions. Madrid is tranquil, but disquieted by Llauder's demand. There is reason to believe that several other Captains General, such as Quesada, Valdes, Merillo, are about to demand the dismissal of the Ministry.—We ardently desire the success of this revolution, for such it really is.”

The Indicateur of Bourdeaux, of the 13th inst. has the following from Bayonne, dated the 11th:—“A courier from the British Embassy at Madrid arrived here last night; he left that capital on the morning of the 8th, when all was perfectly quiet, and performed the journey without the necessity of an escort. The courier has important despatches from the Court of St. James's and the Tuilleries, the Captain-General of Catalonia having, in the name of that province, demanded a Constitution of the Regent; the number of signatures to the address is said to be nearly 50,000. This it was which occasioned the dispatch of the courier. By a decree of the Regent, El Pastor had been appointed Brigadier, and consequently is annulled; it is well known that he, as well as Mina and other chiefs, were banished for the attempts made in November, 1830.”

The Vapor of Madrid states that Don Gregorio Alvarez y Perez, a canon and treasurer of the church of Burgos, had been arrested, and was in the chapel preparing for execution, when a courier arrived with his pardon. He was so much affected, by this unexpected clemency, that, immediately on being released, he wrote and published a pamphlet, exposing all the manoeuvres used to mislead the people, and urging them all to range themselves under the banner of their lawful Queen.

PARIS, JAN. 15.—It has been asserted on ‘Change that the Queen, yielding to the necessity in which she is placed, has consented to the convocation of the Cortes, and has changed the Ministry. The President of the new Cabinet is said to be the Marquis de las Amarillas.

This news, whether true or false, produced some improvement in Spanish Stock; the French Funds also recovered a little.

The only news from the frontier that is worth mentioning, is that of a new combat on the 9th with the Carlists, commanded by Zabala; in consequence of which they were again dispersed.

The letters from Bayonne speak also of the arrival at Vittoria of 4,000 recruits, who are to be immediately incorporated with the troops.

Famine in Russia.—The Swabian Mercury gives the following letter from Odessa, dated Nov. 23:—“The general dearth becomes very alarming, and it is impossible to foresee what may ensue. Every article that forms the food of man is becoming daily more and more scarce and dear. Meat alone is cheap, and this is because the granaries are obliged to kill their cattle for want of fodder. There are whole villages in the environs of Odessa that are entirely destitute, the inhabitants having left them, in hopes of finding bread elsewhere. The Sea of Azoff is no longer navigable, so that we have no chance of receiving supplies from the opposite shore. Immediately after receiving despatches from St. Petersburg, Count Woronzow

went off in all haste to Ekaterinodol, where the famine has already caused some deplorable disasters.”

Manufacturing Industry.—All the information we have received from the manufacturing districts leads us to believe that the operations of trade will be materially impaired by the present position of the United States. Almost every letter we have seen from America containing a caution to manufacturing and shipping houses not to send out goods, as there is no money to pay for them. We are glad to find in many instances manufacturers are acting upon this caution.—[Morning Post.]

LONDON, January 18th, 19 o'clock.—Previous to the close of business yesterday afternoon, in the Stock Exchange, an improvement in the Consol Market was expected, the last quotation having been 80½ for the account, at which price it opened this morning. A sudden decline, however, almost immediately occurred, some transactions being effected at 79 for the account; and numerous reports were in circulation relative to the resignation of Lord Grey, which was positively stated to have been accepted, according to some reports, in consequence of a difference upon the Portuguese Question; and to others, upon the Church Reform. Up to the present time, no confirmation of any of the rumors has been received, and a slight advance has taken place in Consols, which are now quoted at 89½.

Half past One.—The Consol Market is again a shade better, the present quotations being 87½ for Money, and 89½ for the account. Bank Stock is 211 2½, and India Stock, 240 2½. Exchequer Bills are 44 40, and India Bonds, 32 24 prem.

In the Foreign Market, Dutch Five per Cent. is at 94½ 85; and the Two and a Half per Cent. 49½; Belgian 95½ 96; Russia 103 to 4; Portuguese 57½; Keyency Bonds 57½; and Spanish 23½. Brazilian Stock is 67½ 68; and Mexican remains without any fluctuation at 37½ 37½, the letters brought by the packet contain no political news of importance.”

LATE AND IMPORTANT FROM SPAIN.—The following intelligence from the Daily Advertiser, furnishes information from Europe more important than any before received for a long while.

The effect throughout Europe of the ascendancy of liberalism in the councils of Spain—if that ascendancy can be maintained and confirmed—can hardly be conjectured.

There are later papers, too, from London, by two days—up to the 20th; and from Liverpool, of the 18th.

Extracts from these follow:

The Editors of the New York Daily Advertiser are indebted to the late Governor Cabrera, now an exile in this city, for the following highly interesting intelligence, received from his respectable correspondents, at Cadiz, under date of 22d January, by the brig Herald, which arrived at Boston on Monday last, having sailed on the 22d, the date of the letters, and which are from the most authentic sources.

The dates from Madrid are to the 17th of January, nine days later than those received by the latest arrival here, viz.: the Francis Depau, from England.

On the 16th January a most daring and deep-rooted conspiracy of the Carlist party was discovered.—The plan was to destroy the Queen Regent, her two daughters, the Infant, Don Francis, his wife, and all his children—in fact, to destroy all the Royal family. Many of the most distinguished persons, of all ranks, had been arrested and thrown into prison.

The Liberals became so indignant at the conduct of the Premier, Zea Bermudez, and his fellow ministers—by whose negligence the conspiracy had been so near being accomplished—that they repaired to the house of Zea Bermudez on the night of the 16th, for the purpose of destroying him; but being unable to find him, they vented their rage by destroying all the furniture and valuables.

The excitement was so great that the Queen Regent changed her government at once, by removing all her Ministers except Zarce Del Valle of the War Department. Martinez de la Rosa is appointed Premier, in the place of Zea Bermudez; Gareli is called to the Department of Justice; Vasquez Figueras, Minister of the Marine; and Aranadale to the Finance Department.

Nearly all the Captains-General of the various Provinces have addressed the most energetic representations to the Queen, requiring a representative government, and demanding the immediate assembling of the Cortes. A new state of things had taken place; the Liberals were again in power; and exiles from foreign countries were returning to the land of their nativity.

ENGLAND.

LONDON, (Thursday Evening, 1-2 past 7.)—The line to be adopted by Great Britain and France in respect to Russia and Turkey being now generally understood as implying no interruption to the general peace, the sensation in that direction is rapidly subsiding. The British and French fleets in the Mediterranean have been ordered—the former to Malta, and the latter to Toulon.

The exportation of horses from this country to Portugal is very extensive, but several hundreds have been detained for some days past at Portsmouth,

either from the want of conveyances, or the unfavorable state of the weather. One dealer alone has forwarded to that place upwards of five hundred horses since the first inst.

FRANCE.

Chamber of Deputies.

JANUARY 13.—The Duke de Broglie, on taking his seat on the Ministers' bench, was congratulated by several Deputies on his recovery from indisposition.

M. Benjamin Delessert read to the Chamber a proposition relative to the establishment of Savings' Banks. The following is the substance:—

1. There shall be established successively in each chief town of every Department, a Savings Bank.

2. The Prefect shall nominate a Commission in each locality, to inspect and control the deposits and repayments.

3. This Commission, the members of which shall give their services gratuitously, shall have for President the Prefect or the Sub-prefect.

4. The Receiver of the Department, or of the Arrondissement, shall undertake the charge of Treasurer.

5. Deposits may be made once a week. No smaller sum than 1*fr.*, and no greater than 300*fr.*, to be received at one time, and from one person; and the deposits belonging to any one individual are never to be allowed to exceed 3000*fr.*

The Minister of Finance presented a project of law, having for its object the execution of the Treaty with the United States of America.

AUSTRIA.

VIENNA, JAN. 5.—All is silent respecting the Eas the French Ambassador has despatched a courier to Paris, probably in consequence of the last accounts from Constantinople, which announced the departure of the English and French squadrons. The tone of the English journals is indeed very warlike, but nobody is deceived by this: for the aversion of the English nation to a war is well known; the funds are rising; the negotiations respecting Belgium seem to be proceeding, and it is hoped that by the serious intervention of the Powers, they will at length be brought to a conclusion. Count Lalain, Belgian Chargé d'Affaires here, is said to have received another appointment. Count Belle Brake, the Danish Secretary of Legation, is going in the same capacity to St. Petersburg.

TURKEY.

CONSTANTINOPLE, DEC. 17.—I refer to my letter of the 11th inst., and inform you that the energetic remonstrances of the Porte have succeeded in obtaining the withdrawal of the French and English squadrons, which had been considerably reinforced. The English and French Ambassadors sent the day before yesterday directions to the Commanders of their respective fleets to return to Malta and Toulon, there to remain until further orders.

The news of the retirement of the combined squadron has produced the best effect; it is now hoped that all existing differences will be shortly adjusted amicably.

ITALY.

The letters from Bologna to Jan. 5, say that several persons of distinction at Modena have come to Bologna, to escape the new persecutions which have lately taken place in the Duchy. Among these persons is the son of Count Coupani, ex-Governor of Modena, M. Garofoli, ex-Chief of the Police, Marquis Campori, and some of the Guard of Honor of the Duke. Some think that a pretended conspiracy is the cause; others that these persecutions are connected with the affair of the unfortunate Ricci, who was condemned to death by a military commission, and shot in July, 1832. The truth is, that the Ministry de buon governo, having caused to be published some further depositions of the accomplices of M. Ricci, several persons look at Modena and Bologna as named in them, and thereby implicated. Those of Modena belong to the Ministerial Departments, the Court and the noble guard. Those at Bologna are of the first distinction; but among them are some who have not political opinions; others who, on account of their age, are exempt from all suspicion; for instance, Prince Buccionchi, son of Elisa Buonaparte, who was killed by a fall from his horse at Rome, on Easter day, last year. This pamphlet, which has been published at Modena, has been received at Bologna, where it is the general subject of conversation. But at Modena on the 29th December, it was made the order of the day to all the corps of volunteers, in order to animate the peasants in favor of the Duke, and to excite their animosity against the persons named in these depositions. Colonel Fabbri, the Commander, made them renew on this occasion the oath of fidelity, and swear again to exterminate the Liberals.

[From the National Intelligencer of Feb. 19.]

OBITUARY.—Died, about meridian, yesterday, in this city, **WILLIAM WIRT**, Esq. aged about 62 years. In him, his family have lost all that can be lost, in one among the most tender, devoted, and enlightened of husbands and fathers.

Of all who witnessed the strong and heart-endearing ties which this event has sundered, there lives not one but must sympathize, from his inmost soul, with the amiable and exemplary wife, who at once imparted and partook the purest and highest enjoyments of conjugal union, and who is now to see a premature grave open to receive the mortal remains of him who was the source and the object of the hallowed affections by which that union was cemented and embellished—with children, to whom the hand is now cold and motionless, which but yesterday led them, with paternal solicitude and unerring aim, through the paths of human science, in all the intricacies of which the exercises of studious youth, and the sustained application of mature years, had instructed him, and which his genius had illustrated; to those children, the eloquent tongue, though not yet mute to grateful memory, no longer speaks, in living accents, precepts of wisdom, morality, and piety, so lately enforced by the example, and adorned by the life and manners of a Christian, a scholar, and a gentleman.

His country, indeed, has lost a citizen whose talent and virtues, always adequate to the highest tasks of public service, were always devoted, with unflinching patriotism, to his country's good: but to that country he has left an inheritance in the extended fame which will perpetuate his name with the enduring monuments of the age and land in which he lived.

His professional brethren must largely participate in all the causes of profound regret, both general and particular, that can effect either communities or individuals. Lamenting him as a brother, whom in life they loved with brotherly affection, and admired as the ornament of their profession; they have lost no time in evincing their alacrity to manifest their respect to his memory; and will, doubtless, follow out the first promptings of a spontaneous and all-pervading sentiment, and give unequivocal and lasting tokens of the sincerity and depths of their affection, their admiration, and their regret.

TRIBUTES OF RESPECT.—At a meeting of the gentlemen of the Bar of the Supreme Court of the United States, and of the Officers of the Court, at the Court Room in the Capitol, on Tuesday, the 18th instant, the Hon. B. F. BUTLER, Attorney General of the United States, was called to the Chair, and the Hon. JOHN SERGEANT was appointed Secretary:—whereupon,

Mr. WESSER rose, and addressed the Chair as follows:

It is announced to us that one of the oldest, one of the ablest, one of the most distinguished, members of this Bar, has departed this mortal life. **WILLIAM WIRT** is no more! He has this day closed a professional career, among the longest and the most brilliant, which the distinguished members of the profession in the United States have at any time accomplished. Unsullied in everything which regards professional honor and integrity, patient of labor, and rich in those stores of learning which are the reward of patient labor, and patient labor only; and if equalled, yet certainly allowed not to be excelled, in fervent, animated, and persuasive eloquence, he has left an example, which those who seek to raise themselves to great heights of professional eminence, will, hereafter, emulously study. Fortunately, indeed, will be the few, who shall imitate it successfully!

As a public man, it is not our peculiar duty to speak of Mr. Wirt here. His character, in that respect belongs to his country, and to the history of his country. And, sir, if we were to speak of him in his private life, and in his social relations, all we could possibly say of his urbanity, his kindness, the faithfulness of his friendships, and the warmth of his affections, would hardly seem sufficiently strong and glowing to do him justice, in the feeling and judgment of those who, separated, now forever, from his embraces, can only enshrine his memory in their bleeding hearts. Nor may we, sir, more than allude to that other relation, which belonged to him, and belongs to us all; that high and paramount relation, which connects man with his Maker! It may be permitted us, however, to have the pleasure of recording his name, as one who felt a deep sense of religious duty, and who placed all his hopes of the future, in the truths and in the doctrines of Christianity.

But our particular ties to him, were the ties of

our profession. He was our brother, and he was our friend. With talents, powerful enough to excite the strength of the strongest, with a kindness both of heart and of manner capable of warming and winning the coldest of his brethren, he has now completed the term of his professional life, and of his earthly existence, in the enjoyment of the high respect and cordial affections of us all. Let us, then, sir, hasten to pay to his memory the well deserved tribute of our regard. Let us lose no time in testifying our sense of our loss, and in expressing our grief, that one great light of our profession is extinguished forever.

Mr. WESSER concluded by submitting the following resolutions, which were read, and unanimously adopted, viz:

Resolved, That the members of this Bar feel, with deep sensibility, the loss which the profession, and the country have sustained, in the death of **WILLIAM WIRT**, a member of this Bar, and heretofore for many years, Attorney General of the United States.

Resolved, That we cherish the highest respect for the professional learning of the deceased, for his varied talent and ability, for the uprightness of his professional life, and for the amiable and excellent qualities which belonged to him as a man.

Resolved, That to testify these sentiments, we will wear the usual badge of mourning for the residue of the term.

Resolved, That a Committee be appointed to offer to his bereaved and afflicted family, the condolence and sympathy of his brethren of the Bar; and to request that he may be interred in the City of Washington, and that his professional brethren be permitted to raise a suitable monument to his memory.

Resolved, That Mr. SOUTHWARD be requested to pronounce a discourse before the Bar, upon the professional character and virtues of Mr. WIRT, at such time, during the present term, as may suit his convenience.

Resolved, That the Attorney General do move the Court that these resolutions be entered on the minutes of their proceedings.

The following gentlemen were appointed by the Chair to compose the Committee ordered by the fourth resolution: Mr. SWANN, Mr. JONES, Mr. WESSER, Mr. CLAY, Mr. SOUTHWARD, Mr. SERGEANT, Mr. PETERS.

[From the Daily Advertiser.]

NEW YORK COLONIZATION SOCIETY.—The first meeting of the New Board of Managers of the Colonization Society was held on Monday, 17th ult. and was very fully attended—President Duer, of Columbia College, in the Chair. Samuel Ward, Esq. having declined the office of Vice President, the Rev. Dr. Bangs was elected in his room.

A committee appointed for the purpose of reporting the draft of an Address to the public on the subject of the affairs of the Parent Society at Washington, and the operations of this Society both present and in prospect, made an interesting report on those subjects, which was read and adopted.

The board determined, with great unanimity, to send a pioneer expedition to Africa, in May, for the purpose of making the necessary arrangements for the immediate foundation of the contemplated colony. For this purpose, Mr. Israel M. Searle, a graduate of Amherst College, was appointed to take charge of the same, under the superintendence of the Rev. Mr. Spalding, who had previously been appointed principal agent of the Society in Africa.

A resolution was likewise adopted for holding a public meeting at the Brick Church in Beekman st. on Tuesday evening next, for the purpose of giving more full and particular information on the subjects contemplated by the enterprise.

The report above-mentioned, after a recapitulation of the difficulties and embarrassments which the Parent Society has experienced from a defective organization, and the consequent indebtedness which they had incurred beyond their income, gives an account of the re-organization of the institution at the annual meeting at Washington in January last, under a much more effective and energetic system, with a statement of the pecuniary resources for the liquidation of their debt, and for the expenses of their future operations. We have not room for the insertion of the report at length, but the following extract from it will be found more immediately interesting to the auxiliary society, and the public, in this city.

"A new and important principle of action is also about to be adopted for the future operations of the Society. The Parent Board will probably hereafter wholly abstain from the superintendence in detail of transporting emigrants to the colony; and leave to such of the auxiliary and local Societies, as choose to undertake it, the labor and expense of collecting emi-

grants, sending them to Africa, and providing for them on their arrival, and until they can sustain themselves.

It appears to be generally expected that the Parent Society will confine itself to, and find sufficient employment in, governing and defending the Colony, enlarging its territory, fostering its civil, religious and literary institutions, and placing them on a broad and permanent basis. It will, however, and no doubt ought, to retain and exercise the power of controlling and regulating the auxiliary and local societies, in their mode of conducting emigration.—It should certainly prevent them from sending improper emigrants, or in too great numbers, or at improper times, or without necessary provision for their comfort and health during the voyage, and for their prosperity and happiness after their arrival in Liberia.

The Parent Society will, however, judge for itself in marking the lines of its future duties, and in that respect be regulated by wise and enlightened councils. But by dividing, in the manner suggested, the labor and responsibility, and securing the active co-operation of a greater number of devoted friends in different parts of the country, and at the same time acknowledging and yielding to the control and direction of a wise and efficient central head to check all extravagant or irregular action, the business of colonization hereafter, we trust, will be conducted with greater care, regularity and economy.

In conformity with this principle of action, the Colonization Society of the city of New York will hereafter itself expend in colonization, the money which shall be raised under its immediate auspices. To enable this Society to do that, the Parent Society has given us permission to establish a new settlement, to be called New York, at some suitable location in Liberia—and to direct all our energies and expend our resources upon that object.

In prosecuting it, we shall not endeavor to see how many free persons of color we can, by our own efforts, send to Africa; nor how many slaves we can emancipate. But our great aim will be, to promote, by all the means in our power, the true interests of those who may emigrate to our settlement, and the true interests of the Pagan population among whom they settle.

To this end our colony will be founded on the following principles:

1st. The selection of such Emigrants only as are Members of the Temperance Society, and of unexceptionable moral character.

2d. The settlement of them under such circumstances as will promote Agriculture, especially the cultivation of the staples of the African soil, such as rice, cotton, sugar, and coffee.

3d. The adoption of a system of universal education, and to provide at once the means of instruction in letters and the useful arts of life, not only for the colonists, but also for the native Africans who may live in the settlement and its vicinity.

4th. The entire prohibition of the use, and traffic in ardent spirits—except for medicinal purposes.

In view of the facts and objects above presented, the Colonization Society of the city of New York have adopted the necessary measures, to secure an efficient Board of Managers, and responsible and active officers and agents to conduct its future business and operations. The Society has resolved to establish a colony, and has already an exploring agent employed in Africa, to examine Cape Mount, the site of the contemplated colony—and if it shall be found an eligible position, to make the necessary arrangements for the reception of the pioneer emigrants. If the Society should be disappointed in the eligibility of this site, another one will be sought, and the like arrangements made. The Society, therefore, earnestly and respectfully invite the co-operation and support of their fellow citizens, in executing this interesting and benevolent enterprise. They pledge themselves that all money and property, contributed to this object, shall be faithfully and economically applied.

WM. A. DUER, President.
IRA B. UNDERHILL, Rec. Secretary.
New York, Feb. 17th, 1834."

The Rev's Dr. Channing and Gannet, were lately summoned before the Grand Jury of Boston, to give testimony respecting a duel, but refused to disclose what they knew of the matter. The Grand Jury immediately made a representation to the Judge of the Municipal Court, who summoned those gentlemen before him, and they appeared. The result is given in the Boston Atlas.

The Commonwealth's Attorney stated to the Court the reason why these gentlemen had been summoned

and that the Grand Jury were now in Court, waiting for the decision of the Court, whether these gentlemen should be compelled to testify. He cited a passage from Starkie on evidence to show that by the common law, not even auricular confessions to Catholic priests were privileged from being testified to; that it appeared by the notes to Metcalf's edition of Starkie, that in many of the United States, confessions made to Protestant clergymen were not privileged, and that the Supreme Court in this State had settled the same principle in Commonwealth versus Drake, 15 Mass. Reported, page 161.

The Judge stated that clergymen were not exempted by the law from testifying when called before a Court or Grand Jury as to communications made to them as clergymen; "that the privilege of secrecy is strictly confined to persons acting as counsel, attorney, or solicitors, in causes, and cannot be extended to those confidentially employed in other professions; that this is a privilege secured by law to the client rather than the counsellor. He referred to the case of the Duchess of Kingston, as cited by McNally on Evidence.

Dr. Channing stated to the Court that he had thought the communications made by a parishioner to his spiritual guide were sacred, and should not be disclosed, but in relation to the present case, he was suddenly called before the Grand Jury, and had little or no opportunity for reflection upon the subject; that since yesterday he had reflected upon the circumstances, and he now considered that any communications made to him in this case, were communicated to him rather as an esteemed friend, than to a spiritual guide; he was therefore now ready to testify.

Mr. Gannett stated that he viewed the communications made to him, as made in his character as a spiritual guide, and whilst he wished all artificial distinctions in favor of the clergy might be abolished, he hoped the Court would excuse him from testifying. He then read his reasons for declining to testify in such a case.

The Judge said that he certainly respected the delicacy exhibited by the gentleman, but that he must remember that the law, as such, has no mercy, and knows no distinction of persons; that in his opinion, he was bound, as a good citizen, to testify.

Mr. G. said, feeling bound as a citizen, he would testify, although he regretted the law was such as to compel him.

BANK FUND—Pursuant to a resolution of the Senate, the Comptroller reported on Tuesday, the amount and condition of the Bank Fund, from which we have prepared the following statement:

Contribution in 1830,	\$26,983 67
" 1831,	62,627 62
" 1832,	94,295 60
" 1833,	105,139 54

Total, \$289,046 43

The investments of the fund are as follows:	
Canal debt, bearing an int. of 5 per ct.	\$8,082 40
Astor " " 5 "	92,000 00
General fund, " 4 1-4 "	178,026 01

\$278,108 41

There is due from the revenue to the capital, the sum of \$10,938 02, which, with the sum invested, constitutes the whole amount of the fund. The amount of revenue due to the capital, must, by the provisions of the act creating the fund, be paid before any part can be paid to the corporations. The revenue for the current year will amount to \$11,235 34—[Argus.]

New Post Office.—A new Post Office has been established in the town of Scaghticoke, Rensselaer Co., N. Y., called *Old Scaghticoke*, and Aaron A. Marcellus appointed Post Master.

[From the Pittsburgh Gazette of Feb. 19.]

Flour was sold in this city, yesterday, at \$2 62 1-2. Can persons, who declare that there is no pressure in the money market, account for this reduction in price?

[From the Mercantile Advertiser.]

About 100 tons of ice carried from Boston to Calcutta, by the Tuscan, had been landed free of duty, and orders given to extend the same favor to similar cargoes from whatever quarter. It was selling at 6 1-4 cents per pound.

Supposing the whole 100 tons to sell at the above rate, it would produce *twelve thousand five hundred dollars*, upon an investment, probably, including the cost of all the extra precautions for preserving the ice, of \$500.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber.

D. K. MINOR, 35 Wall street.
New-York, August 14, 1833.

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTONIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 8th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists.

Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTY, at the sign of the Quadrant, No. 63 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hartly.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833

To Messrs Ewing and Hartly.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of perusing the same.

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M^d Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1823, by his savings filed in the Patent Office. Apply, post paid. 81 R J M & F.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Esq. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, January 29, 1833.

ALBANY SEED STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wutzell, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thornburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardeners' Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principle of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1833.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off railroads—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. OGDEN, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.

Germant, and Norrist. Railroad

ml by

The North River is now open; and the steamboats Constitution and Constellation run daily.

We have by the boat that came down last night, the Albany papers of yesterday morning.

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate.
H. T. Williams to be Surveyor General of Public Lands in the State of Louisiana, in the place of H. B. Trist, resigned.

James Corcoran to be Consul for Londonderry, in Ireland.

William J. Dubbs to be Consul for Maracaibo, in the Republic of Colombia in the place of Alfred Laussat resigned.

William A. Magill to be Consul for the Island of Martinique, in the place of John S. Miereken, deceased.

Alexander Schwartz to be Consul for Riga, in Russia.

Charles J. Smith to be Consul of the United States at Para, in Brazil, in the place of Abraham R. Smith, resigned.

FOREIGN VARIETIES.

The Seine, at Paris on Tuesday, 31st Dec., rose nearly to the height of the great flood in 1740, filling the cellars, sweeping goods off the wharves, and creating much alarm in its vicinity.

Mr. Lander reached Liverpool on Wednesday, 1st January, in the Columbine, from Fernando Po. He is in excellent health, after his perilous expedition into the interior of Africa.

Cashmere Shawl Manufacture.—It is computed that there are now not less than 50,000 artisans engaged throughout Scotland in the manufacture of shawls from the Cashmere or Thibet goat. The yarn for the purpose is obtained from France.

American Forest Trees.—Public attention seems to be turning, by those who desire ornamented plantations, to the great variety and beauty of our forest trees; and particularly the oaks. "To these," says a writer on this subject, "who vindicate the practice of exclusively planting native trees, as most suitable to the country, it is answered, that they might as well refuse to grow pine apples, because they do not spring up wild in our woods, as reject the brilliant tints of the American forest trees, because nature has clothed ours in a more sombre tinge."—Above 40 specimens of American oaks are now constantly planted for sale, in the nurseries about London. We were not aware that the *Live Oak* would stand the climate of England, but mention is made of several in different parts of the kingdom, and of one particularly, a large one, in Lord Pembroke's Park at Wilton.

Sir John Herschel.—This distinguished astronomer and true philosopher, has sailed for the Cape of Good Hope—there to observe the starry wenders of the Southern sky. "To the sincere and enlightened philanthropist, it may afford," it is finely argued, "matter for proud and consoling reflection, to consider this philosopher, this emissary from European civilization, tranquilly seated in Africa at the farther extremity of that barbarous and inhospitable continent—and nightly, in what was a howling desert, only tenanted by the tiger and the hyena, or the wandering savage, scarcely more humanized—pursuing undisturbed his high vocations."

John Galt.—This well-known writer, whose precarious health for some time past, had little justified any hope of ultimate recovery, seems quite restored; and has appeared in two recent works—one in three volumes, prose, consisting of various tales, under the title of "Stories of the Study," and another of "Poems."

The Marquis of Sligo.—This nobleman who is appointed Governor of the island of Jamaica, was some 20 years ago tried before Sir Wm. Scott for inveigling British seamen from King's ships, to man his yacht in the Mediterranean. He was found guilty, and sentenced to several months' imprisonment in Newgate, which he underwent. His mother, then a widow, went into Court to intercede for her son. The stern and upright Judge was inac-

cessible; but the man was touched by the scene and by the conduct of the mother; and she soon after became the wife of Sir Wm. Scott.

* * At the commencement of the last year I offered to send the American *tri-weekly* instead of *semi-weekly*, together with two of my periodicals, in exchange to those who would publish my advertisements of the different periodicals. In consequence of this notice, the exchange list was increased to 165. I soon found that the expense would be greater than I had anticipated, yet I had made the offer, and would of course continue it through the year—as I have done. I however find it *too expensive* to continue to send as heretofore. The circulation of my PERIODICALS, (upon which the expense falls,) will not warrant it, and I must, therefore, notwithstanding the uniform kindness with which they have been treated by those to whom they have been sent, materially reduce their exchange list.

The *semi-weekly* American will hereafter be sent in exchange to those who will publish the following advertisements a few weeks for the difference of price. *New-York, January 20, 1834.*

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in *semi-monthly* form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y.: D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

D. K. Minor also publishes the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

A scientific person versed in Mechanics, Chemistry and Mineralogy, of several years practical experience in different branches of Civil Engineering, and who is also a good draughtsman, is desirous of obtaining employment either as an instructor in some public institution, or as an Engineer upon some private or public work.

He was educated at one of the first scientific institutions in the United States, and was for several years an instructor in the said institution.

A line addressed to B. at Railroad Journal Office, No. 35 Wall street, will meet with immediate attention. J 15 if

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. mls

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation. J 25 if

RAILROAD CAR WHEELS, BOXES AND

AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 772 of this Journal. ds

TO STEAMBOAT COMPANIES.

PROFESSOR RAFFINESQUE, of Philadelphia, offers a service to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid. 81 R J M M & F

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A 29 if R M & F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch,	Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
200 do. 1 1/2 do.	do.
40 do. 1 3/4 do.	do.
250 do. 2 do.	do.
800 do. 2 1/2 do.	do.

soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 4 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments, and incorporated Governments, and the Drawback taken in part payment.

A. & G. BALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. d7imeows

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MARCH 8, 1834.

The Editor of the Railroad Journal regrets that circumstances render it necessary for him to take leave of those who have encouraged him in his course by *subscribing* to the Journal, but have *discouraged* him from its continuance by omitting to pay for it. If it is *worth* reading, it is certainly worth \$3 a year—at least it costs him so near that amount, that he cannot afford to print many more than are promptly paid for, and therefore it will be discontinued after *this* number, where the *subscription for last year is still unpaid*. To those who have paid for the previous, but are in arrear for the current year, the editor will merely observe, that to them, or to him, *three dollars* alone is of little consequence; but when they consider that *his business* is entirely made up of such sums, and that there are many hundred such amounts yet due for the Journal, he trusts that each one will remit his subscription without delay; and do it also in a *U. S. Bank note*, if possible, as all others, except a few in this city and immediate vicinity, are at a *heavy discount*. Any subscriber, remitting a \$5 U. S. note, for the *current* [and ensuing year, may do so without paying postage, and he will have credit for its full amount.

Those who have paid in advance for the current year, he begs leave to tender his thanks for having thus expressed their approbation of the utility of such a work, and trusts that they may derive ample remuneration from its columns for their liberality.

Having determined to send *only* to those who deem it worth paying for in advance, yet

being unwilling to be deemed uncourteous to those who may not have had leisure or opportunity to attend to so small a matter, the Journal will be sent to all, as at present, *until the 1st of April*, that every subscriber may have ample time to remit. After that date it will not be sent, unless the subscription shall have been paid.

From the Montreal Gazette we extract the following :

Norman Bethune, Esq. of this city has obtained letters patent for a new improved principle for building steam-vessels. Of course we are unaware of the exact nature of Mr. Bethune's improvement, but he has stated to us that ever since the completion of the Manchester and Liverpool railroad, his mind had occasionally been engaged in devising some improvement in the speed of steam-vessels, but that owing to his avocations he had not leisure to give much attention to the subject. He had thought of the buoyancy of the cask, but did not discover the application of it until he read a description of Mr. Burden's new boat, which seemed to promise what he had been in search of. But upon carefully examining it, he discovered a great deficiency in safety to the passengers and cargo, in the event of an accident happening to one of the tubes, by striking a piece of floating timber or ice, end on, while under full impetus, which would cause that side to fill almost instantaneously, and the weight on deck would sink it in a few minutes to the bottom; but where the depth of water should be greater than the breadth of her deck, she would fall over on her back. To obviate such a risk has for the last four months been his study, and he has, in his opinion, happily arrived at a complete safeguard against such an accident; and in attaining that desirable end, his boat naturally acquires greater buoyancy, and of course greater speed. Mr. Bethune feels perfectly satisfied that a vessel built on his plan will make the passage to Quebec in eight hours, and return in ten, stoppages included. Should his views prove correct, two boats, built upon the new plan, would form a daily line, and starting at six o'clock in the morning from both places, the Montreal boat would land her passengers at Quebec at two o'clock, and the Quebec boat hers at Montreal at four o'clock in the afternoon, (taking the tide as it might happen to be,) and always in day-light.

Navigation of Lake Ontario.—The first vessel which plied the present season between York and Niagara, left the former port on the 20th of February—much earlier than in former years.

On Undulating Railways. By A CIVIL ENGINEER. [For the American Railroad Journal.]

SIR,—Soon after the perusal of the experiments made by Mr. Badnall on the Liverpool and Manchester Railroad, I drew up the following strictures upon them, which I send for publication, if you should think that they will contribute to the objects of your Journal.

A CIVIL ENGINEER.

MR. EDITOR,—You must pardon me—my patience is exhausted—I can no longer silently look on and see your respectable and useful paper countenancing an absurdity which nothing but the blindest species of intuition (that of an inventor for his favorite project) can support after a moment's serious reflection, aided by a knowledge of the laws of nature. But I must pause—perhaps you have thought, from my abrupt beginning, that I was about to attack another Cataline: you are mistaken—I allude to Mr. Badnall's "undulating railway," and *especially to his late experiments on the Liverpool road*, which, it would seem, were seriously witnessed by Mr. Stephenson, the Engineer of that great work.

After reciting the experiments, the conclusions drawn from them are,—“That a locomotive engine can not only convey, on an undulating way, double the load which it is capable of conveying at the same velocity on a level line, but that it can accomplish this by the employment of half its power.” [See page 789, last vol.]

That Mr. Badnall should persuade himself of the truth of this most unphilosophical conclusion, is not a matter of much wonder; but that Mr. Stephenson, who is an eminent engineer, a man on whom the epithet 'great' has, on some occasions, been conferred, should sanction it, is to me a cause no less of surprise than regret.

I have declared his conclusions erroneous; it remains to sustain my position. With this view the following observations are premised:

It is a law of gravitation, that, if a body fall freely from a certain height to the earth, its velocity is *accelerated* at each instant of time during its fall: that, *ceteris paribus*, if the same body be projected upwards with the final velocity it had acquired by its fall, it will rise to the same height from which it fell, and in the same time, before its momentum will be destroyed by the same force which generated it, in its downward course.

Bodies moving on inclined planes follow the same general immutable law,—i. e., if a body be projected up an inclination with a certain initial velocity, it will advance up the plane until its momentum is exhausted by its gravi-

tating tendency, when, if left free, it will return down the plane in a time equal to that consumed in its ascent, and at the end of its course will have acquired precisely the initial velocity of projection.

We hence perceive that no more power or momentum can be generated by a body in falling down a plane than will carry it up an equal inclination in length and degree.

These preliminaries made, we may remark that the first six experiments are of one class. We will abridge the 1st, 2d, and 7th, 8th experiments, which contain the substance of the whole set.

1st. "Two engines brought the train to a given point at the foot of the Sutton inclined plane, at which point they had attained a velocity of 19 miles per hour. One engine then left the train, and the other ascended with the load 575 yards in 116 seconds."

2d. "The power of the engine being reversed, the engine and load descended 575 yards in 84 seconds; the velocity attained at the foot of the plane being far greater than at the same point when ascending."

7th. "The two engines attained a velocity of 18 miles per hour at the foot of the ascent; one engine then left the train, and the other shut off her steam, when the whole train rose, by momentum only, 332 yards in 70 seconds."

8th. "The train descended (the engine working) 332 yards in 66 seconds."

In the first set of experiments there is an apparent inconsistency with the law of dynamics above given: that this is only specious, and not real, as Mr. B.'s fancy has led him to imagine, the latter set clearly prove, as I shall endeavor to show in what follows:

The rules of philosophizing seem to have been wholly lost sight of; for, instead of the inference the sanguine Mr. B. draws from 7 and 8, viz., that it can convey double the load, with half its power, they prove the fallacy of the preceding—at least, of the inference Mr. B. draws from them; and show a remarkable coincidence with the laws above laid down. In short, these experiments, coinciding as they do with the known laws of falling bodies, ought to have suggested that, there not being a coincidence among all, there existed some defect, mismanagement, or other adequate cause, for the apparent disagreement of the first set with known laws: instead, these laws we find virtually pronounced incorrect; because, certainly not that his experiments actually prove them so—for any man reasoning *a priori*, from these laws, would have arrived at results similar to those which the experiments develop—but because, forsooth, it would seem they are strange (to him), and perhaps because they would not otherwise account for the preconceived principle of the undulating railway!

The poet may dwell upon the beauties of the visible world, and exclaim with rapture peculiarly his own,

"The distance lends enchantment to the view."

Not so the philosopher. At the distance of 3000 miles he may throw his intellectual ken across the Atlantic, and pierce the dark atmosphere of an inventor's prejudices in the pursuit of truth. Should the inferences drawn from these experiments (the facts are not contested) be true, there would indeed be a revolution, not only in railroads, but in the planetary roads; and possibly render it necessary to remodel those laws which have so long and so well answered the purpose of guiding the planets in their courses!—laws which, we are fain to believe, most of the world would be unwilling to dispense with, even for the bonus Mr. B.'s undulating railway system can confer upon them.

We think that the first of these philosopher's stones, of which Mr. B. claims to be the happy discoverer, will be reduced to its original brass, by the consideration that the train was projected up the plane by the momentum generated by two engines, and was assisted in its further progress by one. The power then is not as Mr.

B.'s fancy has led him to imagine,—"that of one engine doing the work of two on a level,"—but of one engine aided by the momentum generated by two engines before reaching the starting point—a power as efficient and active, while it lasts, as that of the engine actually hitched to the train—a power which a form of words cannot annihilate. Had the train advanced to the starting point aided solely by the engine which was to accompany up the plane, we ask, what would have been the result? Why, plainly, the same as in the last set—equal times—equal velocities.

Unless then we can suppose that Mr. B. has discovered some method of condensing large quantities of momentum, which he may carry in his pocket, and infuse into his train before encountering one of the "bumps" of his "undulating railway system," our humble opinion is, that he will have to amend his first inference by striking out "double the load," and inserting "two-thirds, or one-half of the load," which it is capable of conveying at the same velocity on a level line: which opinion we expect to turn into an indisputable truth in the sequel of this paper.

Again, searching for the cause of the wonder which words have had the power to confer on these experiments—for the reason why, in falling down the plane, the train passes the foot at a far greater velocity than at the same point when ascending,—it should be borne in mind that, if the train had proceeded up the plane aided solely by the momentum generated before reaching it, the mass would have advanced until its momentum was exhausted, when, returning, it would have passed the foot of the plane in a time equal to that of its ascent, and at the same speed; adventitious circumstances, such as irregularities of motion, and consequently of friction upon the rails and otherwheres, as well as from the friction of the pistons of the engine, not being taken into account. The rationale of this discrepancy is readily given.

In addition to the momentum generated by the two engines, the train was assisted by one up the plane: this would operate to carry the train much farther up the plane than if left to its momentum alone; consequently, even if at the turning point this engine had been detached, the gravitating tendency would have caused the train to re-pass the foot at a far greater speed than it ascended with—since there was a much longer space in which to generate its velocity by the accelerating force. Partly from the same cause, and partly for the reason, that, after the momentum ceased to operate in propelling the load, it must have passed over the remaining distance to the turning point at a very slow rate, the time elapsing in the descent must have been much less than that expended in the ascent—offering, surely, nothing strange or unlooked for, one would suppose, by the experimenter; at least, I can vouch for it, by one who was not alchemizing for the "principle of the undulating railway." The experiment was actually more favorable to produce this disparity, since the engine worked down the plane, which would tend still farther to increase the difference of the times.

I am therefore quite at a loss to perceive the justice of inferring thence, that because, under these circumstances, the train descends more rapidly, and in a less time, over a given distance, "that one engine does the work of two on a level." The only inference warranted by the premises is, that trains, under like circumstances, will always descend more rapidly and in less time than they will advance up a given inclination. It is only by a computation of the performance of the engines in the experiment, and a comparison with the actual performance on a level; that we can pronounce upon their relative performance or advantage.

The last experiments, 7 and 8, show clearly a coincidence between the time of ascent and descent, when the train is influenced by momentum only in propelling up the plane, since

the times, as noted; do not sensibly vary from equality—aside from the working of the engine down the plane, they would have come quite up to equality.

From this experiment he could only rationally infer, that the times of ascent and descent of planes under these circumstances is nearly a ratio of equality: and not that, "on the undulating plan, one engine can accomplish double the work with half its power," since the relative performance can only be ascertained by a comparison of the computed absolute performances on the plane and on the level. These computations I shall presently submit.

In short, the inferences Mr. B. draws from the experiments are about as much warranted by the premises as one would be in estimating the value of a quantity of vegetables from the known value of a pound of cheese.

We have seen that the fact of the descent being performed in less time than the ascent in these experiments, under these circumstances, is nothing strange, nothing new, and is consistent with the laws of dynamics; that the last experiment is a direct and plain corroboration of these laws; that the inferences drawn from both sets are incorrect; that, consequently, any superstructure which may be erected upon them is—un chateau en Espagne.

These facts will appear more striking when I shall have answered the question—"What practical result may then be inferred from them?"

Submitting the performance of the first to calculation, we shall find that the rate exceeds but little 12 miles per hour; but if the engines had been permitted to continue their course on the level, it would have been 19 miles per hour. We infer, then, that if a train of cars of the weight, and under the circumstances, of those in the experiment, be brought to the foot of a plane similar to the Sutton plane—if then one engine be detached, while the remainder proceeds up the plane until the gravity of the whole exhausts both the momentum generated by the two engines and the power of the accompanying engine—and at this point the power of the engine be reversed, and the whole return down the plane—that there will always be a loss by the use of this method compared with that of the two engines working on a level road in the ratio of 2 : 3, or one-third.

If we submit the performance of the two last to calculation, we shall find a result below 10 miles per hour for the actual performance. The performance on the level would have been 18 miles per hour. We infer then that there is a loss in the use of the principle of "the undulating railway," under the circumstances of the experiments 7 and 8, in the ratio 10 to 18, or one-half.

As to curvature—shade of Newton!—that matter may be moved in a curved track at a greater velocity and with less power than in a straight line! is to say that bodies moving in curved paths do not always require an increase of power to propel them in the direct ratio of the squares of the velocities, and in the inverse ratio of the radius of curvature!—is to say that the more the curvature is sharpened, the greater the facility with which a body moves therein! (what a rapid flig htw might make to the moon by a road curving like a succession of S's!)—is to say, that when a single force is resolved into its components, that a part is greater than the whole!!

Did the English Smeatons and Rennies, and the French Pronys, seriously approve of all this? or did they smile and shake their heads?

Albany, December 19, 1833.

Further Experiments on the Liverpool and Manchester Railway, to determine the correctness of the Undulating Railway System. [From the London Mechanics' Magazine.]

Sir,—I have this morning (29th October) received your numbers of the 19th and 26th inst. My principal object in now addressing you is to make an observation or two, which Mr. Cheverton's last communication immedi-

ately demands. In the course of a few days I shall trouble you with more general remarks in answer to "S. Y.'s" objections, to which the contents of your next number may possibly enable me to add something in further reply to Mr. Cheverton.

Mr. Cheverton says, in allusion to the comparative amount of resistance on the two lines, "Mr. Badnall will not undertake the task (of showing how trivial is the difference), because it will disclose the poverty of his scheme." In the same breath, also, he observes, that "space will not allow him (Mr. Cheverton,) to show how trivial one is in comparison to the other."

Thus Mr. Cheverton, in a most unwarrantable manner, accuses me of withholding the truth when I have the power of publishing it, which truth, if exposed, would (he says) prove the poverty of my scheme; and yet, after nearly a *twelvemonth's* discussion, he, for want of space, declines to touch upon this subject. I appeal to all your readers, is this generous?

But Mr. Cheverton endeavors to sweeten this bitter observation, by saying, "I cannot believe that there is any intention to deceive, yet it suits his (Mr. Badnall's) purpose better, (though it is not dealing fairly with the public,) to take a very short distance, such as 147 yards," &c. &c.

There is no intention of deceiving, and yet I am not dealing fairly with the public!! I trust Mr. Cheverton will have the good feeling to revoke these expressions, or, at least, to explain them; and if not, I trust he will exclude Mr. R. Stephenson, Mr. Dagleish, Mr. Dixon, and the other engineers under whose joint inspection and superintendence most of the experiments were made, from any participation in a wish to deal unfairly with the public.

I am not one, Mr. Editor, who feels disposed to quibble about trifles, or, in discussions of this kind, to be disturbed by every burst of anger from an opponent whom, in this instance, I feel within my grasp; but I offer my unqualified protest against the right or propriety of any man attributing unjust motives to another, without a cause which he is able to substantiate.

Mr. Cheverton's remarks about inertia and gravity are becoming as familiar to me as my "*hic, hæc, hoc.*"

His simile of "the two boys with a swing," would, I should have imagined, (as some time ago alluded to by your correspondent "Saxula,") have led him to reflect rather more deeply on the subject before us. Had I told him, before this discussion was entered upon, that I could, by means of my own arm, and without the aid of any assistant artificial power, raise a ton weight above the level of my head, he would not, perhaps, have believed me; yet he knows very well, that if a ton weight were suspended but a few inches from the earth by a rope of sufficient strength and length, and from a prop of sufficient strength, there could be no difficulty, by gradually increasing the oscillations of the load, in attaining the required elevation,—nay, by the simple application of an equally simple contrivance, to retain the load at that very elevation when attained. Now, although throughout each oscillation of this pendulum, the effect of gravity from each descent of the weight may be said to be destroyed in the corresponding ascent, would the power of gravity, or would it not, be auxiliary in the accomplishment of this task?

With regard to 147 yards being too limited a distance to suit the trial of a fair experiment, Mr. Cheverton must blame the locomotive engine, not me. The inclined plane is $\frac{1}{4}$ mile in length, and if the Rocket engine had not sufficient power to reach a higher elevation, was it my fault? The experiments which were last tried will surely satisfy Mr. Cheverton that he has done me injustice, in supposing that I chose the worst engine, from any supposition that it would best support my arguments on this subject.

As it appears that the deductions which are

drawn by engineers from these experiments, are not fully understood by many who have perused the particulars of them, I shall beg your insertion of a diagram, published by the editor of the Manchester Guardian, which will probably be found to render my ideas as clear as they can be rendered on this subject:—

A B is a level line—B C, equal to B D, forming an undulation D B C, whose summits are of equal altitude.

The train of loaded carriages, weighing 150 tons, and moved by two engines, one dragging, the other propelling the load, had acquired from A to B (the length of this line being one mile on the railway,) a velocity of 30.28 miles an hour. On arriving at B the steam of the propelling engine was shut off, and the engine stopped. The train, then, partly by the momentum acquired in travelling over the level railway, and partly by the power of the remaining engine, ascended the inclined plane to the point C, viz. 575 yards, which was as far as the united locomotive force of one engine and the momentum could carry it. The power was then reversed, and the engine pushed the carriages back from C down the inclined plane to B, at which point it was found that the descending velocity was 31.70 miles an hour. Now, as the velocity of 30.28 miles an hour at B was sufficient, with the aid of one engine, to carry the whole train from B to C, what man living will dispute that a velocity of 31.70 miles an hour, at the same point, would, with the same engine, have enabled the train to ascend the line B D, which is supposed to be precisely equal to the line B C? On the contrary, would there not be a given velocity generated at the point D, which, the effective power of the engine being still continued, would have enabled the train to pass over another like undulation? If so, one engine could move 150 tons along the undulation C B D, which amount of tonnage she could not move on a level road, and which on a level road, whatever velocity was given to the train at starting, would bring the engine gradually to a halt.

But let Mr. Cheverton direct his attention to the two last experiments which were tried. If a momentum (momentum only), arising from a velocity at the point B of 19.04 miles per hour, carried the train 323 yards—say as far as e on the inclined plane B C—would not a momentum, arising from a velocity of 20.04 miles per hour, carry the same train to the point f up the ascent B D? If so, the Firefly engine proved her capability of moving 150 tons along an undulation e B f, by the employment of her power throughout only half the distance, and if this were the case over one undulation, will Mr. Cheverton deny that such would have been the case over succeeding undulations?

During the next week I may, perhaps, have an opportunity of trying a few more experiments: if so, they shall be transmitted to you. I have expressed my opinions to the Liverpool Directors, that the Firefly engine is capable of conveying from one summit of an undulation to another the enormous load of from 200 to 250 tons. I may have exceeded the limits of her power in this prophecy; but will Mr. Cheverton admit one point before he hears the result of any further experiments? viz. that if the Firefly, or any other engine, can move even 200 tons from summit to summit of one undulation, that she is capable of moving an equal load from one summit to another summit of a second or greater number of like undulations?

If so, what becomes of his weakest and most untenable argument, that all I gain is the comparatively trifling advantage which gravity gives me at the commencement of locomotion? I am, Sir, with great respect, your very obedient servant, RICHARD BADNALL.

October 29, 1833.

N. B.—The subject of friction, (trivial as Mr. Cheverton thinks it,) I shall not be ashamed to discuss in my general answer to "S. Y."

STEAM-CARRIAGES ON COMMON ROADS.—In the December number of the Repertory of Patent Inventions, we find the following account of the performance of a steam-carriage on common roads, which is deemed by many to be conclusive evidence of their ultimate success.

Steam-Carriages on Common Roads; with a Notice of the Journey to Stoney Stratford. [From the Repertory of Arts, &c.]

We are not disappointed in the expectations we hold out, that "steam-carriages might soon be expected on our common roads," a company being now formed for improving the roads, and running steam-carriages between London, Birmingham, Liverpool, and Holyhead: to be called the "London, Holyhead, and Liverpool Steam-Coach and Road Company," Consulting Engineer, Thomas Telford, Esq., Acting Engineer, John Macneill, Esquire.

From the moment that Sir Charles Dance introduced his carriage to Messrs. Maudslay and Field—and those gentlemen saw enough to induce them to undertake to make repairs and changes in the practical details—we were satisfied that the day was not far distant when this description of conveyance would become general; and it only required that the old carriage should be vamped up sufficiently to perform a journey of some extent, carrying such parties as could duly appreciate the performance; and who, from their practical experience, would judge whether sufficient had been done to justify them in lending their characters in the future advancement of this important project. The Brighton journey, from the admirable manner in which it was performed, naturally turned the attention of scientific men to the subject; and the regular running of the carriage between London and Greenwich for eight successive days (Sundays excepted), added to the general feeling, that enough had been accomplished to warrant that more decided steps should be taken to advance the introduction of steam conveyance on our common roads. Hence it was proposed by a number of influential individuals, that a further trial should be made of the engine, with a view to forming a company between London and Holyhead, should Mr. Telford and other engineers be of opinion that the application of steam on common roads had become practicable; and a proposition was made to Sir Charles Dance, that his steam-coach should run to Birmingham. We have already expressed our opinion that the carriage had performed more than could have been expected, from the inequality of many of its parts; and it would probably (as far as the public opinion was concerned) have been desirable not again to have put the carriage on the road; this was the opinion of many, particularly of Sir Charles Dance himself. The liberal manner however in which Mr. Telford and other engineers and scientific men had taken up the matter, and had tendered their talent to bring the carriage before the public, at once induced Sir Charles to give his approbation to the journey, more particularly as the engineers gave it as their opinion, that although they might not arrive at Birmingham, owing to the state of the carriage, together with the badness of some parts of the roads, they would be equally

well able to form a decided opinion from what the present carriage was capable of performing, as to what more might be expected from a new carriage built by practical workmen, and with due attention to the proper distribution of strength. The question to be decided was, whether the principle was good; if, after a fair trial, the answer should be in the affirmative, then there would be no doubt that, placed in practical hands, engines would be produced capable of performing with as much certainty as any other means of conveyance, and with an increased degree of speed and safety: on the other hand, should the opinion prove unfavorable, and the principle be considered defective, this knowledge must have determined Sir Charles Dance on abandoning all further attempts to realize his great undertaking. Having given these introductory remarks, we cannot but express our pleasure in recording the liberal manner in which the engineers and other scientific men have come forward to advance so great a national undertaking, and by their characters and talent have given weight to the cause in which Sir Charles has so long, so arduously, and we may now add, so successfully labored. We are happy in being able thus to state, that the question of the practicability of steam conveyance on our present roads is now set at rest; because we are aware that many and various reports have gone abroad with respect to the Birmingham trip; but we doubt not that the results which we have given will show, that what was performed on that day convinced all parties present that enough had been done.

We will conclude our notice of this subject, by giving a few particulars of the journey of the steam carriage from London to Stoney Stratford, taken from the note book of one of the gentlemen present. "On Friday, the first of November, 1833, Sir Charles Dance's steam carriage started from Gray's Inn Road, at about twenty minutes after three o'clock, A. M., passing through Highgate Archway, arrived at the Wellington (between five and six miles) in thirty-three minutes, the road being on the rise all the way. At this place coke and water were taken in. When again about to start, it was discovered that the weld at the joint of one of the tubes had given way, and that the water was flowing copiously; the carriage was run into the yard, and the fire put out, in order to repair the defect. Mr. Field, on examination, directed the man to cut out the defective part, and plug the ends; this was a work of time, owing to the want of tools. The object however was accomplished, and after four hours' delay the fire was again lighted, and the carriage once more took the road, and without further accident arrived at Stoney Stratford, fifty-two miles; at which place it was determined to dine and stay the night, and proceed forward next day to Birmingham. In the morning, on lighting the fire, it was discovered that the pipe was still defective, and would require to be removed that good joints might be made; this must necessarily cause delay. On a conversation of the parties it was generally agreed, that the practicability and economy of employing steam carriages as a means of transport for passengers on turnpike roads was fully established. The carriage remained at Stoney Stratford on Sunday, and was to have returned to town on Monday; but there being a meeting of magistrates and commis-

sioners of public works on that day, who expressed a desire of seeing the performance of the carriage, it was determined to delay the return till Tuesday, on which day it came to town, a distance of fifty-two miles, in four hours and forty-five minutes, even with the bad state of the roads.

"We have with pleasure spoken of the liberality of one party of individuals, we cannot pass over in silence the illiberality of others. Immediately on its being determined that the steam carriage should go to Birmingham, Mr. Macneill (one of the engineers of the Holyhead roads), assisted by Mr. Gordon, undertook to make arrangements for supplies of coke and water at proper distances; by this means it soon became generally known that the carriage was expected: and in addition to the already bad state of this portion of the roads (the St. Alban's trust), soft gravel to the depth of ten inches was laid over many parts, with a view to stop the carriage; but we leave this disgraceful conduct to receive its proper notice in the annual report to government of the commissioners and engineers of the roads. With the exception of this trust, the most liberal feeling was displayed by all parties and every facility afforded."

One of the principal roads having thus been taken up, and countenanced by some of our most celebrated engineers, leaves no doubt that attention will soon be called to other roads. An important benefit attending improving the present roads is, that the course of the traffic will remain unaltered; and thus the immense interests embraced on the "road sides," throughout the country, will retain and perhaps increase their value.

The subject of road making becoming thus a matter of the greatest importance, we hope to be able to give some particulars of the improvements which have been judiciously made on the Holyhead road; and we shall be happy to receive any information on this subject from our correspondents; for we are anxious to see every possible improvement introduced in our means of conveyance, whether on canals, railways, or common roads; we are advocates for all, for each means has its advantages; and we do not hesitate to say, that England is as much indebted for her prosperity to the facility of conveying her produce, as to any part of her economy.

Since writing the above, we have been favored with a copy of the report of the engineers who accompanied the carriage, which we subjoin.

Report of the Result of an Experimental Journey upon the Mail-Coach Line of the Holyhead Road, in Lieutenant Colonel Sir Charles Dance's Steam Carriage, on the 1st November, 1833.

Public attention having been attracted to the practicability of travelling with locomotive engines upon ordinary turnpike roads, by a report of a Committee of the House of Commons, of the 12th of October, 1831, stating that, in the opinion of the committee, the practicability of such mode of travelling had been fully established; and more recently by a report of a journey to and from Brighton having been successfully performed by Lieutenant Colonel Sir Charles Dance's steam carriage, as well as by the fact that the same carriage was daily in use between London and Greenwich, conveying numerous passengers through the crowded sub-

urbs of the metropolis without the slightest inconvenience to the public, we were desirous of personally making an experiment of the facility with which a carriage of that description could perform a journey of considerable length; and having selected the mail coach line of the Holyhead road for the purpose of such experiment, we made an arrangement with Sir Charles Dance for the use of his Carriage, on Friday, the 1st inst.

*The weight of the carriage, with the water, coke, and three persons upon it, was about - - - 3 tons, 5 cwt.

The weight of the omnibus coach attached to it - - - 1 " 0 "

The weight of the passengers, their luggage, and some additional sacks of coke, about 1 " 15 "

Making the gross weight moved, 6 tons, 0 cwt.

The motive power was an engine with two cylinders, seven inches in diameter and sixteen inches stroke. The pressure of steam on the tubes constituting the boiler, or generator, was not allowed to exceed 100 lbs. per square inch.

Before the carriage had proceeded six miles, one of the tubes of which Sir Charles Dance's boiler is composed was found to leak so fast as to render repair absolutely necessary: it was also apparent, that the size of the engine was not sufficient to carry so great a weight along a heavy road at any high velocity.

The weather was by no means favorable, there having been much rain in the course of the night and morning, so as to make the road heavy, added to which the winter coating of new materials had, in many places, been laid upon the road. Notwithstanding these obstacles, upon our arrival at Stoney Stratford, 52½ miles from town, it was found by Messrs. Macneill and Carpmael, who had taken accurate minutes of the loss of time occasioned by stoppages, that the average rate of travelling had been seven miles per hour.

Thus there can be no doubt, that with a well constructed engine of greater power, a steam carriage conveyance between London and Birmingham, at a velocity unattainable by horses, and limited only by safety, might be maintained; and it is our conviction that such a project might be undertaken with great advantage to the public, more particularly if, as might obviously be the case, without interfering with the general use of the road, a portion of it were to be prepared and kept in a state most suitable for travelling in locomotive steam carriages.

THOMAS TELFORD, President of the Society of Civil Engineers.

WM. CARPMAEL, Civil Engineer.

J. SIMPSON, Engineer to the Chelsea Water-Works.

London, November, 1833.

* These facts have been ascertained by Mr. Joshua Field, Mr. John Macneill, and Mr. Alexander Gordon, civil engineers.

Rochester, Feb. 28, 1834.

To the Editor of the Railroad Journal:

Sir,—Agreeably to your request, I forward the estimated expense of construction of the wood work on the plan suggested in my communication.

Reported expense to the directors of the Buffalo and Black Rock Railroad Company:

40560 feet, lineal measure, of round	
timber hewed on one side, at 2½ cts.	\$264 00
36960 feet of plank, \$12 per M.	443 52
7040 feet oak scantling, 2 by 4 inch, \$7, 49 28	
2640 lbs. spike, 8 in. (4 to the lb.) 8½ cts.	224 40
16 tons iron, 2 in. by ½ an in. \$55,	880 00
Additional security at the end by	
sills and iron, distribution of materials, accidentals, &c.	100 00
Labor in putting down road, (sills placed in the grade by the contractor for grading.)	84 00

Expense per mile, \$2045 20

The estimated cost of the construction of the Tonawanda railroad from Rochester to Attica, 43 miles, on this plan, with sills 12 inches in diameter, plank 2½ inches thick, 20 tons of iron per mile, spike 3 to the pound, as reported to the directors, is, per mile, \$2544 63.

The principal saving in the expense is in the grading. Where the surface conforms nearly to the level of the road, the line is cleared, the sills placed in their proper position, and ample ditches cut to form the grade. More than half of the distance of the Tonawanda railroad line is of this description, and can be prepared at a small expense per mile, in consequence of the change in the form of the wood work.

I have made arrangements for putting down with lime, in April, one mile on the Buffalo road, to be done in the following form, viz.: using 2½ bushels of stone lime per rod, 1½ bushels stacked and placed on the sills and over the surface of the grade before putting down the plank; one bushel made into grout and applied to the surface of the planking when the road is completed, covering the surface and filling the joints of the timber, and then covered with sand: Requiring 800 bushels per mile, at 10 cents, \$80 00

Labor 20 00

Expense per mile, \$100 00

You have anticipated on this form of road the use of common carriages. This manner of using the road was submitted to the commissioners of Tonawanda railroad in November last, with a view principally of using the first twenty miles from Rochester for market teams, allowing them to enter the road at certain hours in the forenoon, and afternoon to return, and so arranged as to not interfere with trains of cars; which would require the track to be five feet wide, in place of four feet nine inches, the usual width, which would not be materially objectionable. This question must be decided by experiment and circumstances.

I am, respectfully, yours,

ELISHA JOHNSON, Civil Engineer.

AMERICAN PATENTS IN ENGLAND.—The following extract of a letter from a gentleman in England, to his friend in this country, may be useful to those who desire to take out patents in Europe.

Extract of a letter from London, dated 14th December, 1833.

"It may be of use to apprise inventors of mechanical improvements in the United States, that it is essential to the security of their interests, if they design to take out patents for their inventions in this country, not to disclose the secret of their inventions in the United States until they have secured a patent here. There are many ingenious mechanics in the United States, in correspondence with their friends in this country, constantly upon the watch to seize any thing new and likely to be

useful, and to transmit the particulars to their friends, and thus forestal the rights and interest of the original inventor."

On the Causes of Spontaneous Combustion.

By J. A. B. [From the Journal of the Franklin Institute.]

I wish, through the medium of your Journal, to solicit the attention of some of your scientific readers to the causes of spontaneous combustion, generally; and with a view particularly to the investigation of those causes that are liable to produce it in cotton, woollen, and paper factories, from the stock, or waste, being accidentally impregnated with oils, or other substances.

As very few manufacturers are sufficiently acquainted with chemistry to determine accurately the causes of the effects which they may observe, it is therefore desirable that men of science, who have leisure, inclination, and information, (our correspondent has forgotten an important item, viz. means,) adequate to the task, should undertake and perform a series of experiments on the intermixture, or chemical combination, of different materials, together with the proportions, situations, degrees of heat, &c., requisite, in each case, to produce spontaneous combustion, and that publicity should be given to the same through the pages of this Journal.

The vast amount of capital invested in various kinds of manufactures, and the large number of mechanics and workmen of every grade and description, who are interested, either directly or indirectly, in the safety and prosperity of our factories, whose daily support and almost sole means of accumulating property are derived from their employment therein, all unite in the requisition.

It is confidently believed that many buildings have been destroyed by fire, originating in spontaneous combustion, and that there is frequently great danger, where it is least suspected.

To aid in the inquiry, agents and superintendents, as well as the observers in the several departments of factories, should unite in communicating such cases as may have come within their notice, together with such facts and circumstances as attended them.

To contribute my mite, I will give an account of the few instances that are within my knowledge, although my statements cannot be as detailed as I could wish, from my not having paid much attention to the subject at the time the observations were made.

The first instance of spontaneous combustion, or that which was apparently so, and was not otherwise accounted for, was in a quantity of wood ashes.

The ashes were in the body of an old waggon, with boards above, at the sides and ends, and had been accumulating for more than two years, to the amount of fifty bushels, or more. The ashes belonged to a very careful man, if the epithet is not altogether inapplicable to a person who would deposit ashes in a wooden vessel, whose constant custom was to have his ashes taken up from the hearth in a metallic vessel, and stand therein until entirely cold, before they were put into the usual place of deposit, and no danger was apprehended from this practice.

One evening about sunset, smoke was perceived to issue from the body of ashes, and it was first supposed that one of the domestics had, contrary to strict orders, put in some hot embers; but, on inquiry, it did not

appear that any ashes had been added for three days, and this appeared the more probable, as several vessels were then found standing full of ashes which had been taken up.

When the fire was discovered, it was expected that it was confined to a small spot only, and that a small quantity of water would be sufficient to extinguish it, but, on pouring water on the mass, the ashes were scattered very extensively, and on further examination it was found that the boards in several places were burnt almost through, and that the whole quantity of ashes was in a state of ignition like embers immediately from the fire. Nothing but a timely discovery prevented the destruction of a large portion of a village, for the buildings were all of wood, and so situated that the chance of saving one out of twenty would have been but very small.

I should be glad to throw some further light on this subject, but every thing else in relation to it was mere conjecture, and whether some oily substance was accidentally intermixed with the ashes, or was introduced by carelessness, or otherwise, or from what cause the combustion was produced, remains entirely unknown.

Instances have been known in which cotton has taken fire by wiping up with it oil that had been spilled, both linseed and sperm oil.

Weavers' harnesses in factories are varnished with a varnish made of the following materials, the same, in greater or less proportions, being used by different manufacturers: the usual ingredients are, linseed oil, spirits of turpentine, litharge, red lead, shellac, umber and India rubber. The composition is boiled down to a thick varnish, or laid on to the harness with a brush. The harness is usually made of cotton twine.

I once knew an instance in which a hank of twine, which was varnished for mending harness, took fire, spontaneously, while hanging to dry.

I mention this circumstance, because in many factories it is customary to varnish and hang the new harness to dry in the garret, or some other spare room of the mill, and likewise to lay away the old worn-out harness in the same place, and with very little caution as to the quantity that comes in contact: a practice that may lead to dangerous and destructive consequences.

I hope my remarks will not be considered irrelevant. It will readily be perceived that my object is, at this time, more to obtain than to communicate useful information.

Pittsfield, N. H., December 2, 1833.

PRESERVATION OF SUBSTANCES BY MEANS OF ALKALIS.—M. Pryn has preserved, during many months, polished instruments of iron and steel, by keeping them in solutions of potash and soda,—saturated solutions diluted with one, two, or three times their weight of water. He at first thought that the preserving power depended upon the disappearance of the air, and the carbonic acid in the alkaline mixture, but he afterwards concluded that alkalinity acted an essential part in the phenomenon. In fact, a very small quantity of alkali is sufficient; thus, 2000 and even 3000 of caustic potash in water will preserve from oxidation bars of iron, &c. immersed in it. Lime water, diluted with its own weight of water, or of course without dilution, answers the same purpose. Alkaline carbonates and borax have the same effect, but they must necessarily be stronger.—[Revue Encyclopedique.]

Animal Mechanics, or Proofs of Design in the Animal Frame. Continued from page 120. [From the Library of Useful Knowledge.]

The human spine rests on what is called the *pelvis*, or basin: a circle of bones, of which the haunches are the extreme lateral parts; and the sacrum, (which is as the key-stone of the arch) may be felt at the lower part of the back. To this central bone of the arch of the pelvis, the spine is connected; and, taking the similitude of the mast, the sacrum is the *step* on which the base of the pillar, like the heel of the mast, is socketed or morticed. The spine is tied to the lateral parts of the pelvis by powerful ligaments, which may be compared to the shrouds. They secure the lower part of the spine against the shock of lateral motion or rolling; but instead of the stays, to limit the play of the spine forwards and backwards in pitching, or to adjust the rake of the mast, there is a very beautiful contrivance in the lower part of the column.

The spine forms here a semi-circle, which has this effect: that, whether by the exertion of the lower extremities, the spine is to be carried forward upon the pelvis, or whether the body stops suddenly in running, the jar which would necessarily take place at the lower part of the spine, A, if it stood upright like a mast, is distributed over several of the bones of the spine, 1, 2, 3, 4, and, therefore, the chance of injury at any particular part is diminished.

Fig. 6.

For example, the sacrum, or centre bone of the pelvis, being carried forward, as when one is about to run, the force is communicated to the lowest bone of the spine. But then the surfaces of these bones stand with a very slight degree of obliquity to the line of motion; the shock communicated from the lower to the second bone of the vertebrae is still in a direction very nearly perpendicular to its surface of contact. The same takes place in the communication of force from the second to the third, and from the third to the fourth; so that before the shock of the horizontal motion acts upon the perpendicular spine, it is distributed over four bones of that column, instead of the whole force being concentrated upon the joinings of any two, as at A.

If the column stood upright, as indicated at C D, it would be jarred at the lowest point of contact with its base. But by forming a semi-circle A B, the motion which, in the direction E F, would produce a jar on the very lowest part of the column, is distribu-

ted over a considerable portion of the column A B; and, in point of fact, this part of the spine never gives way. Indeed, we should be inclined to offer this mode to the consideration of nautical men, as fruitful in hints for improving naval architecture.

Every one who has seen a ship pitching in a heavy sea, must have asked himself why the masts are not upright, or rather why the foremast stands upright, whilst the main and mizen masts stand oblique to the deck, or, as the phrase is, rake aft, or towards the stern of the ship.

The main and mizen masts incline backwards, because the strain is greatest in the forward pitch of the vessel; for the mast having received an impulse forwards, it is suddenly checked as the head of the ship rises; but the mast being set with an inclination backwards, the motion falls more in the perpendicular line from the head to the heel. This advantage is lost in the upright position of the foremast, but it is sacrificed to a superior advantage gained in working the ship; the sails upon this mast act more powerfully in swaying the vessel round, and the perpendicular position causes the ship to tack or stay better; but the perpendicular position, as we have seen, causes the strain in pitching to come at right angles to the mast, and is, therefore, more apt to spring it.

These considerations give an interest to the fact that the human spine, from its utmost convexity near its base, inclines backwards.

CHAPTER III.

OF THE CHEST.—In extending the parallel which we proposed between the structure of the body and the works of human art, it signifies very little to what part we turn; for the happy adaptation of means to the end will every where challenge our admiration, in exact proportion to our success in comprehending the provisions which Supreme Wisdom has made. We turn now to a short view of the bones of the chest.

The thorax, or chest, is composed of bones and cartilages, so disposed as to sustain and protect the most vital parts, the heart and lungs, and to turn and twist with perfect facility in every motion of the body; and to be in incessant motion in the act of respiration, without a moment's interval during a whole life. In anatomical description, the thorax is formed of the vertebral column, or spine, on the back part, the ribs on either side, and the breast bone, or sternum, on the fore part. But the thing most to be admired is the manner in which these bones are united, and especially the manner in which the ribs are joined to the breast bone, by the interposition of cartilages or gristle, of a substance softer than bone, and more elastic and yielding. By this quality they are fitted for protecting the chest against the effects of violence, and even for sustaining life after the muscular power of respiration has become too feeble to continue without this support.

If the ribs were complete circles, formed of bone, and extending from the spine to the breast bone, life would be endangered by any accidental fracture; and even the rubs and jolts to which the human frame is continually exposed, would be too much for their delicate and brittle texture. But these evils are avoided by the interposition of the elastic cartilage. On their fore part the ribs are eaked out, and joined to the breast bone

by means of cartilages, of a form corresponding to that of the ribs, being, as it were, a completion of the arch of the ribs, by a substance more adapted to yield in every shock or motion of the body. The elasticity of this portion subdues those shocks which would occasion the breaking of the ribs. We lean forward, or to one side, and the ribs accommodate themselves, not by a change of form in the bones, but by the bending or elasticity of the cartilages. A severe blow upon the ribs does not break them, because their extremities recoil and yield to the violence. It is only in youth, however, when the human frame is in perfection, that this pliancy and elasticity have full effect. When old age approaches, the cartilages of the ribs become bony. They attach themselves firmly to the breast bone, and the extremities of the ribs are fixed, as if the whole arch were formed of bone unyielding and inelastic. Then every violent blow upon the side is attended with fracture of the rib, an accident seldom occurring in childhood, or in youth.

But there is a purpose still more important to be accomplished by means of the elastic structure of the ribs, as partly formed of cartilage. This is in the action of breathing, or respiration; especially in the more highly-raised respiration which is necessary in great exertions of bodily strength, and in violent exercise. There are two acts of breathing—*expiration*, or the sending forth of the breath, and *inspiration*, or the drawing in of the breath. When the chest is at rest, it is neither in the state of expiration nor in that of inspiration; it is in an intermediate condition between these two acts. And the muscular effort by which either inspiration or expiration is produced, is an act in opposition to the elastic property of the ribs. The property of the ribs is to preserve the breast in the intermediate state between expiration and inspiration. The muscles of respiration are excited alternately, to dilate or to contract the cavity of the chest, and, in doing so, to raise or to depress the ribs. Hence it is, that both in inspiration and in expiration, the elasticity of the ribs is called into play; and, were it within our province, it would be easy to show that the dead power of the cartilages of the ribs preserve life by respiration, after the vital muscular power would, without such assistance, be too weak to continue life.

It will at once be understood, from what has now been explained, how, in age, violent exercise or exertion is under restraint, in so far as it depends on respiration. The elasticity of the cartilages is gone, the circle of the ribs is now unyielding and will not allow that high breathing, that sudden and great dilating and contracting of the cavity of the chest, which is required for circulating the blood through the lungs, and relieving the heart amidst the more tumultuous flowing of the blood which exercise and exertion produce.

CHAPTER IV.

DESIGN SHOWN IN THE STRUCTURE OF THE BONES AND JOINTS OF THE EXTREMITIES.—That the bones which form the interior of animal bodies should have the most perfect shape, combining strength and lightness, ought not to surprise us, when we find this in the lowest vegetable production.

In the sixteenth century, an unfortunate man who taught medicine, philosophy, and

theology, was accused of atheistical opinions, and condemned to have his tongue cut out, and to suffer death. When brought from his cell before the inquisition, he was asked if he believed in God. Picking up a straw which had stuck to his garments, "If," said he, "there was nothing else in Nature to teach me the existence of a Deity, even this straw would be sufficient?"

A reed, or a quill, or a bone, may be taken to prove that in Nature's works strength is given with the least possible expense of materials. The long bones of animals are, for the most part, hollow cylinders, filled up with the lightest substance, marrow; and in birds the object is attained by means (if we may be permitted to say so) still more artificially. Every one must have observed, that the breast bone of a fowl extends along the whole body, and that the body is very large compared with the weight; this is for the purpose of rendering the creature specifically lighter, and more buoyant in the air; and that it may have a surface for the attachment of muscles, equal to the exertion of raising it on the wing. This combination of lightness with increase of volume is gained by air cells extending through the body, and communicating by tubes between the lungs and cavities of the bones. By these means the bones, although large and strong, to withstand the operation of powerful muscles upon them, are much lighter than those of quadrupeds.

The long bones of the human body being hollow tubes, are called cylindrical, though they are not accurately so, the reason of which we shall presently explain; and we shall at the same time show that their irregularities are not accidental, as some have imagined. But let us first demonstrate the advantage which, in the structure of the bones, is derived from the cylindrical form, or a form approaching to that of the cylinder. If a piece of timber, supported on two points, thus—

Fig. 7.

bearing a weight upon it, it sustains this weight by different qualities in its different parts. For example, divide it into three equal parts (A, B, C); the upper part, A, supports the weight by its solidity and resistance to compression; the lowest part, B, on the other hand, resists by its toughness, or adhesive quality. Betwixt the portions acting in so different a manner, there is an intermediate neutral, or central part, C, that may be taken away without materially weakening the beam, which shows that a hollow cylinder is the form of strength. The writer lately observed a good demonstration of this: a large tree was blown down, and lay upon the ground; to the windward, the broken part gaped; it had been torn asunder like the snapping of a rope. To the leeward side of the tree, the fibres of the stem were crushed into one another and splintered, whilst the central part remained entire. This, we presume, must be always the case, more

or less; and here we take the opportunity of noticing why the arch is the form of strength. If this transverse piece of timber were in the form of an arch, and supported at the extremities, then its whole thickness, its centre, as well as the upper and lower parts, would support weight by resisting compression. But the demonstration may be carried much farther to show the form of strength in the bone. If the part of the cylinder which bears the pressure be made more dense, the power of resistance will be much increased; whereas, if a ligamentous covering be added on the other side, it will strengthen the part which resists extension, and we observe a provision of this kind in the tough ligaments which run along the vertebræ of the back.

When we see the bone cut across, we are forced to acknowledge that it is formed on the principle of the cylinder; that is, that the material is removed from the centre, and accumulated on the circumference, thus:

Fig. 8.

We find a spine or ridge running along the bone, which, when divided by the saw in a transverse direction, exhibits an irregularity, as at A.

The section of this spine shows a surface as dense as ivory, which is, therefore, much more capable of resisting compression than the other part of the cylinder, which is common bone. This declares what the spine is, and the anatomists must be wrong who imagine that the bone is moulded by the action of the muscle, and that the spine is a mere ridge, arising by accident among the muscles. It is, on the contrary, a strengthening of the bone in the direction on which the weight bears. If we resume the experiment with the piece of timber, we shall learn why the spine is harder than the rest of the bone. If a portion of the upper part of the timber be cut away, and a harder wood inserted in its place, the beam will acquire a new power of resisting fracture, because, as we have stated, this part of the wood does not yield, but by being crushed, and the insertion of the harder portion of wood increases this

Fig. 9.

property of resistance. With this fact before us, we may return to the examination of the spine of bone. We see that it is calculated to resist pressure: first, because it is farther removed from the centre of the cylinder, and, secondly, because it is denser, to resist compression, than the other part of the circumference of the bone.*

* As the line A B extends farther from the centre than B C, on the principle of a lever, the resistance to transverse fracture will be greater in the direction A B than B C.

This explanation of the use of a spine upon a bone gives a new interest to osteology.* The anatomists ought to deduce from the form of the spine the motions of the limb; the forces bearing upon the bone, and the nature and the common place of fracture; while, to the general inquirer, an agreeable process of reasoning is introduced in that department, which is altogether without interest when the "irregularities" of the bone are spoken of, as if they were the accidental consequences of the pressure of the flesh upon it.

Although treating of the purely mechanical principle, it is, perhaps, not far removed from our proper object to remark, that a person of feeble texture and indolent habits has the bone smooth, thin, and light; but that Nature, solicitous for our safety, in a manner which we could not anticipate, combines with the powerful muscular frame a dense and perfect texture of bone, where every spine and tubercle is completely developed. And thus the inert and mechanical provisions of the bone always bear relation to the muscular power of the limb, and exercise is as necessary to the perfect constitution of a bone as it is to the perfection of the muscular power. Jockies speak correctly enough when they use the term "blood and bone," as distinguishing the breed or gencalogy of horses; for blood is an allowable term for the race, and bone is so far significant, that the bone of a running horse is remarkably compact compared with the bone of a draught horse. The reader can easily understand that the span in the gallop must give a shock in proportion to its length; and, as in man, so in the horse, the greater the muscular power the denser and stronger is the bone.

The bone not being as a mere pillar, intended to bear a perpendicular weight, we ought not to expect uniformity in its shape. Each bone according to its place bears up against the varying forces that are applied to it.

* Osteology, from the Greek words, signifying discourse on bone, being the demonstration of the forms and connection of the different bones.

THE JACKSON COTTON GIN.—Mr. James Lynch, an ingenious mechanic of this place, has invented a new kind of Cotton Gin, to which he has given the above title. We should suppose from the name that it was intended to operate with a powerful impulse.

We have seen a model of the gin; but owing to the fact that we are not much acquainted with machinery of the kind, we are unable to speak with certainty of its advantages. It differs from the common gin in these respects: it contains three separate sets of cylindrical pickers, which are shorter and smaller than the common saw cylinder—and the teeth are finer. The arrangement of these pickers is one above another, the largest set being below, and presenting a front a little convex. The breast or ribs are of a peculiar form, not easily described, and wrought or cast of one piece of sheet metal. The seed cotton rolls in the hopper as in other gins, and is taken from all the pickers and thrown out at the flue, by one cylindrical brush. All the cylinders turn upon points, and are driven by two belts, passing over a drum in the rear of the machine.

The advantages of this gin are supposed to consist in its despatch; its requiring less power; occupying less space; being less

apt to cut or injure the staple; picking cleaner; being less liable to take fire from friction; and from its being less liable to choke and get out of repair, than those now in use.

Mr. Lynch intends going to Pittsburg shortly, with a view of procuring castings for this and other machinery. We wish him much success in the laudable enterprise.

AGRICULTURE, &c.

[From the New-York Farmer.]

SHORT HORN DURHAM AND DEVON CATTLE.—

A writer in the Genesee Farmer, under the signature of Ulmus, has collected the opinions of breeders on the comparative merits of these cattle, and given his in favor of the Durham, particularly for the heavy pastures of the West. He has omitted to state one objection to this breed. Butchers in New-York, and we believe generally, have prejudices against them. They think their meat is coarser and darker, and that the great depth or thickness of the flesh, unlined or unmarbled with fat, makes this beef more difficult to be cut up for retail with a suitable proportion of flesh and fat. If these objections are well founded, they should have consideration with those who are about to enter into this branch of husbandry. It should be recollected, too, that we have not, as in Great Britain, a large navy and army to consume our heavy beefs, but must depend on our large cities and towns for a market for fine beefs.

LIME SPREADING.—We last week had an opportunity of witnessing the performance of a machine for spreading lime invented by Mark Wilson, of this county, and by him patented. Although the machine was much worn, being one of the first constructed, it spread near a hundred bushels in an afternoon. It is quite simple, and could be made, with the exception of the cog-wheels, by any one accustomed to the use of the saw and hatchet. It spreads the lime in any proportion desired, from 10 to 70 bushels to the acre, and with more uniformity than can be done with a shovel. The machines are made for one or two horses, and it is ascertained that two men can spread, with a two-horse machine, four hundred bushels per day. It can be used in windy as well as in calm weather, no inconvenience arising from the dust therefrom.

We conceive it to be an improvement of much consequence to farmers, who make use of lime as manure, entirely doing away a most disagreeable yet necessary branch of their business. The machines, for two horses, cost about 30 or 35 dollars, and as no one farmer could have constant use for them, by three or four joining together, the expense would be so trifling that we should presume every neighborhood would be able to have among them one of these labor-saving machines.—[Bucks Co. Intell.]

ON THE CULTURE OF THE GARDEN BEAN.—

I have been very successful for half-a-dozen years in obtaining two crops of beans from the same plants. In the summer of 1826, my first crop of magazan and early long-pod beans was, by a very strong and violent wind, blown down; this was done when the beans were in full blossom. The crop from the blossoms which the plants then possessed was very fine and abundant, and gathered during July. In three weeks after the beans were prostrated, each stem pushed forth from near the root one or more, in some instances four to six fresh stems; these bloomed freely and produced an abundant crop, which was gathered during September. Since that grew, I have uniformly bent down, so as to break the stalk near the root, my first and se-

cond crops of beans; I have by this means obtained four crops of beans from two sowings, and which supplied me from July 1st to 31st October. By this method only half the seed was required which I had been accustomed to use, and the greatest advantage to me was that only half the ground was required, so that my advantages by this method are fourfold. I always pinch out the tops when the plants are in full bloom; this throws the vigor into the production of fruit instead of a continued increase of stem and foliage.—[Mr. James Falkland, Pentonville, in the Gardener's and Forester's Record, No. 3.]

ON BREEDING HORSES.—[By T. A. KNIGHT, Esq. of Downton, Herefordshire.]—Having introduced, for the use of my tenants, a high priced stallion, of the breed of the large London dray horse, I wish to state to agriculturists the grounds upon which I anticipate much advantage from the introduction of so large an animal. He will, I have reason to believe, be, when full grown, not less than seventeen hands high, and very compact in form.

I conceive myself to have proved, by many experiments, of a part of which an account was published some years ago in the Philosophical Transactions, that the length of the legs of the offspring of all those animals which nature has intended to accompany their parents in flight, at an early age, is governed wholly by the habits of the female parent. This tribe of animals comprehends the horse, the cow, the sheep, and deer, and many others. If the female parent be of low stature, and descended from a breed of a similar form and size, the length of the legs of the offspring will be short, and will not be increased in length, though they will in strength, by any influence of its male parent, however tall and large that may have been; and the converse of this proposition will be found to be equally true.

The experience of almost every farmer must have taught him that horses with drop shoulders and bodies, and capacious chests, are more capable of bearing hard and long-continued labor than those of which the shoulders, and of course the chests, are shallow, and the legs long; but comparatively few know how rapidly the powers of draught of any animal mechanically decrease with the increasing length of the legs, comparatively with the depth of the shoulders and body. If a horse, proportioned as English horses now generally are, be sixteen hands high, his fore legs, measured from the elbow joint, will be about three feet, or nine hands high, and his shoulder about two feet four inches, or seven hands high. If such a horse be able to raise, by means of a cord passed over a pulley, a weight of a thousand pounds, another horse similar to that in every other respect, except that of having its legs eight inches shorter, would, on account of the mechanical advantage of its form, be able to raise twelve hundred and fifty pounds, or one-fourth more, with considerably less exertion; for his power would increase with the diminished length of his legs, nearly in the same proportion as the power of the weight upon the longer arms of the steelyards is increased by being made to recede from the point of suspension; and if the length of the leg of such horse, comparatively with the depth of the shoulder, were further diminished, its power would increase in an accumulating ratio. The enormous strength of a bull of mature age affords familiar evidence of the truth of these positions; and I doubt much whether the offspring of a Norwegian pony, and a strong and low draught mare, would not be found capable of drawing a heavier weight up hill, to any considerable distance, than the largest horse of the ordinary form and proportion; whilst it would not, probably, exceed two-thirds of its weight, nor require more than two-thirds the quantity of food; and it would possess much more activity, and be much less subject to accidents. And I have good reason to believe that more perfect animals, for supplying mankind with food, may generally be obtained by cross-breeding from

females of small, and male animals of large size, than from any breed of fixed and permanent habits, relatively to size.—[Farmer's Magazine.]

CALVES.—The following method of managing calves strikes us as being correct, particularly when the cow gives an abundance of milk. When the supply is small, we should suppose the calf would require additional food besides the milk.

"A friend of ours," says the Genesee Farmer, "has been very successful for many years in producing veal of the finest quality, by the following method: During the first fortnight, the calf is allowed one-half the milk, three-quarters during the third week, and the whole during the fourth week. This is his rule for common cows. In extraordinary cases, he allows more or less, according to circumstances; but deems it of great importance that the calf should be full fed during the last week."

"The reason which is given for this practice is, that if the calf takes all the milk at first, it will grow fast, and soon become too large for its supply of nourishment; but if it be stinted at first, its mother's milk will be commonly sufficient to fatten it at the close of the month."

FEEDING LIVE STOCK IN WINTER.—There is perhaps nothing relating to rural economy in which farmers differ more, both in theory and practice, than in feeding their cattle in the winter season. We speak not now of the different kinds of fodder, or of their comparative value in the feeding of stock, but merely of the manner and frequency with which the cattle are fed.

Many farmers believe it indispensable, both as to the good condition of their stock and the greatest economy of fodder, to feed them five times, at least, each day, during the winter; while others practise feeding but three or four times in a day; and again, others but twice.

Experiment alone can prove which of these modes of feeding will carry stock through the winter in the highest order, and with the least expense of fodder. Our own experience, on the subject, is decidedly in favor of feeding but twice in a day. More than twenty years' observation and experience in the keeping of stock, in a climate where, on an average, dry fodder is required to be given more than seven months in the year, has given us an opportunity to test the value of the several modes of feeding above mentioned. We were first induced to try the experiment of feeding twice in a day only, from information communicated to us by a very intelligent and successful farmer, in a neighboring town. He said he had, a few years before, had occasion to call on a farmer's widow to aid in the appraisal of several cows, and found them near the end of the winter in such high order as to draw his particular attention.

He inquired of the widow, particularly, the manner in which they had been kept, and found she had given them nothing but hay, through the winter; and that in consequence of having no man or boy to attend her stock, she had been obliged to do it herself; and being in rather feeble health, she had never fed them but twice a day. This led him to examine particularly as to the kind and quality of the hay with which the cows had been fed. He found the hay not so good as his own, while the cows were in much higher order than his; though his had been fed five times a day through the winter.

From a knowledge of these facts, he afterward adopted the same mode of feeding, giving his cattle just so much twice in each day, as they would eat up perfectly clean, and no more; and has since found it, by experience, both a saving of fodder and a benefit to his stock. From this information we adopted the practice of feeding but twice in a day, something more than ten years ago, and have found, or think we have found, the same favorable results.—[Northern Farmer.]

NEW-YORK AMERICAN.

MARCH 1-7, 1834.

LITERARY NOTICES.

No. XVII.

Dorr Prairie. (Indiana,) Dec. 29, 1833.

Being now on the mail route between Detroit and Chicago, I am travelling very comfortably in a four-horse wagon, with the gentleman mentioned in my last. I found my horse's back so sore at White Pigeon, that it was unpleasant to use him longer under the saddle; and having met with my trunk at Niles, which was forwarded from Monroe by a friend, I am in a measure compelled to adopt what is certainly the most agreeable mode of travelling at this season through a bleak prairie country.

The cold winter moon was still riding high in the heavens, as we ferried over the St. Josephs at Niles this morning. A low-sided scow was the means of conveyance; and after breaking the solid ice near the shore, to loose us from our moorings, it required some pains to shun the detached cakes, which came driving down the centre of the dark rolling river, which, near the opposite shore, had become so wedged and frozen together, that it required considerable exertion to break a way with our long poles, and make good our landing. At length, ascending the bank, a beautiful plain, with a clump of trees here and there upon its surface, opened to our view. The establishment of the Casey Mission, a long, low, white building, could be distinguished afar off, faintly gleaming in the moonlight, while several lodges of the Pottawattamies, three or four hundred of which tribe inhabit this fine district, were plainly perceptible over the plain. The moon, indeed, shone with an effulgence such as I have never witnessed, except beneath the pearly skies of the West. Morning came at last, still, but excessively cold, our horses' manes and our own clothes being covered with hoar-frost, while each blade of grass that shot its wilted spear above the snow, glistened like a diamond's point beneath the uprising sun.

About 10 o'clock, we reached a shantee on Terre Coupee prairie, and finding only a boy of six years old at home, rummaged the whole establishment to find the materials for a breakfast, which we cooked ourselves. Our next stage carried us over a rolling prairie to Laporte. The undulating surface resembled the ground swell of the sea, and nothing could be more dreary at this season when the bright sky of the morning became overcast, than moving mile after mile over this frozen lake—for such it appeared—with nothing but its monstrous swell to catch the eye, wherever its glances roamed.

It was afternoon when we reached the little settlement of Laporte, which is situated on a pretty lake in a prairie of the same name, the skirts of which are beautifully timbered. There was just light enough remaining when we reached our present stopping place, a comfortable log cabin, to see the opening ahead through the timber from which this prairie takes its name. It forms a door opening upon an area of the Grand Prairie which runs through the States of Michigan and Illinois, and extends afterwards, if I mistake not, to the base of the Rocky Mountains. I am now in the land of the Hoosers, and find that long-haired race much more civilized than some of their Western neighbors are willing to represent them. The term "Hoosher," like that of Yankee, or Tuckahoe, first applied contemptuously, has now become a sort of national epithet, by which the inhabitants of this fine State are proud to be distinguished. This part of the State is as yet but thinly settled, but the land is now rapidly coming into market; and it is calculated to support a dense population. A new town and harbor called "Michigan City," about 30 miles off, on the shore of the Lake, is fast coming into notice, and giving a spur to the settlement in these parts. The

country is, however, still wild enough, and I have a wilder yet to pass, before reaching Chicago.

Chicago, Jun. 1, 1834.

We left the prairie on the east, after passing through the door, and entered a forest, where the enormous black walnut and sycamore trees cumbered the soil with trunks, from which a comfortable dwelling might be excavated. The road was about as bad as could be imagined; and, after riding so long over prairies as smooth as a turnpike, the stumps and fallen trees over which we were compelled to drive, with the deep mud-holes into which our horses continually plunged, were anything but agreeable. Still, the stupendous vegetation of the forest interested me sufficiently to make the time, otherwise enlivened by good company, pass with sufficient fleetness, though we made hardly more than two miles an hour, throughout the stage. At last, after passing several untenanted sugar camps of the Indians, who, of course, were elsewhere at this season, we reached a cabin prettily situated on the banks of a lively brook, winding through the forest. A little Frenchman waited at the door to receive our horses, while a couple of half intoxicated Indians followed us into the house, in the hope of getting *a'netos* (vulgarily a treat) from the newcomers. The usual settlers' dinner of fried bacon, venison cutlets, hot cakes, and wild honey, with some tolerable tea and Indian sugar, as that made from the maple tree is called at the West, was soon placed before us, while our new driver, the frizzly little Frenchman, already mentioned, harnessed a fresh team, and hurried us into the wagon, as soon as possible. The poor little fellow had 30 miles to drive before dark, on the most difficult part of the route of the line between Detroit and Chicago. It was easy to see that he knew nothing of driving; the moment he took his reins in hand; but when one of my fellow-travellers mentioned that little Victor had been preferred to his present situation of trust from the indefatigable manner in which, before the stage route was established last season, he had for years carried the mail through this lonely country—swimming rivers and sleeping in the woods at all seasons,—it was impossible to dash the mixture of boyish glee and official pomposity with which he entered upon his duties, by suggesting any improvement as to the mode of performing them. Away then we went helter skelter through the woods—scrambled through a brook, and galloping over an arm of the prairie, struck again into the forest. A fine stream, called the Calamine, made our progress here more gentle for a moment.—But immediately on the other side of the river was an Indian trading post, and our little French Phaeton, who, to tell the truth, had been repressing his fire for the last half hour, while winding among the decayed trees and broken branches of the forest, could contain no longer. He shook the reins on his wheel horses, and cracked up his leaders with an air that would have distinguished him on the Third Avenue, and been envied at Cato's. He rises in his seat as he passes the trading house; he sweeps by like a whirlwind; but a female peeps from the portal, and it is all over with poor Victor. That backward glance which he now casts behind to see the impression he has made upon the fair, is fatal to his triumph. The infuriate car strikes a stump, and the unlucky youth shoots off at a tangent, as if he were discharged from a mortar. The whole operation was completed with such velocity, that the first intimation I had of what was going forward was on finding myself two or three yards from the shattered wagon, with a tall Indian in a wolfskin cap standing over me.—My two fellow passengers were dislodged from their seats with the same want of ceremony; but though the *disjecta membra* of our company were thus prodigally scattered about, none of us providentially received injury. Poor Victor was terribly crest fallen; and had he not

unpacked his soul by calling upon all the saints in the calendar in a manner more familiar than respectful, I verily believe that his tight little person would have exploded like a torpedo.—A very respectable looking Indian female, the wife probably of the French gentleman who owned the post, came out and politely furnished us with basins and towels to clean our hands and faces, which were sorely bespattered with mud, while the grey old Indian before mentioned assisted in collecting our scattered baggage. The spot where our disaster occurred was a sequestered, wild-looking place. The trading establishment, consisted of 6 or 8 log cabins of a most primitive construction, all of them grey with age, and so grouped on the bank of the river as to present an appearance quite picturesque. There was not much time, however, to be spent in observing its beauties. The sun was low, and we had 29 miles yet to travel that night before reaching the only shantee on the lake shore. My companions were compelled to mount two of the stage horses, whilst I once more put my saddle on mine, and leaving our trunks to follow a week hence, we slung our saddle bags across the cruppers and pushed directly ahead. A few miles easy riding through the woods brought us to a dangerous morass, where we were compelled to dismount and drive our horses across, one of the party going in advance to catch them on the other side. A mile or two of pine barrens now lay between us and the shore, and winding rapidly among the short hills covered with this stunted growth, we came suddenly upon a mound of white sand at least fifty feet high. Another of these desolate looking eminences, still higher, lay beyond. We topped it; and there, far away before us, lay the broad bosom of Lake Michigan—the red disk of the sun just sinking beneath it, and the freshening night-breeze beginning to curl its limpid waters on the shore; and now having gained their verge, whichever way we turned, there was nothing discernible but the blackening lake one side and these conical hills of shifting white sand on the other. Some of them, as the night advanced and objects were only discernible by the bright starlight, assumed a most fantastic appearance, and made me regret that I could not visit the "Sleeping Bear" and other singularly formed mounds which many miles farther to the north, swell from two to three hundred feet above the level of the lake. The deep sand into which our horses sunk to the fetlocks was at first most wearisome to the poor beasts, and having twenty miles yet to travel entirely on the lake shore, we were compelled, in spite of the danger of quicksands, to move as near the water as possible. But though the day had been mild, the night rapidly became so cold that, before we had proceeded thus many miles, the beach 20 yards from the surf was nearly as hard as stone, and the finest McAdamized road in the world could not compare with the one over which we now galloped. Nor did we want lamps to guide us on our way. Above, the stars stood out like points of light, while the resplendent fires of the Aurora Borealis shooting along the heavens on our right, were mocked by the livid glare of the Kankakee marshes burning behind the sand hills on our left. The lake alone looked dark and lowering; though even its gathering waves would smile when touched with light as they broke upon the shore. The intense cold seemed to invigorate our horses; and dashing the fire from the occasional pebbles, they clattered along the frozen beach at a rate that brought us rapidly to our destination for the night. It was a rude cabin, built of the trunks of the stunted pines around, standing behind a sandy swell about two hundred yards from the shore. My fingers were numb with cold; and seeing a rough looking fellow moving from the door towards the horses of my companions, I requested him to take mine also; but upon his politely rejoining that "he was nobody's hostler but his own" I could only wish him a more civil master, and proceeded to take care of the

animal myself. A brake of stunted evergreens, near by, supplied the place of a stable; and passing a whisp of dry grass over the reeking limbs of my four-footed friend, I flung my cloak over his back and tethered him for the night. The keeper of the rustic hostelry came up just as I got through with this necessary task, and explaining to me that the insolent loungeur was a discharged stage driver, returned with me to the house for a measure of corn; while I, guided by the light flickering through the crevices of his frail dwelling rejoined my companions nestled with two other half-frozen travelers around the grateful fire within. The strangers were both western men; one the brother of a distinguished poet in New York, for sometimes settled in Illinois; and the other an Indian trader of long standing in Chicago. Warlike incidents in border story and the pacific dealings between the whites and Indians, formed the chief subjects of conversation, which soon became general, and was prolonged to a late hour: finally the late treaty held at Chicago—at which, as you have probably seen in the newspapers, several thousand Indians were present—was discussed, and the anecdotes that were told of meanness, rapacity, and highway robbery, (in cheating, stealing, and forcibly taking away) from the Indians, exasperated me so that I expressed my indignation and contempt in unmeasured terms. The worthy trader, who was a middle aged man, of affable, quiet good manners, seemed to sympathize with me throughout; but the whole current of my feelings was totally changed; when, upon my observing shortly afterwards to another gentlemen that "I should have liked to have been at Chicago a year ago," my warm coadjutor ejaculated from under the blanket where he had in the meantime bestowed himself—"ah, sir, if you had, the way in which you'd have hooked an Indian blanket by this time would be curious." The chivalric knight of La Mancha, himself, could not have sustained heroics under such a home thrust, but must have burst into the hearty laugh in which I was joined by all present. The hour of sleep for all at last arrived, and a couple of wooden bunks, swung from the roof, falling to the lot of those who had come in first, I wrapped myself in a buffalo skin and placing my saddle under my head for a pillow, soon "slept like a king;" a term, which, if

"Uneasy lies the head that wears a crown," be true doctrine, is, probably, *quasi lucus* &c.

Our transient acquaintances parted from us in a most friendly manner in the morning; and after waiting in vain till near noon to see if by any chance little Victor might not be able to forward our trunks, to this point, we mounted once more, and pushed ahead with all speed to accomplish the remaining 20 or 30 miles between the shantee and Chicago. Our route was still along the shore; and after passing around the end of the lake and taking a northwardly direction, the way in which the ice would come down the bleak shore of the lake "was curious." We galloped at full speed, every man choosing his own route for himself along the beach, our horse's hoofs ringing the while as if it were a pavement of flint beneath them. The rough ice piled up on the coast prevented us from watering our beasts; and we did not draw a rein till the rushing current of the Calumine, which debouches into Lake Michigan some 10 miles from Chicago, stayed our course. A cabin on the bank gave us a moment's opportunity to warm, and then being ferried over the wintry stream, we started with fresh vigor, and crossing about a mile of prairie in the neighborhood of Chicago, reached here in time for an early dinner. Our horses this morning seem none the worse for this furious riding, their escape from ill consequences being readily attributable to the excellence of the road and the extreme coolness of the weather while travelling it. For my own part, I never felt better than after this violent burst of exercise. We had

not been here an hour before an invitation to a public ball was courteously sent to us by the managers; and though my soiled and travel-worn riding dress was not exactly the thing to present one's self in before ladies of an evening, in my earnestness to see life on the frontier, I easily allowed all objections to be overruled by my companions, and we accordingly drove to the house in which the ball was given. It was a frame building, one of the few as yet to be found in Chicago, which, although one of the most ancient French trading posts on the lakes, can only date its growth as a village since the Indian war 18 months since. When I add that the population has *quintupled* last summer, and that but few mechanics have come in with the prodigious increase of residents, you can readily imagine that the influx of strangers far exceeds the means of accommodation, while scarcely a house in the place, however comfortable looking outside, contains more than two or three finished rooms. In the present instance, we were ushered into a tolerably sized dancing-room, situated over a lath and plastered parlor and bar-room, and having its once green walls so ingeniously covered with pine branches and flags borrowed from the garrison, that with the finished ceiling above, it presented a very complete and quite pretty appearance. It was not so warm, however, that the fires of cheerful hickory which roared at either end could have been readily dispensed with. An orchestra of unplained boards was raised against the wall, in the centre of the room, the band consisting of a tall dandy negro, with his violin, a fine military-looking bass drummer from the fort, and a volunteer citizen, who alternately played an accompaniment upon the flute and triangle. Blackee, who flourished about with a great many airs and graces, was decidedly the king of the company, and it was amusing, while his head followed the direction of his fiddle bow with pertinacious fidelity, to see the Captain Manuel-like precision with which the soldier dressed to the front on one side, and the nonchalant air of importance which the cit attempted to preserve on the other. As for the company, it was such a complete medley of all ranks, ages, professions, trades and occupations, brought together from all parts of world, and now for the first time met together that it was amazing to witness the decorum with which they commingled on this festive occasion. The managers, (among whom were some officers of the garrison,) must certainly be *au fait*, at dressing a lobster and mixing champagne punch in order to have produced a harmonious compound from such a collection of contrarieties. The gayest figure that was ever called by quadrille playing, Benoit, never afforded me half the amusement that did these Chicago cotillions. Here you might see a veteran officer in full uniform balancing to a tradesman's daughter still in her short frock and trousers, while there the golden aiguillette of a handsome surgeon flapped in unison with the glass beads upon a scrawney neck of 50. In one quarter the high placed buttons of a lindsey woolsey coat, would be *dos a dos* to the elegantly turned shoulders of a delicate looking southern belle, and in another a pair of cinderella like slippers would chasseur cross with a brace of thick soaled broghans, in making which, one of the lost feet of the Colossus of Rhodes, may have served for a last. Those raven locks dressed a *la Madonne*, over eyes of jet, and touching a cheek where blood of a deeper hue mingling with the less glowing current from European veins, tell of a likeness drawn from the original owners of the soil; while these golden tresses floating away from eyes of heaven's own color over a neck of alabaster recall the Gothic ancestry of some of "England's born." How piquantly do these trim and beaded leggings peep from under that simple dress of black, as its tall nut-brown wearer moves as if unconsciously through the graceful mazes of the dance. How divertingly do those inflated gigots, rising like windmills from that little Dutch-

built hull, jar against those tall plumes, which impend over them like a commodore's pennant on the same vessel. But what boots all these incongruities, when a spirit of festive good humor animates every one present. "It takes all kinds of people to make a world" (as I hear it judiciously observed this side the mountains) and why should not all these kinds of people be represented as well in a ball-room as in a legislature? At all events, if I wished to give an intelligent foreigner a favorable opinion of the manners and deportment of my countrymen in the aggregate, I should not wish a better opportunity, after explaining to him the materials of which it was composed, and the mode in which they were brought together from every section of the Union, than was afforded by this very ball. "This is a scene of enchantment to me, sir," observed an officer to me, recently exchanged to this post, and formerly stationed here. "There were but a few traders around the fort when I last visited Chicago, and now I can't contrive where the devil all these well-dressed people have come from!" I referred him to an old resident of three months' standing, to whom I had just been introduced, but he could throw no light upon the subject, and we left the matter of peopling Chicago in the same place where philosophers have put the question of the original peopling of the continent. I made several new acquaintances at this New Year's ball, and particularly with the officers of the garrison, from whose society I promise myself much pleasure during my stay. The geographical position of Chicago is so important, that I must give you a more minute description of the place in my next. Would that in folding this, I could enclose you half the warm wishes for your welfare which the season awakens in my bosom.

H.

THE AMERICAN ANNUAL REGISTER, for 1831-2: Brattleborough, (Vt.) Fessenden & Co. Boston.—We did intend to go into a somewhat detailed account of the merits of this most useful publication, in the hope of awakening attention to it commensurate with its real value, and that might in the event lead to a patronage more adequate than any it has yet received to the labor and talent with which it is prepared and conducted, and in the admirable manner as to typography, paper, &c., in which it is got up. But we have no space in our sheet—and sooth to say little leisure of our own—to devote to it at present such a notice as it should receive—as at some future day it shall receive from us.

Meantime, we make from the number before us two extracts, each of interest in its way. The first which is annexed, treats the policy of unduly hastening the settlement of the public lands, in a proper American spirit, and with a farreaching view of the benefits to distant generations of our own native citizens, for such a nursery for freemen.

There is no necessity of settling the West faster than the natural increase of the nation will do it; and the descendants of American citizens, who have been nurtured in the habits of devotion to the Union, and of respect to its laws, will furnish a better stock, than those who have been driven by improvidence or necessity from their native soil, to a country of whose institutions and laws, they are utterly ignorant, and to which they can consequently, bear no well founded attachment. The public domain now presents territory, where the surplus population of the Union can extend itself for centuries to come; and from its extent and fertility, it affords a strong security, that the American people will not be forced by density of population to that extremity of misery and crime, which is exhibited in Ireland and in the more populous counties of England. In extending themselves slowly over the continent, they will do it surely.

Time will be allowed for their political institutions to take root and to fasten themselves upon the attachments of the people. The federal government, known to them as first organizing them into political communities, and as protecting them from the inroads of savages and from intestine commotions, will be regarded with affection and confidence. They will become strongly bound to the Union by ties of early association, and the descendants of emigrants from the pleasant hills of New England, the verdant banks of the Hudson, and the sunny shores of the Chesapeake, when associated in new communities and states beyond the Rocky Mountains, will turn with feelings of respect and fraternal attachment towards the glorious scenes of that great political drama, that opened upon the field of

Lexington, and received its crowning triumph upon the plains of Yorktown. This brilliant prospect, however, cannot be realized through a policy, which would rapidly fill this vast territory with a population, driven by the improvidence of their fathers, or the cruelty of their governments from the shores of Europe. Ignorant, poor, discontented, and unfit to struggle with the difficulties of the wilderness, they would at best form a heterogeneous mass with all their early associations in favor of different institutions and other countries.

The second we give mainly to rebut a charge which we have seen made in the Globe, and in other party papers, that the facts of history purport to be given in this Register, are misrepresented through party bias. A more unfounded imputation was never uttered; for, though the Editor entertains, and in a proper way expresses, when needful, very positive political opinions, they in no instance interfere with facts or truth, in his manner of recording events.

The rejection of Mr. Van Buren by the Senate of the United States, is thus stated and commented upon:

After a full discussion on this nomination with closed doors, the Senate finally, by the casting vote of the Vice President, resolved not to confirm the nomination, yeas 23, nays 23. Mr. Van Buren was accordingly rejected; and after having presented his credentials at the Court of St. James, was compelled to return to the United States. As this was the first time that a minister had been compelled to return from his post, on account of the refusal of the Senate to concur in his appointment, great excitement was produced by this decision. The reasons set forth were subjected to severe criticism, and the rejection was by many imputed to party feeling and personal jealousy.

The friends of the Executive were urged to sustain him against an attack, which it was said was aimed at him. He was induced to come before the public and avow himself to be the author of the objectionable instructions; and his party was persuaded to bring forward Mr. Van Buren as a candidate for the Vice Presidency, as the only means of vindicating the honor of the President from a censure, which by his own confession ought to have been bestowed upon him. It was also urged, that if the Senate had been sincere in asserting, that the character of those instructions was a disqualification for a diplomatic office, Mr. McLane should have shared the same fate with Mr. Van Buren. If the instructing a minister to invite a foreign government to interfere in the domestic politics of the United States, furnished a sufficient reason why the author should not represent the republic abroad, surely the execution of those instructions ought to have excluded that minister from the cabinet councils, where measures to vindicate the honor and advance the interests of the country, are originated.

The lofty sense of national honor, which could tolerate the employment of the author of instructions so derogatory to the character of the country, would never have consented to the elevation of the ambassador by whom they were executed. This exalted feeling makes no compromise with expediency, and it regards with equal disdain, the author of a policy, which places the republic in the attitude of supplicating a foreign government, and the envoy who hesitates between the loss of his office and the presenting so obsequious a request at the foot of the British throne. No distinction could be made between them, which justified the different fates awarded to the ex-secretary and the minister, and the country was at a loss to comprehend the reason, why one was rejected and the other was confirmed.

In the contest that ensued, consequently, the opposition lost the advantage of the principle upon which it had rested the recall of Mr. Van Buren, and left the public to infer, that other motives had contributed to swell the vote against his appointment.

ANGEL'S SERIES OF COMMON SCHOOL BOOKS, FROM 1 TO 6.—Philadelphia: MARSHALL CLARK & Co. Providence, (R. I.) MARSHALL, BROWN & Co.—Mr. Oliver Angel, the author of these books, has twenty years' experience as a practical teacher, in one of the Providence district schools. His aim in preparing this series seems to have been, to carry on the learner from the first lessons in A B C, to a comprehension and appreciation of the finest composi-

tions in the language, by a regularly progressive system—each book presenting something more advanced and consequently more difficult than the preceding.

No. 1. sets forth the first steps—gives the alphabet, and a series of short words not exceeding two syllables.

No. 2 advances into larger words, longer sentences, and some short stories, care being taken in each to select the words required to be spelled, out of the reading lessons.

No. 3 arrives at figures and numbers, and the multiplication table, pursuing a progressive march as in other things.

Nos. 4, 5 and 6 are chiefly reading books, each a little more advanced than the other, until No. 6 becomes a large and well filled volume of extracts from approved writers. In each of these books questions are annexed to the extracts, in order that the fidelity with which scholars learn may be tested. The whole seem to us executed with sound judgment.

A portrait of the late Bishop Moore, of New York, intended for the forthcoming No. of the Protestant Episcopal Pulpit, has been sent to us. It is a fine engraving, and forcibly recalls the meek, spiritual, and venerable head of that truly Christian Bishop.

Music.—Major Jack Downing's March, composed and arranged for the Piano, by J. T. Norton, and published by Hewitt & Co., is the only piece of music we have recently to acknowledge.

FOREIGN INTELLIGENCE.

TWO MONTHS LATER FROM CANTON.—We have been favored with commercial advices from Canton to Oct. 22d. The Thos. Dickason was expected to sail for New York about Nov. 10th, but with few or no teas. U. S. Bank's exchange on London sold at 4s. 4d. per dollar. No sail of private bills. Ship Morrison, hence, arrived at Canton Oct. 17th.

In port, Nabob, Liberty, Eliza, Superior, Tartar, Cabot, Sumatra, Hope, Vancouver, Thos. Dickason, Col. Howard, Brighton, Panama, Omega, Martha, Neponset, Merchant, [Timor, Sabina, Hellespont, arrived Oct. 12th and 13th,] Morrison, and Italy.—Sailed, Oct. 15, brig John Gilpin, for Manila.—[Jour. of Com.]

[From the Journal of Commerce.]

LATEST FROM MEXICO.—By the ship Mexican, Capt. Davis, we have Vera Cruz papers to February 3d inclusive. Not the least important subject which at present occupies the attention of the Mexicans, relates to ecclesiastics and the church. One article is written to show that ecclesiastics ought to take no part in temporal affairs; several others are occupied in commenting very freely upon the conduct of the Pope towards Don Pedro, and his party; another is headed "The Jesuit religion, the cause of immense evils to the State;" another is taken up in discussing the nature and origin of ecclesiastical property; another in favor of toleration, &c.

Great complaints are made of the depredations of robbers, in various parts of the country. A Mexican paper of Jan. 24th says, "The stage was robbed twice last week, and once this week."

MEXICO, Jan. 27.—The Mexican capital is so plagued with robbers, that the peaceable inhabitants do not find themselves safe even in the most frequent places.

It is stated that Col. Austin had been arrested in Saltillo.

Gen. Pedraza has been appointed a member of the General Direction of public instruction.

LATER FROM EUROPE.—By the ship Henri IV. Captain Castoff, we have Paris dates of the 29th, Havre of the 30th, and London of the 27th.

In Portugal, the Queen's party have gained another victory, which promises important results.

The dates from Madrid are only two days later than before received by an arrival at Boston. The change of Ministry is confirmed, and it is also announced that orders have been issued for the convocation of the Cortes.

LONDON, JAN. 27.—Brilliant Victory over the Mi-

guelites.—"We have received important news from Portugal. Gen. Saldanha has entered Leiria, capturing the whole of Miguel's forces which were in that town. The news was brought to London this morning by an officer who landed at Falmouth, and immediately posted to London. The following is a private letter with which we have been favored:

"LISBON, JAN. 18.—I transmit you here the Chronica of yesterday and this day, by which you will see the result of the first movement of the Conde de Saldanha's division. Those who are intimately acquainted with the situation of Leiria will know that by the next packet you will hear that our army is in Coimbra, the third city of the kingdom; and his having effected a combination with the army in Oporto will speedily leave an unbroken communication between that city and Lisbon. The Miguelite force in Santarem will be obliged to retire to the southward, pursued by the 11,000 men whom we have in observation at that place; and I feel persuaded you will very shortly learn that they are completely upon the frontier of Spain. Here all is enthusiasm and confidence, and the Government feels itself more secure than ever." This is Gen. Saldanha's report to the Minister of War, contained in the Chronica of the 17th and dated Leira, January 15:

"Army of Operations.—Most Illustrious and Excellent Senhor,—His Imperial Majesty's orders are executed. Leiria is in our possession. Of the garrison, which was composed of 1,476, and 46 cavalry, only three officers and six cavalry soldiers were able to escape, taking the road to Coimbra. The Governor, Brigadier Jose de Mello Pita Osorio, two superior officers, the Capt. Mor, and many other prisoners are in our hands, as well as four pieces of artillery, and the Ensign of the regiment of militia of Leiria. The Corregidor, a perverse man, was killed; in a word, the overthrow could not be more complete. To-morrow I shall have the honor of sending to your Excellency the details of this day, and of the movements which preceded it. A corporal of Oladores, No. 5, wounded; this is all our loss! The affair of Aleacer is well avenged. God preserve your Excellency.

(Signed) "CONDE DE SALDANHA."

"Postscript—All the enemy's baggage fell into our power." Gen. Saldanha, though intending to move towards Coimbra, remained at Leiria on the 16th, and on that day sent a despatch to the Government, giving a full account of his proceedings from the time of leaving the army before Santarem on the 12th, and details of his success at Leiria. The Miguelites, it appears, gave up their strong position in the Castle, apprehensive of having their retreat cut off. As they were moving away, they were attacked by the cavalry under the orders of Colonel Bacon, and completely routed. The result is stated in the despatch already quoted. Beside the Governor, Col. Don Jose de Mello Freire Pita Osorio, Saldanha has captured a considerable number of officers and soldiers. The news from Santarem is also of importance. By the Chronica of the 18th, it appears that on the 15th, the day of the last accounts, the cholera morbus was raging violently at Santarem, and that provisions and forage were getting so scarce, that since the 16th more than twenty have died per day. The Pedroites have gained an advantage also at Marvao; and, according to all these accounts, the Miguelites cannot possibly long hold out. Even Miguel himself is said to be very ill, and has of late not allowed himself to be seen.—[Courier.]

SPAIN.

Convocation of the Cortes.—The Indicateur of Bordeaux of January 25th says: "We yesterday learnt officially by a courier extraordinary, that the Spanish Government has issued two Ordinances for the immediate convocation of the Cortes per estamentos."

Extract of a letter from Madrid, dated the 17th instant: "It is certain that the Great Powers have complained to England and France of the late excursions of the Spanish troops into Portugal, and that the British Cabinet has delivered to ours a note protesting against their being renewed under any pretence, and declaring that his Britannic Majesty would consider any future violation of the Portuguese territory by a Spanish army as an act of aggression against Great Britain, in consequence of the union which exists between that nation and Portugal, founded on ancient treaties. This had an ill effect at the court of Spain." No intelligence had been received from Madrid subsequent to the 17th. At that time the population of the capital was full of enthusiasm at the accession of M. Martinez de la Rota to the ministry.

The Sentinelle des Pyrenees of Bayonne has the

following, of the 17th inst. from Aldudes;—"It is said that the port of Guetetaria is in the power of the Carlists, and that two British vessels have landed 10,000 muskets, and equipments for 10,000 men.

Colonel Bayona, who took refuge in France, having learnt that the Carlists had retired, immediately returned to the ironworks of Orbaiceta, of which he is director. The Spanish families, who, for some days past, have lived in huts on the French frontier, will doubtless return to their homes without delay."

FRANCE.

M. Laffitte's Hotel, in the Rue Laffitte, was put up to auction yesterday at an upset price of 978,000 fr., but there being no bidder the sale was postponed to an indefinite period.

PARIS, JAN. 28.—The Budget Committee have signified their dissent from the number of men laid in the estimate of the Minister of War, for 1833, Marshal Soult proposed a conference with them, and the Committee assembled for that purpose on Sunday, at the Palace of the Chamber of Deputies. In the estimates the effective of the army was fixed at 374,000 men, but the Marshal consented to reduce it to 310,000, the same number as voted for 1834. Some of the members of the Committee were for reducing it to 294,000 men, and others for fixing it at 310,000. The Minister declared that the honor and interest of the country did not allow him to descend below 310,000 men, and that if this number were refused Ministers would resign in the mass.

Postscript to a letter from the French Admiral Baron Hugon, commanding the French squadron on the Levant, by which he announces to the Minister of the Marine the loss of the French ship of the line *La Superbe*.

"P. S. I opened my letter to announce that the *Cornelia* has just been despatched. I have also learnt that the American ship the *United States*, Commodore Patterson, which left the Bay of Smyrna a few hours before the *Superbe*, after having lost some of her masts, had her sails torn away, and her boats carried off, and being nearly embayed off the coast of Andros, and expecting every moment to be lost, a sudden gleam of light enabled her to discover the narrow passage between Tina and Andros, she was enabled to get through it and gain the harbor of Milo."

The *Iphigenie* frigate, bearing the flag of Rear-Admiral Baron Hugon, and the *Duquesne*, of the line, Capt. Casey, arrived at Toulon on the 26th inst. from Nauplia, bringing with them 446 men of the crew of the *Superbe*, (wrecked)

FOREIGN VARIETIES.

THE ARTS IN AUSTRIA.—The care taken by the Austrian Government to prevent the people from mixing themselves up with politics, has the natural consequence of driving them to the study of the arts and sciences. Thus there are few countries in which we find so many savans and amateur artists as in Austria. Every person in comfortable circumstances gives himself up to the study of some favorite branch of art or science, to which he consecrates all his leisure hours; and what lover of such pursuits has not admired the beautiful galleries of pictures of the Princes Esterhazy and Liechtenstein, as well as the splendid libraries of Count Czarnin, Lamberg, &c., and the treasures of M. de Hammer, who possesses a greater number of Oriental manuscripts than are to be found at Constantinople or the College of Ispahan? M. Tröstl, directed by another kind of love for Eastern curiosities, has made a collection of all the varieties of pearls which are found in the fisheries of the Persian Gulf, at Ceylon, or in the diverse harbors of the Indian Ocean; and M. Pehl, a collection of Brazilian flowers not to be equalled in Europe. Collections of herbs, medals, minerals, libraries full of rare books, and galleries of pictures, are found in every town of the least consequence in the Austrian empire. At Milan, the Chevalier Iitta Blumi exhibits his colossal map of Italy; and at Pesth, M. Janowich does the honors of his rich collection of Hungarian antiquities. It will appear, therefore, that it is not only in the capital that precious and varied treasures are to be seen. Vienna, however, distinguishes herself above all the towns of Austria for her cultivation of music.

A stranger visiting Vienna would think that on music actually depended the existence of the people, for music of all descriptions strikes the ear in every direction. To enumerate all the Unions and Societies, public and private, instituted for the propagation of this science, would be perfectly impossible. The chief public institutions is the Imperial Music School, at which pupils may become members gratuitously. The Society of Amateurs, established

about twenty years, also has had a great influence on the development of the science of music in Austria. The archives of this Society possess more than 800 concerted pieces, and the library 1240 works on the theory and practice of music; besides a fine gallery of portraits of the most celebrated composers, a large collection of autographs, and a museum of rare, ancient and modern musical instruments. The Royal Library is truly one of the richest depots of ancient and modern music. It consists of sixteen large apartments, containing 4000 musical works, which number 6500 volumes. Amongst the private collections, that of Count de Fuchs is most worthy of notice, consisting of upwards of 1000 concerted pieces and M. Alexander Fuchs, brother of the former, has a collection of autographs of the most celebrated musical composers, amounting to 500. To the lovers of a cremona the collection of instruments of M. Francis Rychaczek would offer a great treat; it consists of upwards of 200 violins, violincellos, and double basses.

The Whigs and the Church.—We have, hitherto, in every question of politics in which we have presumed to say a word, endeavored to appear at once open and honest. Not to be open is, indeed, to be dishonest. But we have also, when stating our opinions, stated them with due reference to the judgments of our superiors; and we shall, as respects this important question, do as we have done on former occasions.

Our opinion here is not wavering, though it may be wrong. It is decided; we are sorry to hear of those proceedings at Gateshead, the object of which, as we understand the reports, is to make a first attack upon the House of Lords at a point where it is by far the least vulnerable. We are not amongst those who like to see the church supported by such "pillars" only as are set up by the solicitation of a king's minister or the intrigues of a royal mistress. But, supposing the election of bishops to be proper, we have no hesitation to declare that in this country, which has a state established church, the bishops have at least as much claim to respect and confidence, that they are, at the very least, as members of the Upper House, as necessary to the state as the other lords. If the saying, "*Ordo Episcoporum robur reipublice*," be found to be not true, the whole of the *ordo* *Liacorum*, with which the bishops are associated in the House of Lords, had better quickly prepare themselves with proofs to show what strength they afford to the nation.—"Bishops," it has been said, "should not take part in matters of state." Why not, since the department over which they preside is a part of the state? Much better, it seems to us, that both they and their doings should appear in the House of Lords, than that, being hidden by obscurity, they should be perhaps more under the beck of corruption than a seat in the House can make them.

Probably we are letting out all we think at a moment when some who would disagree with us have views undeclared. If so, any such advantage against us is unfair. There are some who have, indeed, been pretty open in their avowals. But there are a great many who would do their best towards effecting the whole of that, the greater part of which they profess not to aim at. What then are the propositions to be discussed?—what is the end in view, and the whole of it? To undermine the church in general; to remove only its main supports; to put an end to bishops, merely to make a hit at the hereditary lords through the bishops, or to abolish the joint bench, spiritual and temporal, altogether.

If the church is now in danger, the danger is owing to the wisdom of the whigs; the whigs, who have been pound-wise for themselves and penny-wise for the people. What a faction has this been! What a new trait gained to the character of dishonesty, revealing by the delusion of confidence, when those who became the pilots in the storm turn into pirates over a wreck of their own making, and, clinging on to the last, surviving all they had taken in charge, are half cocked with a surfeit of plundering the sunk before their own noses are under water!—[Cobbett's Magazine.]

National Education in France.—The Bill regulating Primary Instructions in France, termed the *Projet de Loi*, introduced to the Chamber of Deputies by M. Guizot on the 2d of January last, and passed into a law on the 28th of June, provides for the establishment of schools of three descriptions. Every commune or parish is bound to provide, either by itself or conjointly with one or more neighboring parishes, one primary school of the lowest order. In this school moral and religious instruction is to be given to the children, reading, writing, the principles

of the French language, ciphering, and an acquaintance with the authorized system of weights and measures are to be taught. The master of this establishment is to be furnished by the parish with a suitable house and fixed salary, the minimum of which is to be 200 francs, 51. 6s. 6d., and in addition he is to receive from such of the parents of the children as can afford it, fees or quarter pence. The fees are to be exacted, not by the master himself, but by a public officer on his account. County towns and parishes having a population exceeding 6,000 souls, are bound, individually or conjointly, to maintain a school of the second class, in which, in addition to the instruction given in the first or lower order of schools, the children are taught the elements of geometry, with its ordinary applications, particularly to linear drawing and land measuring; the elements of the physical sciences and of natural history, as they are applicable to the common uses of life; singing; the elements of history and geography, and especially the history and geography of France.—The wishes of the fathers must, however, be consulted and complied with as to their children's participation in the religious instruction given. As this second class of schools are designed for the children of parents above want, there is no gratuitous admission except in the case of extraordinary talents in the poor scholar of the lower species, who receives the advantage of a higher education as a reward; but, in order that the rate of payment may be very moderate, the master is to receive a fixed salary, of which the minimum is 400 francs, (161. 13s.) along with the fees. In this class of schools, as well as the former, the fixed salary of the master is to be paid wholly by the parish, if possible, or, if not, partly by the department or county, and the state itself is to come in aid as a *dernier resort*. The third class of schools, styled the *Normal*, are for the training of masters, and of these there is to be one in every department.

New Gigantic Telescope.—A great work has just been completed in all its essential parts, in Urzschneider's manufactory of optical instruments at Munich. It is a gigantic telescope, on Fraunhofer's principle, of 15 Paris feet focal distance, and an aperture of 10 1/2 inches. It surpasses in size and power the largest telescopes made in the lifetime of the illustrious Fraunhofer. It has been tried with the greatest strictness by the professors of astronomy in the University of Munich, and declared to be a perfect masterpiece. The clearness and distinctness of a heavenly body seen through it, is, to that of the Dorpat telescope made by Fraunhofer, of thirteen feet focal distance and nine inches aperture, as 21 to 18, and the intensity of the light as 136 to 100. It magnifies far above 1000 times, and the ordinary expression of bringing an object nearer may be literally applied: thus, when Saturn at its smallest distance from the earth, is 165,000,000 of geographical miles distant, it seems, when magnified 816 times by this telescope, to have approached to the distance of 192,000 geographical miles; and the moon, at her smallest distance from the earth, seems, when magnified in the same manner, to have approached within 68 geographical miles, which is but little more than the distance, in a direct line, from Athens to Constantinople.

The number of State Pensioners in France, on January 1, 1833, was 162,175, who are thus divided: peers, 128, receiving 1,564,000 francs; civil pensioners, 2593; receiving 1,733,400 fr.; pensioners of July, 1408, receiving 613,700 fr.; military pensioners, 127,011, receiving 46,603,221 fr.; ecclesiastical pensioners, 28,186, receiving 4,662,469 fr.; *donataires*, 2,952, receiving 1,480,084 fr. Total, 162,175 pensioners, receiving 56,735,874 fr.

MAXIM.—When you have made a good bargain be sure you clench it with a deposit before the other party has time to retract. Often when a man may be bargaining with you in jest, if the advantage be on your side, you may pretend you thought him in earnest; and so sometimes, make a very good piece of business of it. It will not only be of good to you, but it will benefit him by teaching him never to jest about business. I will tell you a story:—A man that I am very well acquainted with, and who was not always so well to do in the world as he is now—I do not say it was myself, but it was a Scotsman who had risen from a very low beginning. His outward dress did not always tally with the lining of his pocket; indeed, the pocket when he went to market was but ill held up by the rags which it was sewed to; to look at him you would not have thought him worth a plack. Well, one morning, a cargo of hides coming into port, he went and asked the owner what he would sell his whole cargo for?—Looking at him from head to foot, the owner could

hardly refrain from laughing outright. "My good friend," said he, "I think it matters little to you the price of the cargo: a single hide, I should imagine, would exhaust your whole purse." "When folk come to buy," said our Scotsman, "they expect to be treated with civility. Will you answer me a plain question? What's the price of the whole cargo of hides on board your ship Prosperity, now in harbor?" The shipowner still thought the man was daft or joking, and he said, "What will you give me for the cargo, ready money down upon the table?" "Gude sir, it's not for me to put a price upon your goods; tell me what is the lowest price you'll take?" The owner still carrying on the joke, (as he thought,) named a price not half the actual value. The merchant, of frugal appearance, put his hand in his pocket, took out a shilling, and clapped it into the hands of the owner, crying aloud, "A bargain! my friend, and before these witnesses," turning to those who had been amused with the conversation that had passed. Viewing the man still in the same light, and never suspecting that he had to do with a man of money, the considerate owner proffered back the shilling to the man of rags, saying, "Here my good man, though I have been cutting some severe jokes upon him, I would not wish to rob you of a shilling; judging from appearances you have very few to spare." The buyer advanced with a firm step, and looking him in the face, said, "Sir, judging from appearances, it may be so; but I can tell you I did as give ye that shilling that it might be returned in the character of an almshouse: that shilling is the arles o' my purchase of the whole of your cargo; tell me, therefore, when you will deliver it, and receive your money! or, said, he (taking out of his pouch the foot of an old stocking, well darned and patched, heavy with gold and crumpled with bank notes, "if any substantial person will be responsible for the delivery, I'll pay ye the siller down on the table this minute." Every attempt at explanation or accommodation was in vain; and at last the owner was compelled to give up his cargo of hides at less than half their value; and he received the money agreed upon forthwith. As it was the only cargo that had arrived in the market for some time, the ragged man of money sold his hides at almost his own demand; and he aye said it was the best bargain he ever made in his life. A ragged coat, ye see, has its advantages as well as a good one; but mind, never joke about business.—[Glasgow Courier.]

SUMMARY.

Extract of a letter from a gentleman at Prairie du Chien, Upper Mississippi, Feb. 1.

I wrote to — from Mineral Point, since which I have heard that the Sacs and Foxes have killed 16 Winnebagoes, and my friend and gossip Whirling Thunder is about to come down upon the Black Hawk people with 700 warriors at his back. He swears he will exterminate Black Hawk's band. The fighting, if any takes place, will be far in the rear of me I may see some of the fun, however, when I return.

[From the Philadelphia papers of yesterday morning.]

DREADFUL DISASTER—LOSS OF LIFE.—The most serious disaster that has ever occurred on the Delaware, took place yesterday afternoon. The steamboat William Penn, Capt. Jeffries, on her way from New Castle to this city, took fire just before she reached the Point House, and was run ashore immediately above the Point. There were upwards of one hundred and fifty passengers on board at the time, and the awful scene that ensued can be better imagined than described. It is impossible to state at this time the number of persons who perished, as there are various contradictory rumours in circulation. Three dead bodies, two male and one female, reached this city last evening. Every exertion was made to restore life, but in vain. The names of the sufferers are, Colonel Joseph S. Porter, of this city—the Rev. John Mitchell Moore, of Lewistown, Del., and an unknown female. It is stated that the latter sprang into the water from the stern of the boat, and Mr. Moore immediately after her—that when taken up, both were alive, but they died from fright, suffering, and cold. One individual, a passenger, stated to us that he observed another female spring into the water and sink before assistance could be rendered.

The conduct of the officers of the boat, from the moment the accident occurred, is represented to have been of the most praiseworthy character. The place where the boat grounded is within about fifty

yards of the Banks of the Delaware, on the Pennsylvania side, and the passengers, male and female, were compelled to wade some distance in mud and water, to the depth of several feet. Of course they were wet to the skin, and their cloths disfigured with mud. Several lost their hats, others their shoes, &c. Most of the baggage was saved, also the Southern Mail.

As soon as the fire was discovered, a number of small boats hastened to the assistance of the sufferers—also, the South street steamboat, one of the Market street boats, and the Burlington from Chesnut street wharf. The passengers, for the most part, were brought up in these vessels. Thousands of our citizens lined the wharves from the moment the fire was discovered, untill long after nightfall.—Great anxiety was felt by those who expected friends and relatives, and hundreds of persons rushed to catch a glance at the dead bodies, fearful that some one dear to them had passed into the valley of death.—The fire is said to have originated in the wheel house. When first discovered, an effort was made to check it, but it was soon found impossible, and to escape from the devouring element became the object of all.

The boat continued burning for several hours, and presented a beautiful but a melancholy spectacle. About half past six o'clock she floated from the shore, and came up the river, still burning, as far as the island opposite the city, where she again went ashore, and was burnt to the water's edge. We regret to learn that the loss sustained will be about \$70,000.

Such are the leading particulars of this melancholy catastrophe, the first accident accompanied with loss of lives that has occurred on the Delaware since the introduction of steamboat navigation.

THE STEAMBOAT WILLIAM PENN.—Another of the passengers in this boat has perished, Mr. Walter W. Buckley, of Connecticut. He died from the effects of cold and exposure.

The body of the female has not yet been recognized. A ring upon her finger has the following words: "Let love abide forever. J. B."

Further search has led to the conclusion, that two large portmanteaus, containing the letters from Baltimore city and the west, embracing as is supposed, Cincinnati, Ohio State (south) Illinois, Indiana, Kentucky, West Tennessee, Maryland Western Shore, and Washington, Brownsville, Union Town, and New Geneva, Pa. and for distribution, have been entirely consumed.

A newly discovered vegetable, called the Oxalis Crenata, a rival to the potato, has lately been imported from Chili and cultivated with great success in Suffolk (England.) The flavor of the root is decidedly superior to that of the common potato, and it is equally prolific.

The steamboat Wm. Gibbons, which left New York on Saturday, at 4 P. M. was seen on Monday, at 6 A. M. 40 miles north of Hatteras—wind fresh from the northward.

More and More.—The New Orleans Bee of Feb. 17th, announces the arrival of the schr. Creole from Tampico, with about FOUR HUNDRED THOUSAND DOLLARS IN SPECIE.

A curious blunder occurred in the business of the Common Council on Wednesday evening. Isaac Auld, was appointed weigh-master vice Albert Cox deceased, and yet Mr. Cox is in good health, and one of the most extensive weighers in this city.

It is stated that the Fire Insurance Offices in this City have decided not to insure any steamboat unless provided with a force pump or engine and hose, sufficient to throw water to any part of the boat, in case of fire. Such means of protection, if on board the William Penn, might have saved the destruction of the boat and lives of those who perished.

Disaster.—The packet ship Mississippi, Captain Robinson, from New Orleans, for this port, went ashore on Wednesday afternoon, at six o'clock, in a thick fog, on Brigantine Shoals, twenty miles south of Barnegat knocked off her false keel and thumped considerably. She has on board a full cargo and \$100,000 in specie for the United States Bank. The M. is a new and superb ship. She is insured in Boston, and the cargo in New York. The passengers left her soon after she struck in a schooner which was passing, and arrived in the city yesterday afternoon. A steamboat was immediately despatched and several lighters in the hope of saving the cargo, and if possible the ship.

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate.
David Hodge, Register of the Land Office at Steubenville, Ohio.

James C. Sloo, Register of the Land Office at Shawneetown, Illinois.

Charles Prentiss, Register of the Land Office at Vandalia, Illinois.

William L. May, Register of the Land Office at Springfield, Illinois.

Robert S. Garnett, Collector and Inspector at Tappanhook, Va.

Henry S. Whitely, Collector and Inspector at Wilmington, Del.

John W. Smith, Surveyor and Inspector at Portland, Maine.

Levi Fagan, Collector and Inspector at Plymouth, N. C.

Archibald W. Hyde, Collector and Inspector at Alburg, Vt.

William Beach, Collector at Gloucester, Mass.

Mahlon D. Canfield, Collector and Inspector at Great Egg Harbor, N. J.

Martin T. Morton, Collector and Inspector at Nantucket, Mass.

The above are all re-appointments.—[Globe.]

Edward Livingston, to be Envoy Extraordinary and Minister Plenipotentiary to the Court of His Majesty the King of the French.

Thomas Pennant Barton, to be Secretary of the Legation of the United States at Paris.

Arthur Middleton, Jr. to be Secretary of the Legation of the United States at Madrid, in the place of Charles S. Walsh, removed.

Joseph S. Cabot, to be Commissioner under the law to carry into effect the Convention between the United States and His Majesty the King of the Two Sicilies, concluded on the 14th of October, 1832, in the place of Peter V. Daniel, resigned.

Romulus M. Saunders, to be Commissioner under the law to carry into effect the Convention between the United States and His Majesty the King of the French, concluded on the 4th of July, 1831, in the place of Thomas H. Williams, resigned.

John W. Overton, to be Clerk to the Commission under the law to carry into effect the Convention aforesaid, between the United States and His Majesty the King of the Two Sicilies, in the place of George Breathitt, deceased.

James Collinsworth, to be Attorney of the United States for the Western District of Tennessee. Re-appointed.

John Patterson, to be Marshal of the United States for the District of Ohio. Re-appointed.—[Globe.]

Appointments by the Governor and Senate, February 26, 1834.

ALBANY—William Weaver, inspector and admeasurer of wood and timber; also, measurer of stone. John W. Stilwell and Philo Booth, inspectors of beef and pork. Harmanus S. Van Ingen, Theodore Olcott, Henry Bartow, Thomas W. Olcott, Philip S. Van Ingen and Frederick H. Pepoon, notaries public.

BROOME—George T. Ray, auctioneer.

SCHENECTADY—Roswell Perry and Wm. Freeman auctioneers. Cornelius G. Palmer, Wm. Strong, Wm. Meeker, Robert Barker, Jacob Swits, Joshua D. Harman, Abraham Van Ingen, Stephen A. Daggett, James M. Bouck and Henry Fuller, commissioners of deeds.

CHENANGO—Walter M. Koney, notary public.

OSWEGO—John Reynolds, judge of county courts. Lewis Parker and I. Foot Turner, auctioneers.—Wm. F. Allen, examiner in chancery. Avery Skinner, judge of county courts.

TIOGA—Silvester Sexton and Walker Canfield, inspectors of lumber.

CAYUGA—Ezekiel Williams, Bradley Tuttle, Ulysses F. Doubleday, Thomas Y. How, jr. and John Garrow, inspectors of the State Prison at Auburn.

CATTARAUGUS—Albert C. Burge, supreme court commissioner. Moses Beecher, surrogate.

DUTCHESS—Robert S. Livingston, judge of county courts. David V. N. Radcliff, supreme court commissioner. James Grant, jr. and Alexander Forbes, notaries public. Joseph Gunn, Jacob Barringer, Stephen Jennings and Samuel Gunn, inspectors of beef and pork. Lemuel Conklin, inspector of flour and meal. John Lewis, James Montfort, John Ward, jr. and Henry Gale, auctioneers. John Brush, examiner in chancery.

RICHMOND—Jacob Tyson, first Judge; Daniel Mersecau and Samuel Barton, judges of county courts. Richard Crocheron, surrogate. Robert M. Hazard and Wm. S. Root, notaries public. Philip Gibson, Abraham Autin, Wm. Shea, and Andrew B. Decker, auctioneers.

CLAIMS ON FRANCE.—Notice has been given by the Board of Commissioners under the Convention with France, that all claimants, whose memorials are not yet filed, or are not received in consequence of some defect, must file them with the Secretary, on or before the first Monday in May next; after which period no new one will be received, unless good cause be shown why it was not previously filed. These are required to be prepared and verified according to the former regulations of the Board, and are to be set down for examination, at the expiration of the month from the date of their reception. So much of the previous orders, as directs that no document shall be received by way of proof or otherwise after the memorial is set down for examination, is suspended until the first Monday in May, to which time the Board, on the 21st instant, voted to adjourn, with the intention of then proceeding to the examination of the several memorials.—[Daily Adv.]

MOBILE, Feb. 14.—There were no papers from the East today. We have now eight paper mails due from New York, and six from Washington.

SHIPWRECK.—The schooner *Pomona* from Nassau, at Savannah, on the 19th February, reports that brig *Bacmum*, P. Sheffield, master, from Charleston, S. C. bound to New-Orleans was wrecked on Abaco, when only 56 hours from Charleston. All the crew and passengers, including 45 slaves, was saved. The latter on landing were liberated. The following letter is from a passenger—

"Nassau, Feb. 12, 1834.

"From the time we left Charleston, we had uncommon fine weather, and was under the impression that we would certainly reach New-Orleans in a week at least, but on Monday night, precisely at twelve o'clock, the vessel struck on *Abaco Reef*, and filled in twenty minutes afterwards; the masts were immediately cut away to lighten her, but all in vain; she began to thump so violently that the Captain ordered all hands to secure themselves, for he said she would not hold together another hour. Young Smith and myself lashed ourselves to the mainmast, as well as the rest of passengers, amounting in all to sixty-nine souls. After being in this situation a few hours, the vessel went down bow foremost, and only a few feet of her stern remained above the surface of the water. We then began to make preparations to secure our lives a little longer, for death appeared to us inevitable. In attempting to get the small boat, which was the only one we had, on the lee side she filled twice, and it was with the utmost difficulty she could be kept free. Eight of us left the wreck in her before the dawn of day, to seek for land. As soon as daylight came we discovered land, about five miles distant. It proved to be Fish Key, a small island inhabited only by a single family of fishermen. On this desolate place, we remained four days, subsisting on what we could catch, having scarcely enough to keep us alive. We were then carried by the fishermen to Green Turtle Key, where we remained a day and a night, and lastly we were brought to this place completely destitute."

Mr. Auduson.—The following whimsical letter written by this enthusiastic bird hunter to a gentleman in Boston, is from the Transcript.

"When we left New York, I expected to be obliged to sail instant for Old England. We passed through Philadelphia, working there like horses—my good wife and I—packing birds, 3500 skins, for Europe. Had to collect money due me there—and had other trouble. Pushed for Baltimore. Had to shave every day. Ran up and down both sides of the streets. Procured four new subscribers—collected some cash—and off to Washington city to see the Grandees. Received grandly. No subscribers—no cash. Heavy bill at the Hotel—Town dull—country shockingly poor. Cleared at the Custom House, for Baltimore again—took to the water. Had a storm. Not lost—but tremendously scared. Saw Norfolk by night, and James River by day. Reached Richmond. Pleasant reception. Made and received many calls. Handful of promises, but not a jot done for us. Crops short—produce low. Huzzas for the South! Coach to Petersburg. Only fourteen passengers—four harps, three violoncellos, one bass, and sundry tambourines. Have you travelled the Petersburg Rail Road? No. Well don't. Like to have been starved and roasted to boot—travelled hard, and fared harder. Coaches full—horrid brutes—eat like pigs, and swear like devils. Reached Fayetteville. Good

boiled eggs—excellent substitute for stones, in this country. Got to Columbia—saw the College and President Cooper. Hired a private carriage to Charleston. The horse laid down on the road. Hired another at seven dollars per diem, and three more for his blades. Rode slow—saw nothing strange, and, thank God, at last reached Charleston, and the hospitable mansion of our worthy friends, the Rev. J. B.'s family. Have worked hard ever since. Have thought of writing to you one good hundred times, but whenever I was about to make a pen, my brushes stared me in the face, and not only so, but actually said to me, (for my brushes speak) "Finish those Birds of America before you write"—and so I did.

"My plans have been frustrated. I feel I shall have to go to England, instead of the Southern Swamps and Western Prairies. If it be determined that I go to Europe, you will see me in Boston in less than a month after you receive this. If not, I shall write to you. I have been so constant at my great pine table, that I have been out shooting only twice—and once only to dine out. Evening parties you knew I abhor—unless I am invited to dance! My good friend has been copying my Biography for publication. * * * We are well. * * * Thank you for Smith on Fish; but I prefer Grouse to Fish—Chickens to Grouse—and Blue-winged Teal to Canvas-Back Ducks. * * * Yours, truly, J. J. A.

There is a degree of humor and arch satire in the annexed article—which has long been waiting a place—that few alone seem master of, now-a-days.

The fastidiousness which renders the most noble Marquess of Snowden so reluctant to be seen emerging from an Omnibus, under any circumstances, is not entirely without a parallel among some of our most *recherchés* personages.

LIFE IN AN OMNIBUS.—Lord Snowden has just broken a shaft of his cabriolet, on a wet day, upon Barnes Common; an omnibus rattles up, and the Tiger, no house nor aid being near, persuades his lofty master, the destined Governor General of India, to 'get in.'

'The Marquess stepped in, and the conductor gave the word, 'all right,' but this was done so soon after the admission of his Lordship into the vehicle, and he was so long picking out a clean place to sit down upon, that the jerk threw his Lordship forward into the lap of the 'attest woman that ever was seen out on a caravan at a fair, who, unfortunately, was carrying a jar of pickled onions on her knee, which was upset by the Marquess's tumble, and in its fall saturated the front of his Lordship's waistcoat and stock with its fragrant juice.'

'The dirty dandy in the corner, as soon as he saw the voluntary contortions of poor Lord Snowden's countenance, as the huge thing bumped up and down, and twisted first one way and then another, began to affect a similar distaste for the conveyance; and to mark his sympathy with the new arrival, forthwith bumped himself up close to him. He looked at the Governor-General Bahander for a moment or two, and then pulling out a sort of whitey-brown paper funnel, which did duty for a snuff box, offered it to the Marquess.'

'After a short delay, during which several aristocratic carriages rolled by—at which periods the Marquess adopted the celebrated system of *ostrichism*, and hid his head—the omnibus rattled on towards town. At Waltham-green, two tall scraggy girls from a boarding-school,

Sickly, smiling, gay, young, and awkward, were poked in. A gentleman with very red mustachios, was picked up at the Queen's Elm gate; and a poulterer's boy, with a couple of skinned rabbits in a tray, was added to the party at the corner of Sloane-street, the said rabbits on their way back to a poulterer's in Duke-street, St. James's, because they were not fresh.

'The Marquess made a thousand well-bred apologies, and was got up upon his legs by the exertions of the fat woman, whose struggles to rescue herself from the imposing weight of nobility, materially assisted the efforts of a good-natured dirty little man in the corner, and a thin spare woman, who was carrying a bantam-cock and three hens in a basket to London, having on her other hand a large faced child, with great blue eyes, and a cold in its head. It wore a brown skin cap, with a gold band round it, while a green and white net comforter was twisted round its chin and body; its dress, generally, bearing very strong evidence that the dear little thing was an extremely bad traveller.

'Near the door, and over whose shins the Marquess first tumbled upon getting in, was placed a stout, blue-aproned market-gardener; and opposite to him, a smartish looking man, with a Mosaic gold chain round his neck, and a bunch of oily curls coming out from his hat just over his hair—he was the dandy of the party.'

'Off went the omnibus—rattle went all the windows—slap went the weather boards, bang went the axle-trees; and away went the whole concern at a rate and with a noise, of which the Marquess till that moment had but a very faint conception.

'At the top of St. James's street the caravan stopped. The day had cleared up; the pavement was dry. The King was in town; there were many people about. Lord Snowden just peeped through the windows, and saw groups collected—men he knew. Here it was clear he could not get out—whither should he go? how far—what place was safe? At length he resolved upon going the whole journey to the Bank, so that he might emerge in the city, and then enveloping himself in a hackney-coach, reach the habitable part of the town, without fear of discovery.

'Any body for White Oss Cellar?' said the man on the steps. Out went the dirty dandy, the man with the apron, and the boy with the rabbits. But their places were instantly supplied by a portly gentleman lugging in a small sized green garden-engine with a fan spout, and three fishing-rods, which he had just bought at the corner of Albemarle street, and a fond mother who had provided herself with a heap of toys for her six children.

'Still the Marquess kept peering out of his prison—nobody saw him—and it was pleasant to peep through the loop-holes thus unobserved. In a few minutes all was right, but the pavement in Piccadilly was up; it was necessary, therefore, that the huge machine should go down St. James's street; and so it did; but short was its progress in that line of march—all the bumpings and thumpings which its rapid course in the earlier part of its journey had excited now were to be compensated for. The driver smacked his whip, the horses obeyed the sound; when bang went something, and in an instant the whole fabric came down with a crash like thunder, exactly in front of White's.

'The shrieks of the women, the cries of the men, the noise of the fall, all combined to attract a thousand spectators. Fifty heads were out of Crockford's Coffee-room; all the guardsmen rushed into the balcony; and in the bow-window of White's itself, which was instantly thrown up, were heard the well-known voices of the leaders of the clique, in a sort of war-hoop, which, like the whistle of Rhoderick Dhu, roused the whole clan to observe the dreadful *denouement*.

'In detail were the passengers extricated. The dear little boarding-school girls jumped out first: the fat man with his garden-engine, stuck in the door-way, and was only ejected by the ponderosity of the still fatter woman, with what she called her 'union jar,' clasped like a lovely baby to her bosom; the lady with the toys was trampled under foot; the sick child was jammed under the dirty man in the corner, and the thin woman who took care of it, getting anxious about its fate, unwillingly abandoned the poultry; and when the most noble the Marquess of Snowden, K. G. and Governor-General of India, emerged, amidst the cries of 'take care of the old gentleman,' he came out without his hat, with a fine bantam cock perched upon his head, and a couple of fuzzy-legged hens roosting upon his shoulders.'—[Hook's Sayings and Doings.]

THE SPANISH ARMADA.

[From Southey's *lives of British Admirals*.]

'Meantime, though the negotiations at Ostend were still carried on in policy by the Spanish commissioners, there was on the part of the Spanish government a disdainful disregard of secrecy as to its intentions, or rather a proud manifestation of them, which, if they had been successful, might have been called magnanimous. The great king had determined upon putting forth his strength, and so confident were his subjects of success, that in the accounts which were ostentatiously published of its force, they termed it 'the most fortunate and invincible Armada.' The fleet, according to the official statement, consisted of 130 ships, having on board 19,295 soldiers, 8450 mariners, 2088 galley-slaves, and 2630 great pieces of brass; there were, moreover, twenty caravels for the service of the fleet, and ten six-oared *faluae*. The names of the most popular Romish saints and invocations appeared in the nomenclature of the ships; and holier appellations, which ought never to be thus applied, were strangely associated with the Great Griffin and the Sea Dog,

the Cat and the White Falcon. There were in the fleet 124 volunteers of noble family, having among them 456 armed servants.

There was no noble house in Spain but had a son, a brother, or a nephew in the voyage, embarked either at their own cost, or in the king's pay. The religioners who embarked for the service of the fleet, and for after operations, were 180, consisting of Augustinians, Franciscans, Dominicans, and Jesuits. Don Martin Alarcon embarked for the good of the heretics, as vicar-general of the holy inquisition; and implements of conversion of a more cogent kind than argument or persuasion are said to have been embarked in sufficient quantity. The business of reconciling England to the Romish see was committed to Cardinal Allen, as it had formerly been to Cardinal Pole, and an English translation of the pope's bull was ready for circulation as soon as a landing should be effected. The galleons, being above sixty in number, were 'exceeding great, fair, and strong, and built high above the water, like castles, easy, (says a contemporary writer,) to be fought withal, but not so easy to board as the English and the Netherland ships; their upper decks were musket proof, and beneath they were four or five feet thick, so as no bullet could pass them. Their masts were bound about with oakum, or pieces of faxed ropes, and armed against all shot. The galleasses were goodly great vessels, furnished with chambers, chapels, turrets, pulpits, and such like: they rowed like galleys, with exceeding great oars, each having 300 slaves, and were able to do much harm with their great ordnance.' In place of the Marquez de Santa Cruz, who was dead, the Duque del Medina Sidonia was general of this great armament; Don Juan Martinez de Ricalde, admiral."

The following addition will be considered very curious:

The Invincible Armada, as it was to have been, according to the Plan of the Duke of Alva.—The Invincible Armada with which Philip the Second designed to subdue England is sufficiently well known. His treasury was exhausted by the sums which he expended on it, and never after recovered its pristine palmy state. For the times, this armament was the largest which had ever been fitted out, for it contained no less than 130 ships of war, of which 65 were of the line, their tonnage was 57,868 tons. They carried no less than 2431* guns and mortars, 123,790 shot, 5175 hundred weight of powder, 1238 hundred weight of lead for the arquebuses (plomo para la arcabucera,) and 30,658 men, together with the necessary provision. They were accompanied by 180 priests and friars, being at the rate of one for every 155 men. There were also on board, of biscuit 11,000 cwt., bacon 6000 cwt., and cheese 3000 cwt. This, however, was not by any means the Invincible Armada originally proposed by Alva, and the design of which he sketched with such a degree of accuracy, that we must honor him as a man of genius, while we condemn him, as a tyrant. Whether England could have made any resistance had Philip II. been able to accomplish this plan, may reasonably be doubted:—According to Alva, the fleet was to have numbered 150 ships of the line (the real Armada consisting, as we have seen, of but 65); their tonnage would have been 77,250 tons. In addition to these ships of the line, there were also to have sailed 446 frigates, transports, and small vessels, with the tonnage of 33,500 tons; so that the whole tonnage amounted to 110,750 tons. The crews were estimated at 30,100, whose pay for eight months was to be 500,000 piasters. The land troops were to have amounted to 55,000 men. Let us only consider the times in which this was to have taken place. Even in our own days the largest fleet scarcely lands more than 20,000 men. The expedition which was in 1820 to have subjected South America, consisted of only 15,000 men. Spain, Naples, and Germany, joined to form this formidable array. On landing, it was to have had an artillery of 136 pieces of cannon, that of the fleet numbering 4,150† pieces. The service of the land artillery was reckoned at 28,000 cannon-balls, and 2,200,800 cwt. of powder. In those times, compared with our own, the guns were fired slowly and seldom, so that the ammunition seems but slenderly

* 5175 cwt. of powder is manifestly too little, while on the other hand, 2,200,800 is as plainly too much.

† 4150 pieces of cannon are far too few for 150 ships of the line, and 446 frigates; for if we reckon that each ship of the line carried at least 50 guns, they would have amounted to 7500; to which we may add 200 frigates at 20 guns each, giving 4000 more, making an aggregate of 11,500 guns.

provided. For the conveyance of the artillery when landed, Alva intended to ship 1400 mules; the rest of the service was to be supplied by 1200 horses.—The whole number of men on board the Armada would have amounted to 94,000. We cannot proceed farther with the items; but what we have already stated is sufficient to show the enormous scale, for the times, in which the expedition was planned. The original document containing this plan, was lately, and, we believe, for the first time, published in Spanish and German in Schepeler's *Beitragen zur Geschichte Spaniens*. He obtained it, and other ancient papers, in 1814, while serving in Spain.

THE OLD MAN'S RELICS.

I have been young, and wild, and gay,
To all but beauty blind:
And sighed all night, and sung all day,
To ladies stern or kind;
I've told my tale in manly prose,
I've written it in rhyme;
And now I'm crown'd with age's snows,
The scent of yonder withered rose
Recalls that pleasant time.
O then were hopes that chased my sleep,
And fears that made me thin;
And many subtle wiles and deep
My proud one's heart to win;
And raptures past the poet's guess
To wear so sweet a chain;
And now, perforce, content with less,
A gleam from yonder golden trees
Revives it all again.
O then were feasts in lighted halls,
And vows beneath the moon,
And fairy tales and madrigals
In garden bowers at noon;
And wanderings with my ladye love
Around the haunted hill;
And now my hand can hardly move,
It needs but touch the brodered glove,
And she's beside me still.
You smile at all these simple things
I hold in treasured store;
You ask the worth of flowers and rings
When love exists no more;
I wish to-morrow were my last,
If cold or careless grown,
To flame or wind I dared to cast
The precious relics of the past.
And joys for ever gone!

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.
Leveling Instruments, large and small sizes, with high magnifying powers with planes made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street,
corner of Maiden-lane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new; among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy;—also, a Railroad Goniometer, with two Telescopes;—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.
WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use of the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department. Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable. I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later al angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1853.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.
Germantown, February, 1853.
For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
German and Norristown Railroad

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 18 11

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 58 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1853.
To Messrs Ewing and Heartte.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any persons desirous of pursuing the same.

The schr. Manuelita, which was captured by the Nimble, Br. schr. of war, and sent into Havana, was supposed to be the fastest sailing slave out of the port, having been chased a number of times by cruisers, and escaped. She was 102 ft. 6 inches on deck, 24 9 beam, and drew 17 feet water. Crew amounted to 34. Her safety was so confidently anticipated, that a great part of her cargo (had 185 negroes when taken) were sold previous to her arrival.

Disaster.—The ship Montpelier, from New Orleans for this port, went ashore at Squam Beach, 15 miles north of Barnegat, on Tuesday morning, at 4 o'clock.

The Department of State has received information from the Chargé d'Affaires of the Netherlands, announcing the total disappearance of the Asiatic Chelera from that kingdom; and expressing the desire of his government, that any restrictions which may have been laid upon ships or goods coming from thence, in consequence of the prevalence of that disease, should be taken off.

Circular to Collectors, Naval Officers and Surveyors.

TREASURY DEPARTMENT,
Comptroller's Office, Feb. 18, 1834.

Six—According to the decision of Mr. Secretary Duane, communicated in the circular from this office, dated the 12th of August, 1833, namely—that all Wines, excepting those of France, were from and after the 3d day of March, 1834, to pay one half of the duty existing at the date of the decision, and French wines were to pay half the duty to which they were subject, under the act of 14th July, 1832; all wines, whether imported before or after the 31st of December, 1833, and remaining under the control of the proper officers of the Customs, after the 4th day of March, 1834, will, in conformity with the provisions of the 3d section of the act of 2d March, 1833, entitled "An act to explain and amend the 18th section of an Act, to alter and amend the several acts imposing duties on imports, approved the 14th July, 1832," be entitled to the reduction of one half the duties respectively specified in that circular, in relation to which reduction the third section of the said Act of 2d March, 1833, contains the following directions, namely:

"If any higher duty shall have been paid, such excess shall be refunded out of any money in the Treasury not otherwise appropriated, to the person placing the same in the custody of the Customs; and any outstanding bond or bonds, which may have been given for the duties on the same shall be cancelled."

In order that there may not be any misunderstanding, however, in relation to the Wines which have been imported since the 31st December, 1833, and which may remain under the control of the proper officers of the Customs, after the 4th March, 1834, it is deemed proper to state that, in case the duties on any Wines thus imported, exceed 20 per cent on the value, they will not, besides the reduction of one half of the duties already allowed, be also entitled to a deduction of the one-tenth part of such excess.

With a view to an uniformity of practice in the execution of the laws referred to, it is deemed proper to state that the reduction is, in all cases, to be made with reference to the amount actually paid or secured on the quantity as ascertained at the time of the deposit.

In those cases in which the whole of the duties shall have been paid before 4th March next, a Certificate is to be given by the officers of the Customs to the persons who may be entitled to the same agreeably to the subjoined form mark A, which certificate is to be presented to the Treasury for payment.

But when only a moiety of the duties shall have been so paid, as such moiety will constitute the amount of duty to which the Government will be entitled, the bond for the remaining moiety is to be cancelled; and where no part of the duties shall have become due and payable before wines shall be applied for to be withdrawn from the Custom House stores after the 4th March next, you are to take bonds with sureties to your satisfaction (provided the party has no bond due and unsatisfied) payable in three and six months after date of importation, calculating the duties at the rates which will be in force after that day.

It is deemed proper to add that a certificate agreeably to form A, is in no case to be issued to the party claiming it, if any debt he may owe to the Government be due and unsatisfied at the time.

All such cases are to be reported to the Department, and thereupon special instruction in relation to them will be given.

In the views thus communicated, the Secretary of the Treasury concurs. Respectfully,
Signed, Jos. ANDERSON, Comptroller.

BANK OF THE UNITED STATES,
March 5, 1834.

At a meeting of the Board of Directors held this day, Mr. Eyre, from the Committee on the Offices, presented the following report, which was read.

REPORT.

The Committee on the Offices having now ascertained by an experience of several months, the progress in the reductions in the business of the Bank, ordered by the Bank on the 8th of October last, avail themselves of the monthly returns from the Bank and all its offices, made up for the month of March, to present a statement of those reductions.

The design of the Board in directing them, was to protect the institution, and to provide the means of paying the Deposites of the Government, so as to press with as little injury as possible on the community. How far that purpose has been accomplished, will be seen from the following statement of the amount of loans, deposites, specie, and circulation of the Bank; from the 1st of October, 1833, to the 1st of March, 1834.

	Discount.	Dom. Bills.	Total.	Pub. Deposites.	Specie.	Circulation.
1833-Oct. 1	49,396 97 5	49,117 967 97	51,600,000 99 5	8,998,435 58	8,008,882 78	17,877,989 36
Nov. 1	1,069,812 94	1,617,750 41	2,687,563 35	8,998,435 58	8,008,882 78	17,877,989 36
Dec. 1	1,280,557 49	1,617,750 41	2,898,307 90	8,998,435 58	8,008,882 78	17,877,989 36
1834-Jan. 1	1,380,000 00	1,617,750 41	2,997,750 41	8,998,435 58	8,008,882 78	17,877,989 36
Feb. 1	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
Mar. 1	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
From this statement it will be perceived that from the 1st of October to the 1st of March, the total reduction in the loans, discount, was.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
While there has been an increase in the Domestic Bills of.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
Making the total reduction of Loans.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
During the same period, the reduction of the Public Deposits was.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
And of the Private Deposits.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
Making a total reduction of Deposites.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
During the same period, the specie of the Bank has diminished.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
And the circulation of the Bank.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
The comparison of the two periods will be more obvious, from the following tabular statement:	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
October 1, 1833.....	49,396 97 5	49,117 967 97	51,600,000 99 5	8,998,435 58	8,008,882 78	17,877,989 36
March 1, 1834.....	1,574,522 89	1,617,750 41	3,192,273 30	8,998,435 58	8,008,882 78	17,877,989 36
Loans.....	3,998,373 07		7,996,746 14			
Deposites.....				17,877,989 36		
Specie.....				8,008,882 78		
Circulation.....				10,063,441 51		
Discount.....				1,574,522 89		
Total.....				373,602 36		

The general result of the operations of the Bank during the last five months, have been,

1st. That the reduction of the loans has not been by upwards of four millions of dollars as great as the reduction of the deposites—and

2d. That the withdrawal of nearly eight millions of dollars, of those funds on which the Bank had based its accommodations to the community, has not yet been followed by a reduction of accommodations equal to one half of the amount of funds thus withdrawn.

3d. That from the 1st of January to the 1st of March, the increase in the loans of domestic bills amounted to nearly two millions and a half of dollars.

4th. That during the same period there has been an actual increase in the total loans of the Bank of \$1,256,368 16.

The Committee cannot regret the smallness of this reduction during the last five months, not even the actual increase of its loans since the first of January; because both have arisen from the strong desire of the Bank to give every relief to the community consistent with its own safety. But they cannot forbear to express their deliberate conviction, that these reductions are much less than are required for its security during the present unsettled state of the currency, and that it has now become the duty of the

Bank, gently, but steadily to diminish the amount of the claims upon it, by continuing to lessen its business.

Whereupon, on motion of Mr. Newkirk, the following resolution was unanimously adopted:

Resolved, that as much misapprehension appears to exist throughout the country, in regard to the reduction of the loans of the Bank since the removal of the public deposites, the foregoing report, be published for general information.

Extract from the minutes.

do.	800	do.	2 1/2	do.	do.

soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 772 of this Journal.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MARCH 15, 1834.

TO CORRESPONDENTS.—Our friends will not, we trust, withhold their valuable communications, because they are sometimes delayed. They must recollect that the times are 'out of joint,' and that we have other duties to attend to just now.

We are gratified to learn that the **ITHACA AND OWEGO RAILROAD** will probably be in use by the middle of April, through its *whole line*.

ENGINEER'S MANUAL.—We publish the following extract from the preface of a forthcoming work, believing that in so doing we shall confer a favor on many of our readers. The author of the work is a practical engineer, engaged upon one of our western railroads, and has often furnished us with valuable communications for the Journal, signed "V. D. G." We hope to be able to make further extracts from the work itself, by which those most interested in it may be able to judge of its utility to the profession.

In presenting the present little work to the notice of the public, the author is actuated with the hope of contributing in a small degree to the collection of such principles as are daily required in locating railroad curvatures with ease, accuracy, and despatch. The author has not possessed an opportunity of ascertaining extensively what may be the various methods of calculation at present resorted to by scientific and skillful engineers generally, in determining the relative positions of given points in the different curves and tangent lines which frequently come under consideration in the field; and the principal formulas which are here offered to the public, embracing these

cases, are therefore *such only* as have been used with advantage by himself. The only methods of calculation which he knows to be *now in use by others*, and which are sufficiently commodious for purposes in the field, are of an approximative kind; and under circumstances which often occur, the use of those approximative results is attended with inconvenience and delay. It is therefore hoped that the different formulæ which will be here found investigated and arranged for use will be acceptable to those who may not be in possession of more convenient methods of computation, which are sufficiently rigorous to pass a *long curve* through a given point at the first attempt.

The second part of this Manual is devoted to the methods of constructing the elliptical curve. It is well known that the true curve of an ellipsis is produced by an oblique section of a cylindrical surface, whether that surface be circular or elliptical; and hence it is that the true figure of an ellipsis should be traced with precision in the construction of skew bridges, having either circular or elliptical arches. Other cases in the department of a civil engineer might be mentioned, in which a perfect ellipsis is required; and there is no method available in practice hitherto published, which is known to the author, for constructing an oval, consisting of given circular arcs, and approaching with sufficient precision to the curve of an ellipsis.

A table of natural sines and cosines is to the engineer almost of daily use. Such a table is therefore subjoined to this work. It is also thought desirable to add a table of the square and square roots of numbers; which not only very frequently saves labor, but will also be the means of diminishing the liability to err in numerical calculations. Indeed, those two tables, or others of a similar kind, will be considered indispensable to the skillful prosecution of all field operations, by those *who know* the facilities which may be derived from them.

A speed of 40 miles an hour with a light load, has been obtained upon the Manchester railway; and Mr. G. Stephenson, the engineer, has stated his opinion that an engine might be constructed to run 100 miles within the hour, although he acknowledges that "at that rapidity of motion the resistance of the atmosphere would be very considerable." Engines are now made with eight times the power of the Rocket, yet with little more weight resting on each rail, the load being equally divided upon six wheels, and the machinery placed in a more advantageous situation than formerly. The tubes of the boiler are made smaller and more numerous, and of brass instead of copper. The last engine put on the railway ran 23,000 miles with the most trivial repairs, taking every day four or five journeys of thirty miles each.

The following communication was received in due time, but delayed by a press of other matter previously in hand.—[Ed. R. R. J.]

Internal Improvements, No. IV. By F. To the Editor of the American Railroad Journal and Advocate of Internal Improvements.

SIR,—Before taking leave of the subject of turnpike roads, we must intreat your further indulgence for a few moments, to make a brief reply and offer a few remarks in relation to an objection that has been frequently advanced against the indiscriminate adoption of M'Adam's system of construction. It may be true, as has been stated, that there are spots highly favored in themselves as to natural advantages,—rich in every mineral and agricultural resource—but at the same time so sequestered and shut out beyond the pale of intercourse with more populous parts of the country, as to render them unavailable, except to a very limited extent. Capitalists, however, cannot be induced to embark in projects that offer but little promise of profit, and that little uncertain and remote. They require something more tangible, and will not seek in distant quarters for that which they may have without seeking at home; and it therefore stands to reason, that so long as safer and more advantageous investments are to be met with here by greater facilities, such places, however strong their claim to notice may be, must of necessity remain in a state of crude, uncultivated nature, or be content with such modifications of approved plans as may be in some degree commensurate with their available means.

We are no friends to the forcing system, and would at any time use our best efforts to discourage any project having a tendency to that end; but, we still think that some substitute might be safely recommended to meet such cases as those alluded to above, without in any manner compromising the great end of Internal Improvements, which is to bring out to the best advantage the resources of a country by any means that the nature and extent of those resources will justify. If a substitute be adopted, it should combine in its qualifications a hard and even surface, with great cheapness of construction. These are qualities indispensably necessary to the furtherance of the end in view—and as they seem to be embodied in a plan recently proposed by an engineer of some eminence in Ohio, we shall content ourselves in referring to a former number of this journal for a full explanation of its principles, by observing that much depends upon the quality and seasoning of the timber used in the formation of the ways. Evaporation principally takes place in the direction of the fibres of the wood;

and the juxtaposition of the parts where green timber is used must therefore prevent the whole escape of the natural juices. Decay, under these circumstances, is soon engendered, and the durability of the road thereby materially affected. The originality and real merit of the plan, however, recommend it warmly to notice; and, as applicable to the cases alluded to above, where preliminary measures are necessary to the introduction of more perfect means, it is particularly deserving of attention. For the end ever to be kept in view in the introduction of all improvements and innovations, should be the best interest of the particular section of country through which it may pass; and to this effect such measures only should be adopted as a calm and deliberate examination of its condition, with a careful investigation of its capacity of improvement, may dictate as most conducive to the speedy development of its natural resources. It will be admitted that every district possesses certain capabilities, which are only prevented from being brought into action by its distance from some sea-port town; and that every place having a tendency to increase its facilities of intercourse therewith must exercise a corresponding influence on the improvement of its condition. It is still, however, of vital importance to the early and successful establishment of prosperity, that the infantine exertions of such district be carefully fostered and guarded against all undue encroachments—thus, an avenue being laid open, no further apprehension need be entertained. A change of condition will soon be manifested by increased activity and prosperity; and its necessities will thenceforth be promptly met by additional facilities: for, as the motive that first incites to action stimulates with greater force to perseverance, so the enjoyment of increased prosperity animates to still greater exertions for its consummation.

As civilization attains a higher degree of perfection, and commerce becomes more generally extended, the luxuries and comforts of life demand the adoption of some new mode of communication more suitable to the advanced state of the arts and manufactures. Railroads and canals thence took their rise; and all countries to which ancient history directs our attention, seem to have availed of them according as necessity has dictated or circumstances justified. Indeed, it is a remarkable fact, that the only countries which have never emerged from their primitive state of barbarism and ignorance are those which are destitute of the means of inland navigation. This is strikingly exemplified in the inland parts of Africa, and in that part of Asia lying north of the Euxine and Caspian—the ancient Scythia and the modern Tartary and Siberia. On the other hand, wherever these means have been enjoyed, there civilization has prospered, and the arts and sciences have flourished. Thus, Egypt was the birth-place of agriculture and manufactures—the banks of the Nile were the sites of its towns and villages, which, together with those of the ancient Indians and Chinese, derived their prosperous condition and immense wealth almost exclusively from their inland navigation.

The experience of past ages therefore proves to us that every means, having for its end the promotion of internal commerce, is deserving the consideration of all civilized communities, and particularly of one like our own, in the enjoyment of every variety of soil and climate, and capable of every species of production, either of agriculture or manufactures. The system of society is so complex in its character, and its various orders so mutually interwoven by natural causes, that a good effect cannot be produced in any one part without exercising a corresponding happy influence over the other; generating thereby a mutual dependence among all classes—the high, the low—the rich, the poor—the agriculturist, the manufacturer. The interests of each converge towards the same point; and it should, therefore, be the duty of each, collectively and individually, to concentrate

their energies, and unite their efforts, to the accomplishment of the same great end. Once establish a mutual interchange of the different products of industry, by facilitating the means of intercourse between distant places, and the very objects of that industry thence become more varied, and the general commerce of the country less liable to interruption from the effects of artificial causes; and the action of any particular calamity, to which every society in its social character is more or less exposed, would thence produce but a temporary and partial evil, and would find its own correction in the reaction produced by a continuation of the exciting cause.

These remarks will not, of course, apply to a country exclusively possessing agricultural industry. In such country, the influence of foreign competition on its peculiar staples exercises a direct tendency to stimulate production to an extent that is calculated to overstock and glut the market. The price of the article thence becomes insufficient to meet the expense of raising it; and the cultivator, as a consequence, unless speedily relieved by the introduction either of new staples or new markets of consumption, must sooner or later sink under the pressure, and be reduced to the lowest state of poverty. A most deplorable instance of this truth has already been experienced in some of the Southern States of this Union—where the very articles that, for many years, proved a fertile source of revenue to the cultivator, became, not long since, owing to an excessive production, so reduced in value as to be altogether inadequate to the task of maintaining him above actual want.

But, however palpable the causes by which these effects are produced may appear, it is still a prolific source of speculation among philanthropists how far the rapid extension of manufactures, through the medium of machinery and internal improvements, is advantageous to a country as regards its moral and social condition. It has been observed, and cannot be denied, that every improvement in machinery, by which manual labor is materially lessened, is calculated to produce distress with a certain class of the community, by depriving them of their usual means of employment, and obliging them thereby to recommence the world, so to speak, in the adoption of some new vocation. But, at the same time, it must be remembered that the direct tendency of the operation of any improvement of this kind, is to increase the consumption of the product of its labors by lessening its nominal value. A wider field is thus at once opened to enterprise—additional resources made attainable,—and, therefore, while the evil complained of is only temporary, and confined to a limited, a very insignificant, numerical portion of that community, the benefit conferred is permanent and diffused throughout the whole mass of society. Besides, what tends more to elevate the condition of the poor—to exalt and ennoble the character of man—than the encouragement of all such means as will supersede the necessity for application of mere animal force? It is the degrading tendency of his occupation which alone reduces the poor operator to the lowest grade of human depravity—hardens his conscience—and stifles in his breast every natural feeling of moral excellence. Relieve his mind from this sense of degradation, and his ambition will soon take a loftier flight. He will feel a superiority over the brute creation that will elevate him above his former sphere and urge him on to greater efforts. The faculties of mind thus awakened will be thenceforth directed to the accomplishment of those means of luxury and enjoyment that before were only attainable at unceasing toil and labor.

It is unnecessary to pursue this subject further; for it is obvious that every improvement in machinery must be attended by results highly beneficial to the community at large; and internal communications, as a step preliminary to their introduction and application, should engage a large share of attention from

every well wisher to his country. Let every channel, therefore, through which information on the subject can be derived, be opened to public inspection; let its sources be examined with a view to the general good; and let its stream flow pure and unadulterated by the poison which has hitherto polluted it, and we then hazard nothing in the assertion that, under its genial influence, the arts of peace will be cherished and commercial reciprocities cultivated. F.

New-York, February 8, 1834.

The late Experiments made on the Liverpool and Manchester Railway, to determine the accuracy of the Undulating Railway Theory. [From the London Mechanics' Magazine.]

SIR,—The truth of Mr. Badnall's statements of the experiments on the Sutton inclined plane being of importance to those who have no other means of forming their judgment upon the undulating railway theory, I take the liberty of asking that gentleman, through the medium of your Journal, which contains his account of the trials on the 23d and 24th of September (see No. 530,) how it happens that your printed statement doth vary from the verbal one which he was so polite as to give me at the Star hotel, Liverpool, on the evening of the said 24th, in the presence of Mr. Perkins the engineer, and several other gentlemen? Mr. Badnall read from his note-book, carefully and distinctly, while I wrote down his words (in ink), which, at my request, were repeated by him to prevent mistakes, and I have now the memorandum before me. Mr. Badnall will recollect, that I told him *the same night* that the results did not accord with each other, if the inclination of that part of the Sutton plane, upon which the experiments were tried, was really as great as he had assumed it to be—namely, 1 in 96.

The statement which Mr. Badnall then deliberately gave me was as follows, and refers only to the first, second, and eleventh experiments:

“Weight of the Rocket engine and tender, 6½ tons; wheels 4 feet 9 inches diameter. First.—Began the ascent (without steam) at the rate of 18 miles an hour (equal to 18 strokes of the piston in 10 seconds), and ran up the inclined plane to a distance of 217 yards, by momentum. Second.—Returned to the foot of the inclined plane (using the full power of the engine), and acquired a velocity of 22 miles an hour (or 22 strokes of the piston in 10 seconds); shut off the steam, and ran, on the level plane, to a distance of 454 yards, by momentum. Eleventh.—Two engines took a load of 35 tons on the level, and reached the foot of the inclined plane with a velocity of 12 miles an hour (or 12 strokes of the piston in 10 seconds). One of the engines being left behind, the other (the Rocket) shut off the steam, and ascended a space of 177 yards, by momentum.”

The statement with regard to the last experiment, it will be seen, agrees with your printed account; but the two first do not, as to the fact of the acquired velocity; yet it is a truth which Mr. Badnall will not deny, that I at first understood him to say “twenty to twenty-two miles an hour; but, upon my repeating those words, thinking the expression too vague, he corrected me or himself by saying, “twenty-two precisely.” I feel sorry for the necessity of calling upon Mr. Badnall to explain how it was that, four days afterwards, he should send you so different an account for publication. Did he mean to deceive me, or your readers? In either case, I opine, he will be considered as having rather too much of “the man of the world” in his composition. I should have taken this step before now, had I seen the paper in No. 530 sooner; but I did not get it till the 2d inst. in the last monthly part, and have since then been closely engaged in my regular vocation.

Being desirous of finding out the error, for I felt assured of its existence, and Mr. Badnall hav-

ing returned to the Isle of Man, I wrote to Mr. Booth on the subject, of which letter the following is a copy:

"SIR,—Having been invited by Mr. Badnall to witness the experiments on the Sutton plane on Tuesday, the 24th ult., I went there on that day, but, as you will probably recollect, was too late for personal observation; for, at the moment I arrived, the Rocket engine had received some damage, and Mr. Badnall, with yourself, was on the point of returning to Liv-

erpool by the same train. Mr. Badnall gave me the principal results on our arrival at his hotel in Liverpool, which I cannot at all reconcile, upon the supposition that the inclination of *that part* of the Sutton plane is 1 in 96. Perhaps the quarter-mile post which you assumed as the *foot* of the plane is not precisely so, or some alteration may have taken place since their first construction. If accurate levels are taken, I am inclined to think the section will be found as follows:

"Should you think it necessary to have actual levels taken for the purpose of corroborating the other facts, will you have the goodness to favor me with the result? And you will further oblige by informing me when you next try experiments with reference to the undulating theory, and by allowing me to be present during the trial. I am, sir, your obedient servant,

H. S.

Sheffield, Oct. 1, 1833."

"*Postscript.*—I ventured to tell Mr. Badnall on the same evening, that there must be some material error, and that I thought it was in the assumption of 1 in 96 for the inclination. This well-meant observation, however, did not appear very palatable."

"To Henry Booth, Esq., Treasurer to the Liverpool and Manchester Railway Company."

It is to be regretted, for the sake of truth, and Mr. Booth's acknowledged character as a gentleman and a lover of science, that all the notice of this communication which I have had the honor to receive, is contained in a postscript of an unlooked-for letter from Mr. Badnall, dated October 19th. He says,—“Your letter to Mr. Booth may lead you to a better acquaintance with the precise inclination of the Sutton inclined plane; but, however the inclination may vary from the reputed rise, it cannot affect the proportionate result of experiments.” True, it cannot; but it affords the means of *checking* the statement of Mr. Badnall; and there would have been another check, if that had been done which on the 24th September I said ought to have been done, namely, accurate observations recorded of the *length of time* occupied in traversing the respective spaces by means of the acquired *momenta*. This hint, it appears, has not been forgotten in trying the subsequent experiments, and its being acted upon may be attributed to Mr. Robert Stephenson, of Pendleton, who perfectly agreed with me in opinion as to its propriety. [See *Liverpool Mercury* of October 18.]

As soon as I am more at leisure I shall send you some further ideas on the undulating railway theory, which I will endeavor to condense as much as possible, and will not forget the friendly notices of your correspondents “Junius Redivivus” and “S. Y.” Yours, respectfully,

HENRY SANDERSON.

Sheffield, Nov. 10, 1833.

Mr. Badnall's Explanation of the Alleged Discrepancies in the Reports of the Recent Experiments on the Liverpool and Manchester Railway, to determine the correctness of the Undulating Railway Theory. [From the *London Mechanics' Magazine*.]

SIR,—I feel indebted by the opportunity you have afforded me of explaining the cause of the difference between the statements alluded to by Mr. Sanderson, and those sent by me to you for publication. I have no doubt that Mr. Sanderson copied my observations correctly; and those observations, at the time I communicated them to him, I believed to be perfectly correct. Mr. Sanderson is aware that, on the day the experiments were tried, I was laboring under severe indisposition; and, as the weather was extremely inclement, I did not take the same active part in the experi-

ments as Mr. Booth, Mr. Rae, and Mr. Scott. The observations I made, as they appear in my note-book, in regard to the velocity of the engine and train at the foot of the ascent, were founded on my own calculation of the number of strokes which the engine appeared to be working when she passed the spot on which I stood. The spaces passed over were measured, and the particulars agree with the statement which I gave to Mr. Sanderson. Immediately after the experiments were concluded I proceeded to Liverpool with Mr. Sanderson, whom I met in one of the railway carriages; and the same evening I gave him the particulars to which he alludes. He will perfectly recollect that the following day I was not, through indisposition, able to get up till one o'clock; and, having an arrangement at Manchester, I could not, on that day, compare my notes with Mr. Booth's. At two o'clock I left for Manchester, and gave, at Newton, the same particulars which I had given to Mr. Sanderson to Mr. Allcard. On the 28th of September I left Mr. Sanderson in Manchester, and returned to Liverpool; and, previously to addressing you, I considered it better to have an interview with Mr. Booth, who was in possession of the notes taken by Mr. Rae and Mr. Scott, and who had himself carefully taken down all the particulars. At this interview I found that I had over-estimated the velocity at which the piston was moving; and the statements, therefore, which I sent to you were *not my own*, as given to Mr. Sanderson, but those of three other individuals, which decidedly told more *against my principle* than *my own* would have done.

For instance, had the engine been travelling at eighteen miles an hour at the foot of ascent, before rising the hill, and twenty-two miles an hour at the same point, after descending the hill, which are the particulars given to Mr. Sanderson, the result would have shown a greater gain by the undulating system than when the velocities were fifteen strokes of the piston (or about fifteen miles an hour) before ascending, and sixteen strokes of the piston (about sixteen miles an hour) after descending, as published in your Magazine.

I have only to add, that in all the statements of the experiments which I *have sent to you*, I have cautiously avoided laying myself open to the slightest charge of error or partiality. On the contrary, my notes have always been corrected by, and compared with, the notes of others.

With regard to the particular inclination of the Sutton inclined plane, it has always been understood to be about one in ninety-six. After my first experiments were made, however, the levels were taken afresh, and it was found, that towards the foot of the plane the inclination was considerably less than the average rise. For instance, from the point from which the ascent of the Rocket engine, &c. was calculated, the plane rises as follows:

1st	88 yards,	- - - - -	1 in 122.
2d	do.	- - - - -	1 in 105.
3d	do.	- - - - -	1 in 97.
4th	do.	- - - - -	1 in 94.
5th	do.	- - - - -	1 in 92.
6th	do.	- - - - -	1 in 89.
7th	do.	- - - - -	1 in 89.

And the entire distance here denoted exceeds

that to which, in any of the experiments, the train ascended.

It must, however, be evident, that however a variation in the inclinations may affect Mr. Sanderson's calculations, it cannot possibly,—which he will, no doubt, allow,—affect the comparative results of the experiments.

I remain, sir, yours, &c.,

RICHARD BADNALL.

Farm-hill, near Douglas, Nov. 19, 1833.

N. B.—There can be no doubt as to the measurement of time being the best test; which test was adopted in all the subsequent experiments, as agreed upon by the engineers present.

[From the *Mechanics' Magazine*.]

ERICSSON'S CALORIC ENGINE.—In our number for December we promised a description of Mr. Ericsson's Caloric Engine as soon as it could be procured. We have much satisfaction in being thus early able to redeem that pledge. The following is from the *London Mechanics' Magazine*:

The susceptibility for heat, possessed by gaseous and fluid bodies, is known to be nearly unlimited. Neither density nor pressure seems to exercise the smallest counteracting influence. The densest medium will take up a given quantity of heat with as much facility as the rarest; and when two mediums of unequal temperatures are brought in contact, they become equalized immediately, no matter how different their densities may be.

We have now to direct the attention of our readers to a mode of applying these physical truths to the production of mechanical power, which seems to us to be not only decidedly novel, but to be fraught with results of the greatest public importance.

We allude to the patent recently taken out by Mr. Ericsson, for what he calls his “Caloric Engine.” The grand feature by which this engine is distinguished from the steam engine, and all other power machines, is this, that the same given quantity of heat which sets it in motion is used over and over again to keep up that motion, and that no additional supply is wanted beyond what is requisite to compensate for a small loss incurred by escape and radiation.

We have seen, as well as hundreds of others, during the past week, an engine constructed on this plan actually at work, and can bear our personal testimony to its working as powerfully and equably as any steam engine could do.

The engine which we saw at work is, in all external respects, saving only the small space which it occupies, exactly similar to a high pressure steam engine. It is calculated to be of five horse power. There are two cylinders: one called the cold cylinder, 10½ inches in diameter, and the other the working cylinder, 14 inches in diameter, both with an 18 inch stroke. The engine was worked under a pressure of 35 lbs. to the square inch, and its power checked by a break, loaded with 4,000 lbs., acting on the circumference of a wheel of 2 feet diameter.

The circulating medium employed in this engine is simply atmospheric air; but of course that or any other fluid medium may be employed with equal facility for the purpose of using the heat over and over again—some perhaps with much greater facility.

To describe the interior arrangements, by which motion is given to the engine, would lead us into a multiplicity of details, not at all necessary for the comprehension of the

principle of its action. All that is needful for this purpose the reader will find in the simplified diagrammatic arrangement exhibited in the prefixed engraving.

D D is a cylindrical vessel termed the "regenerator," which, in the actual engine, is 7 feet 6 inches long, and 8½ inches in diameter, fitted with small tubes, which pass through both ends, and terminate in the caps H and J. It also contains a number of division plates, through which these tubes pass, and which plates have segments cut out alternately from their tops and bottoms. The tubes themselves likewise contain a number of small divisions, tapering off towards the centre, each placed in an opposite direction to the other. T T is one of a series of bent tubes, inclosed in a stove, E, and acted upon by the fire, U, the combustion being supported by the draft produced by a chimney, R. The pipes in the stove are all connected with two larger pipes, the one of which communicates with the cap, H, and the other, as shown by the diagram, communicates with a four-way cock, attached to the passage-pieces of a cylinder, A, which is the working cylinder of the engine. P represents one or more pipes, exposed to some cooling medium, and is termed the "cooler;" it contains also a number of division plates, similar to those in the tubes of the regenerator, as also with the four-way cock attached to the cylinder K.

The whole of the apparatus, namely, the body of the regenerator, its tubes, the caps H and J, the pipes in the stove, the cooler P, pipe G, and the two cylinders, with their passage-pieces, we will now suppose to be all charged with common air, or any other æriform substance. We will suppose also that the portion of that air which is marked black in the diagram is kept under greater pressure or more compressed than the rest, which is left blank. Let us suppose farther, that the air which the cylinder A, the stove pipes T, the cap H, and the pipe G, contain, is raised to some considerable temperature, and that the air contained in the body, as well as the air in the tubes of the regenerator, is nearly of the same temperature of that

nearest to the cap H, gradually lessening towards the cap J, so as to be there of an equal temperature with the surrounding atmosphere. Now, since that portion of the air contained in the apparatus which is marked black has been changed to a greater pressure than the rest, and as the cylinder A, with its piston, is larger than the cylinder K, with its piston, it follows that motion must be produced in the direction shown by the arrow marked on the crank L.

The force thus exerted will, of course, depend on the difference of the areas of the pistons, and on the difference in pressure given to the circulating medium. It is evident that the hot air, which, by the motion of the piston, must escape from the cylinder A through the pipe G, will, in its winding passage through the body of the regenerator towards the cooler P, give out its heat to the cold air forced from the cylinder K, the particles of the latter being also in a constant state of change in passing through the tubes towards the stove pipes. The pistons having performed the full stroke, the two four-way cocks are then reversed, when a retrograde action takes place; the motion of the opposite currents in the regenerator still continuing the same as before. A constant motion will thus be produced, and a constant transfer of heat kept up. The object of the cooler P is to abstract the heat, which, on account of the different capacities for heat of the two currents, is not taken up in the regenerator, and the object of the stove is to supply the heat thus carried away, as well as to compensate for losses by radiation, and to raise the temperature at the commencement.

It need hardly be stated that the lesser volume of air coming from the cold cylinder fills the larger space in the hot cylinder, because it gets heated in passing through the regenerator and through the stove; while on the other hand, the larger escaping volume from the hot cylinder finds room in the lesser space of the cold cylinder, because it parts with its heat before getting there.

By charging the apparatus, the circulating medium may, of course, be kept under any desirable pressure, and thus the power

of the engine varied at pleasure. High pressure will naturally produce the greatest proportionate effect, the loss by radiation being the same under whatever pressure.

We were anxious to satisfy ourselves as to the equality of the action of the engine, and with this view timed it repeatedly: the number of strokes was regularly 56 per minute.

The total consumption of fuel, when the engine is working at this rate, is stated to be no more than two pounds per horse power in the hour; and the entire loss of heat incurred by the transferring process (that is, the whole heat carried away by the cooler,) is estimated not to exceed the product of 3 lbs. of fuel per hour. That the fuel required is not even less than two pounds, is solely owing to the great radiating surfaces unavoidable in an engine on a small scale, and to these radiating surfaces not having in the trial engine been covered by any non-conducting substances.

Mr. Ericsson has published a pamphlet explanatory of the principle and construction of his caloric engine. We extract from it the following additional information:

"By keeping the pipes in the regenerator so charged with air as to support a column of mercury 56 inches high, the greatest effect is produced in the trial engine. By the manner in which the side-valves are worked, the pressure in the body of the regenerator always adjusts itself, so as to support a column of mercury 18 inches high; so that an effective pressure, equal to 38 inches of mercury, is kept up. A break, well oiled and loaded, with 5,000 lbs. weight acting on the circumference of a wheel of two feet diameter, fixed on the fly wheel shaft, will at the above pressure keep the speed of the engine at 55 revolutions per minute. At this speed, 176 cubic feet of heated air, of a mean pressure of 17 lbs. to the square inch, are admitted into the working cylinder per minute, thereby exerting a force equal to 431,970 lbs. moved through the space of one foot: thus $\frac{431,970}{33,000} = 13$ horses' power are communicated to the main crank of the engine. The estimating this power is, however, of no other use than to give an idea of the amount of friction to which the crank-engine is subjected. In the same space of time, or a minute, 94.6 cubic feet of cold air, of a mean resistance of 14 lbs. to the square inch, are forced or put into circulation by the cold cylinder, and equal to a resistance of 190,575 lbs. moved through the space of one foot. This amount, divided by 33,000, will give 5.7 horses' power required to work the cold cylinder—hence the two cranks give and receive the power of upwards of 18 horses. By communicating the power of the hot cylinder to the cold cylinder in a direct manner, the available power, setting frictions aside, would be $431,970 - 190,575 = 241,395$ lbs. moved through the space of one foot. This is equal to $\frac{241,395}{33,000} = 7.3$ horses' power—deducting 2.3 horses for frictions would leave 5 horses. On these grounds the trial engine has been estimated at 5 horses' power. The transferring process has succeeded to such an extent, that out of the 10 lbs. of fuel which the engine consumes per hour, the product of heat from 3 lbs. of fuel only are wasted or carried away by the cooler. This important fact has been ascertained by immersing the cooler in a cistern containing precisely 1081 lbs. of water, and by observing the elevation of temperature

after an hour's work of the engine; and the increase of temperature in that time is not quite 20 degrees—one pound's weight of fuel being capable of raising the temperature of 9,000 lbs. of water, it follows that the 1081 lbs. contained in the cistern would be raised 8.3 degrees by the combustion of 1 lb. of fuel, and hence that the actual increase of 20 degrees of temperature is effected by the combustion of less than 3 lbs. of fuel. The great discrepancy between the quantity of fuel thus wasted, and that actually consumed by the engine, must be accounted for by the fact, that a considerable extent of radiating surfaces are exposed to the cooling influence of the atmosphere without being surrounded by any imperfect conductors."

[FROM THE NEW YORK AMERICAN.]

Ithaca and Owego Railroad Company.—It will gratify the holders of the Stock of this Company to learn that there is now every reason to expect that the whole road will be ready for use, by the middle of next month. As very little if any authentic information has been given on the subject of the prospective revenue of the Company; we take the liberty of supplying the deficiency, by giving the following extract from the speech of the Hon. Charles Humphrey, in the debate on the subject of the Tompkins County Bank.

I will not trespass upon the indulgence of the House, by entering minutely into a detail of the various production of the surrounding country, which find a market at Ithaca. As some of the leading articles besides lumber, I may mention between three and four hundred thousand dollars worth of wheat and flour; between three and four hundred tons of butter; large quantities of pork; coarse grains, &c. which were exported by way of the Erie canal the last year. And notwithstanding the exports, from seven hundred to a thousand laborers, in addition to the ordinary inhabitants of the county, many of them with families, were supplied during the same period with provisions at this market; and large quantities were transported to the south and east by land carriage. I also find among my statements, derived from sources entirely to be relied upon, live stock sent from the country, to more than \$150,000 in value; cotton and woollen goods to more than \$100,000; between 2 and 300 tons of ashes; and several hundred tons of whiskey. The Lord only knows where this last article came from—we claim no credit for having manufactured it. There were from seventy to one hundred canal boats employed in the commerce of the county for the last year, of the average value of \$500 each. Without going more into particulars, the exports are known to have exceeded one million five hundred thousand dollars; and the imports more than one million of dollars in value. And I am authorized from authority that admits of no doubt, to say that the commerce of the county of Tompkins pays at least one-tenth of all the tolls received upon the Erie canal, besides what finds an outlet through the Seneca Lake. Part of the town of Hector, embracing a coast upon the Seneca Lake, of about ten miles, a densely populated, fertile and delightful country, sends its produce and receives much of its imports through that Lake, and pays its tolls at the Geneva Office.

The village of Ithaca is compactly built, mostly inhabited by respectable and thriving mechanics; and almost all the various articles required by the surrounding country, are there manufactured. It has several handsome public buildings. As an evidence of its comparative importance, I can state, that on some days of each week, fifteen mails are opened and closed, five daily stages arrive and depart, beside several three times, twice, and once a-week; a steamboat also traverses the Lake daily.

The stockholders may, for themselves, judge what will be the probable receipts on a road over which a large portion of the business which pays one-tenth of the tolls of the Erie Canal will pass.

A STOCKHOLDER.

New-York, March 10th.

ANIMAL WEATHER GLASS.—In Germany there will be found, in many country houses, an amusing application of zoological know-

ledge, for the purpose of prognosticating the weather. Two frogs are kept in a glass jar, about eighteen inches in height, and six in diameter, with the depth of three or four inches of water at the bottom, and a small ladder reaching to the top of the jar. On the approach of the dry weather, the frogs mount the ladder—but when wet weather is expected, they descend into the water. These animals are of a bright green.

AMERICAN FISHERIES.—In a recent number, we gave some interesting facts relative to the American Whale Fishery, which we are pleased to learn has been well received and extensively copied. The Whale Fishery is a very important part of our national industry, but the Cod and Herring departments of our fisheries are by no means of small consequence. As early as 1504, vessels from Biscay, Bretagne, and Normandy, were employed in the Cod Fishery on the coasts of Newfoundland. In 1507, the French, Spanish, and Portuguese, had vessels in this lucrative trade. In 1615, the number of British increased to 250; those of other nations to 400. The pilgrim fathers of New-England were obliged to draw their first support from the sea, and then began from necessity, and was continued for profit. Previously to the American Revolution, the Cod Fishers of Massachusetts employed 28,000 tons of shipping and 4000 seamen. The annual value of their industry and enterprise was about 1,000,000 dollars.

The absurd restrictions by which Lord North attempted to deprive the Colonies of their fishing rights are well known, as also the indignant exclamation of Burke against such arbitrary conduct. The struggle which followed was, of course, injurious to this, as to all other branches of national industry, but with the peace it again revived. In 1790, Massachusetts made a representation to Congress, asking some encouragement, in the form of bounty on exported fish, which was granted, and the trade rapidly increasing in consequence of this stimulus, in 1807, 71,000 tons of shipping were employed in the Cod Fishery alone, and the exports for that and the four preceding years averaged 3,000,000 dollars.

The disputes with Great Britain respecting the orders in council gave a new check to this trade, which was, however, only temporary, for the very year after the peace was concluded, we find 68,000 tons, employing 10,000 fishermen, on the ocean; since then there has been a constant increase, so that in 1831, in the Barnstable district alone, licenses were granted to 188 vessels, averaging 58 to 100 tons each, manned by about 1000 men and boys, the gross proceeds of which fishery were estimated at 319,000. The quantity of Cod thus annually destroyed is immense, but it is more than counterbalanced by their powers of reproduction, the roes of a single female being calculated to contain more than 9,000,000 eggs.

Mackerel, from the immense numbers which are annually taken, off Massachusetts, furnish a most important part of American trade, thousands and hundreds of thousands of barrels being annually sent to the West Indies. In 1803, the Legislature of Massachusetts passed a law for an inspection of fish. The following table will exhibit the surprising alterations, and amazing extent of this important business. The number of vessels employed in 1831 did not fall short of 400; number of men, 4000. The probable

value of the proceeds of the Mackerel Fishery, for that year, exceeded a million and a half of dollars.

In 1803 the number of barrels was 8,079½

1805	8,936½	1818	47,210
1806	8,473	1819	105,433
1807	10,904½	1820	236,243
1808	7,738½	1821	111,009½
1809	8,865½	1822	160,294½
1810	13,058½	1823	145,006
1811*	19,632	1824	191,650½
1812	5,018½	1825	254,381½
1813	3,822½	1826	158,740½
1814	1,349	1827	196,310
1815 12 th	16,349½	1828	237,324½
1816	30,021	1829	225,882
1817	37,982	1830	309,462

Herrings are also an important article: they are certainly migratory, though their migrations may have been overruled. Their taking, it is said, the regular circuit of the sea, gives interest to their history: one immense army leave the Polar regions in the spring, equalling in extent the whole surface of Great Britain. As they advance, squadrons begin to separate from the main body. By September, England, Ireland, and Scotland are surrounded by them. From these parts, the forces move South-West, across the Atlantic, and make their appearance on the coast of Georgia about the last of January; detachments then begin to move eastward, till ultimately the whole coast of North America is lined with them, furnishing food for great numbers.—[Maryland P. Cou't.]

* The first year after the division of the state from Maine.

COMPRESSION OF WATER.—Mr. Jacob Perkins has invented an apparatus, which, by hydrostatic pressure, compresses water to an extent equal to a fourteenth part of its volume. The force employed is equivalent to a pressure of 30,000 lbs. to the square inch, and is applicable to other fluids. In most of our works on natural philosophy, water is treated as incompressible and non-elastic; by this apparatus the opposite of these two propositions is clearly shown. There was a considerable difficulty in getting a vessel capable of resisting so high a pressure; and the chief feature of this instrument is the manner of constructing the cylinder, which is formed of a series of concentric tubes: thus the inner or smaller tube is first formed by welding, and is turned accurately on the outer surface; the next tube is then formed, and is accurately turned on the inner surface, and the bore of this second or outer tube is just too small to receive the first tube, but, in order that it may do so, it is heated, till, by expansion, it is capable of receiving the first tube within it, and in cooling, the second tube shrinks on the first tube and strongly embraces them together; a third tube, a fourth, and so on, are similarly put on, till a cylinder is produced capable of withstanding any pressure.—[Repertory of Patent Inventions.]

IMITATION OF GOLD.—"A Chemist," of Washington City, publishes the following recipe for a preparation, which, applied to iron, will make it look like gold:

"Take of linseed oil, three ounces; tartar, two ounces; yolk of eggs, boiled hard and beaten, two ounces; aloes, half an ounce; saffron, five grains; turmeric, two grains. Boil all these ingredients in an earthen vessel, and with it wash the iron, and it will look like gold. If there be not linseed oil enough you may put in more."

DOMESTIC SILK HANDKERCHIEFS, the product of the native mulberry, have been manufactured in Dayton, Ohio, which are said to exceed the imported ones in durability.

Fig. 2.

Improved Syphons. By R. HARR, M. D., Professor of Chemistry in the University of Pennsylvania. [Communicated by the Author.]

Annexed are engravings of two syphons, which I have found useful in my laboratory. Of these, one represents the more complete method of execution; the other, that which can be more easily resorted to by chemists in general, who have no easy access to skilful workmen.

The construction last alluded to is represented by fig. 1. A cork is perforated in two places parallel to the axis. Through one of the perforations the longer leg of the syphon passes; into the other, one end of a small lead tube is inserted. In order to support this tube, it is wound about the syphon until it approaches the summit, where a portion, of about three or four inches in length, is left free, so that advantage may be taken of its flexibility to bend it into a situation convenient for applying the lips to the orifice. About the cork, the neck of a stout gum elastic bag is tied air tight. The joinings of the tubes with the cork must also be air tight. The lower half of the gum elastic bag is removed, as represented.

In order to put this syphon into operation, a bottle must be used, having a neck and mouth of such dimensions as to form an air tight juncture with the bag when pressed into it. This object being accomplished, the air must be inhaled from the bottle until the diminution of pressure causes the liquid to come over and fill the syphon. After this, on releasing the neck of the bottle, the current continues, as when established in any other way.

Fig. 2 represents the more complete construction. In this are two metal tubes, passing through perforations made for them in a brass disc, turned quite true. Through one of these tubes, which is by much the larger, the syphon passes, and is cemented air tight. The other answers the purpose of the leaden tube described in the preceding article. The brass disc is covered by a piece of gum elastic, which may be obtained by dividing a bag of proper dimensions. The covering thus procured is kept in its place by a brass band

or clasp, made to embrace both it and the circumference of the plate, and to fasten by means of a screw.

Before applying the caoutchouc, it was softened by soaking it in ether, and a hole, obviously necessary, was made in the centre by a hollow punch.

There is no difference between operating with this syphon, and that described in the preceding article, excepting that the juncture of the syphon with the bottle is effected by pressing the orifice of the latter against the disc covered with gum elastic.

DESCRIPTION OF THE VOCAL ORGANS.—[We are allowed to extract the following description of one of the most interesting parts of the human frame, from the Anatomical Class Book, by Dr. J. V. C. Smith, —the pioneer, we believe, of popular textbooks on this subject.]

By voice, animals have the power of making themselves understood to their own species—and these sounds are either *articulate* or *inarticulate*.

Language is an acquired power, having its origin in the wants of more than one individual. Man, without society, would only utter a natural cry, which sound would express nothing but pain.

Supposing a human being to have been entirely forsaken by those of his species, in that state of infancy when he could have no recollection of any thing pertaining to his race, his voice would, in essence, remain the cry of an infant, only strengthened in tone, at a particular age, by the development of the vocal organs to their destined size.

But let two individuals be placed together, but without communication or knowledge of the existence of beings similar to themselves, the natural cry of each would undergo modifications: the one would make a sound, to express a particular sensation, which in time would be understood by the other: a repetition of the same note would be the sign of that sensation in future.

An additional sensation, having an intimate connection with the first, would require a variation of tone,—and this would also be

come a symbol of two sensations. Here then would be the origin of language. Multiply the species, and each new member of the society would express some other sensation or want, by another modification of the original cry. Here we discover the certain commencement of a spoken language; these different sounds becoming classified, constitute a dictionary, in which each word is the mark or sign of particular sounds; thus, if an individual can imitate the sound, or a series of sounds, he masters a language. Let it be remembered that man could never arrive to this perfection in sound or language, if his vocal organs were not differently constructed from brutes. Such is the mechanism of theirs, that so many sounds, and no more, can be made; but in man's organs, there is no limitation—no sound appreciable that he cannot imitate.

The Vocal Box, or Larynx.—Directly under the integuments on the front side of the neck, is a cartilaginous tube, the *trachea*, or wind-pipe, built up of a series of narrow strips, which are portions of a ring; therefore, it is always kept free and open. At its lower end it divides into two branches, going to the lungs on either side, but its upper portion is enlarged, just under the chin, and finally opens in common with the tube of the stomach and mouth. This enlarged part, quite prominent in man, is the *larynx* or vocal organ.

Several cartilages assist in its formation, viz., the *thyroid*, *cricoid*, the *arytænoïd*, and the *epiglottis*. The cricoid is the foundation; the thyroid is the wall around it; the arytænoïd are appendages to the back of the cricoid; and the epiglottis is a valve, opening and closing the entrance into the windpipe, like the valve of a bellows.

Fig. 1.

Fig. 2.

Explanation of figures 1, 2.—The five cartilages are—1, the epiglottis; 2, the thyroid cartilage; 3, the cricoid auxiliary; and 4, the two arytænoïd cartilages; 5, the two superior horns of the thyroid cartilage; 6, the two inferior horns; 7, the suspensory ligament of the os hyoides; 8, the os hyoides; 9, the azygos ligament, connecting the os hyoides to the thyroid cartilage; 10, the two lateral ligaments connecting the horns of the os hyoides to the superior horns of the thyroid cartilage.

One of these diagrams presents a front and the other a back view of the *larynx* or vocal box. The bone of the tongue is seen, like half of a hoop, marked 8, in both plans. 2 is the front of the *thyroid cartilage*, felt under the skin—protruding in the form of an irregular tumor. The wind-pipe is the tube

at the bottom of each larynx. The *vocal cords*—the membranes which vibrate to produce sound, as the current of air rushes by—are concealed, being placed inside. From the remarks in the text, together with the references, a very correct idea will be formed of the structure of this curious organ. By blowing through the wind-pipe of almost any animal, soon after it is slain, provided the larynx has not been injured, the vocal cords may be put in motion, and the sound which is produced will bear considerable analogy to the natural voice of the animal.

Within the larynx, and consequently below the valve, are four delicate membranes, two on each side, put upon the stretch—being, in fact, like shelves—their thin edges nearly meeting from the opposite sides, so that there is scarcely any space between them. These are the vocal cords.

When the air rushes out from the lungs through the wind-pipe, it must obviously pass through the larynx,—in doing which it strikes the tense edges of the cords, and produces a vibration. This vibratory motion given to the current of air produces sound. In the cavities of the bones of the face, forehead and nose, its power is increased, and in the mouth it undergoes further modifications, and ultimately becomes articulate language. The teeth, tongue, lips, nose and fauces, have each an influence in the production of articulate sounds. Hence grammarians have arranged the human voice under the appropriate divisions of *guttural*, *nasal*, *dental* and *labial* sounds,—expressive of the agency which each of these organs exert on the original tone.

Shrillness or roughness of voice depends on the diameter of the larynx,—its elasticity, lubricity, and the force with which the expired air is propelled through the *rima glottidis*, or slit-like chink, between the vocal cords.

It is because the larynx is smaller in women, and more elastic, that their voice is of a different character. The breaking of the voice, (*vox rauca*), noticeable in boys, at a peculiar age, depends partly on the enlargement of the apartments within the bones, which generally takes place at that important crisis of their lives, when the whole constitution undergoes a sudden change.

But the mechanism of voice would have been incomplete, were there not a number of exceedingly delicate muscles, which graduate the diameter of the narrow slit through which the sound escapes into the mouth. Unconsciously, they effect the requisite contractions, forever varying, according to the rapidity, intensity, or strength of the voice, in singing, conversation, or declamation.

Finally, the larynx is a musical wind-instrument, of the *reeded* kind, on the principle of the hautboy. The nearness of the vocal cords to each other resembles the reed precisely. All the tones of reeded instruments are effected by finger holes,—but the tones of the human voice are varied by the extrinsic and intrinsic muscles, which shorten or elongate the vocal tube. Thus the same result is produced by this process,—increasing or diminishing the diameter of the larynx, that is accomplished in the clarinet, bassoon, flute and hautboy, by a graduated scale of finger holes.

Is not this another beautiful mechanical evidence of the existence of a Being superior to ourselves!

AGRICULTURE, &c.

[From the New-York Farmer.]

MANAGEMENT OF BEES IN CASHMERE.—Those who take an interest in the rearing of bees will not be deterred from reading this article on account of its length.

Every farmer in Cashmere has several beehives in his house, and in some houses I have counted as many as ten. A provision is made for these in building the house, by leaving appropriate cavities in the wall, and which somewhat differ in size, but agree in their general form, each being cylindrical, and extending quite through the wall. The tube thus formed is lined by a plastering of clay mortar, about an inch in thickness, and the mortar is worked up with the chaff or husk of rice, or the down of thistles, which latter is employed for clay mortar in general, being the first application of this substance to the use of man I have yet witnessed. The dimensions of a hive are, on an average, about fourteen inches in diameter, and when closed at both ends, about twenty or twenty-two inches in length. The end of the cylinder nearest the apartment is closed by a round plaster of red pottery ware, a little convex in the middle, but with the edges made flush with the wall by a luting of clay mortar, and the other extremity is shut by a similar disk, having a circular hole about a third of an inch in diameter in the centre. It does not appear that there is any particular rule for the height of these hives from the ground, as they are sometimes confined to the walls of the lower basement story, generally appropriated to cattle in the farm-houses of Cashmere; others are inserted into those of the first floor, and are frequently in both situations in the same house, as well as the walls of its outbuildings. So great difference exists between the practice ordinarily pursued in Cashmere and in Europe, in respect to living new swarms when the honey is taken, that it deserves imitation. Although the season for taking the honey had passed when I visited Cashmere, in the beginning of November, the cottagers indulged my wish of seeing the process by which this was effected, but with little injury to the bees and with perfect safety to the individuals concerned in its management, and which was as follows:—Having in readiness a wisp of dry straw, and a small quantity of burning charcoal in an earthen dish, the master of the house, with a few strokes of the point of the sickle, disengaged the inner plaster of the hive, bringing into view the combs suspended from the roof of the hive, and almost wholly covered with bees, none of which, however, offered to resent the aggression, or to enter the room. Having placed the straw upon the charcoal, and holding the dish close to the mouth of the hive, he blew the smoke strongly against the combs, but removed the dish the instant the straw took fire, to prevent it burning the bees, and quenched the flame before he employed it again. Almost stifled by the smoke, the bees hurried out of the outer door with such rapidity, that the hive was cleared of its inhabitants within a few minutes, when the farmer, introducing the sickle, cut down the combs nearest to him, which were secured into a dish previously slid under them, and left undisturbed about one-third of the combs, which were almost close to the outer door. He then re-plastered the inner plaster, and brushing off hastily a few bees that clung to the combs, though apparently in a state of stupefaction, threw them out of the house. Observing many other bees lying motionless on the floor of the hive, I inquired whether they were dead or only stupefied, and was answered that they would recover; preparations for continuing my journey at a very early hour on the following morning, having unluckily prevented my examining the spot where they had been thrown out, until poultry had for some time been feeding near it. The expelled bees returned as soon as the

cavity was freed from smoke, without stinging a single individual, and the whole business was completed in less than ten minutes, without, as was asserted, any perceptible loss. The honey was light-colored, and of a taste as pure and sweet as that of Narbonne. It possessed less of the cloying quality generally attending this substance, than any other I recollect to have met with; nor could I learn that the farmer had any suspicion of its ever being intoxicating or poisonous, as in the case occasionally with that made by the Bhoura (*Apis irritabilis*), or large wild bee in the northern mountains of Gurwhal, from feeding, as it is reported, on the flower of the monkhood. I was directed more particularly to inquire upon this subject, by having observed this plant in flower in the valley of Bunga, a few miles to the eastward of the bee district, and think probable that it extends to these mountains. The peasantry of Cashmere are unacquainted with the employment of honey as the basis of a fermented liquor, but eat it raw or mixed with articles of common food, whilst the most wealthy substitute it for sugar in preserving fruits. It is customary to take the hive every year; about the end of September or beginning of October is found the best season for this operation, a little time still remaining for the bees to add to the portion left for their support during five months. This amounts to about one-third of the whole produce, and would appear to suffice, as swarms seldom die, and the Cashmeres substitute no other article of food. It is stated that an old swarm yields more honey than a young one, and that families seldom die except of old age. I was informed that it was no uncommon circumstance to preserve the same community for ten or even fifteen years; and some instances were quoted of a family having been retained for twenty years; but this was held to be a very rare occurrence. In consequence of the bees being thus literally domesticated, they acquire a mildness of conduct far more decided than those of Europe; and it is possible that the confidence thus gained, subduing their natural irascibility, may generate an increase of industry, or at least an increase of produce in relation to the number and size of the individuals of each community. It is also clear, that the situation of the hive keeps many of the natural enemies of the bees at a distance. The bee of Cashmere is a little smaller than that of Europe, though a little larger than the domesticated bee of Kumavon and of Gurwhal. The Bhoura, the rock bee of Gurwhal, or the bee of the southern mountains, is, on the other hand, greatly larger than the domesticated bee of Europe, and greatly exceeds it also in the number of individuals in each community, and in the size and weight of its combs. But its honey is sometimes contaminated by an intoxicating quality, and the temper of the insect is so irritable, as to be brought into a dangerous state of activity by a slight show of aggression. The former quality is suspected, upon probable grounds, to be caused by the secretion of the aconite eaten by the bee, and its irritability of disposition to be owing partly to the exposed situation of the combs suspended from the lower surface of a ledge of rock, and partly to the occasional attempts of bears to carry them off. But these deductions from the merits of this bee are merely the result of localities; and under due precautions, it is presumed its irascibility might be so far subdued as to render it just as safe an inhabitant of a wall-hive as the smaller variety of bee. In a portion of the Punjab, near the hills, this bee is also met with; and I have seen the under surface of the principal branches of a large Peepul tree studded with so many colonies, individually of such great strength as to deter the neighboring peasantry from attempting to deprive them of their stores, notwithstanding it was conjectured that there were several hundred weight of combs on the tree. The largest of these assemblages of combs—the probable accumulation of many

seasons—was of such a size as I think it not prudent to cite; but from the specimens I have seen of the produce of this bee, I conceive their domestication, if introduced into Europe, would prove a most valuable acquisition to this branch of farming, although I must confess myself unable to devise any safe and easy plan for transporting such a colony.—[Mr. William Moorcroft in the Journal of the Royal Geographical Society.]

ITALIAN RYE GRASS.—In the 'Transactions of the Highland Society, we find an article on this subject, by Mr. Charles Lawson:

This plant is said to be distinguished from the common rye grass (*Lolium perenne*), by its larger leaves, by its being of a deeper green, and by the greater height to which it grows. It is usually sown in autumn, as is the general practice with grass seeds in the south of Europe. After the field is harrowed, it is sown at the rate of from 16 to 18 lbs. per acre, and the seed rolled in. In the following autumn, the turf is covered like an old meadow, and the crop of the following year is more than double. It may be also sown in spring. If it be sown with clover or lucerne, its growth is so rapid, that it will quickly choke them. It is eaten greedily by cattle, whether green or dry, and yields fifty per cent. of hay.—[Bulletin des Sciences Agricoles.]

USE OF THE ROLLER.—A very small proportion of the farmers in Western New-York are provided with this valuable implement, and I am confident that very few of them would be without it, if they knew its value.

When my wheat came up in the autumn of 1832, I discovered that in one field my hired man had not sowed it evenly; but it was then, as I thought, too late to remedy it. In the spring it presented the same unpromising appearance, being so thin in many places that I anticipated a short crop. Being disappointed in receiving my clover seed for the same field as early as I wished, I was apprehensive of a failure in that also, and to prevent it, directed my son to roll the field. Witnessing the effect, in completely pulverising the crust which had formed on its surface, I was led to conclude that the operation had not only placed the clover seed in a favorable situation to vegetate, but would benefit my wheat also; and therefore directed the residue of my wheat to be rolled. Business called me from home for several weeks, and on my return was astonished to find that my wheat had spread so as to stand nearly as thick as I wished; and at harvest it appeared to be perfectly even, and produced a fine crop. I think that I must have gained by rolling at least one-fourth. My clover seed took well.

Last spring I rolled after sowing and harrowing my oats, which came up very soon and regularly and produced a heavy crop.

The past autumn I rolled one wheat field immediately after harrowing, and I think it came up more equally and sooner for the operation. I have also rolled a part of two other fields, in order to ascertain whether rolling in autumn is beneficial to the wheat, the result of which I may hereafter communicate. The only doubt I have as to its utility, arises from the belief that snow lying on wheat is advantageous, and a fear that rolling the ground will cause it to be more easily blown off. The above mentioned trial of rolling in the spring is conclusive as to its benefits at that season. Another benefit resulting is, that the ground is left in so smooth a state that the crop is much easier cut, and gathered with less waste.

I have also experienced great benefit from the use of the roller on green sward ploughed in the fall, and left in a rough state through the winter. By passing the roller over it previous to harrowing, the inequalities are removed, and the operation of harrowing rendered much more effective.

I am led to believe that in all cases where

green sward is turned under for a crop, rolling must be beneficial, even when it is to be a naked fallow, closing the interstices, and the compression having the effect to produce a more equable and thorough decomposition of the sward.

The effect of a roller on mowing grounds is to enable the mower to cut the grass closer, and to prepare the land for the use of the horse-rake: an implement which, with a horse and boy, will do the work of six men.

Now is the time for every farmer not already furnished with a roller, to procure a stick of heavy white oak, two to two and a half feet diameter, and six feet long; use gudgeons made of one and a half inch iron; drive them in the centre of the stick, then raise it so that the gudgeons will rest on blocks, when there will be no difficulty in bringing it to the shape of an exact cylinder. All that remains to be done is to make a stout frame and tongue, the latter well braced.—[Gen. Far.]

NATIVE GRAPES.—The following is the testimony of N. Longworth, Esq., one of the most extensive vine growers in this country:

The Catawba is superior as a wine and table grape to the Isabella, and matures its fruit better, though a less abundant bearer. We have native grapes in most of our states, could a selection be made, that would leave us little cause to regret that foreign grapes succeed so badly with us.

DAIRY HUSBANDRY OF HOLLAND.—Some idea may be formed of the great importance and extent of the dairy husbandry in Holland, by examining the official returns of importation into this kingdom. In the year ending 5th January, 1830, it appears that out of 148,164 cwt. of butter imported from foreign countries, 116,233 cwt. were imported from Holland; and of 168,900 cwt. cheese, 167,913 cwt. were imported from that country. The duty alone on these two articles from Holland, at 20s. per cwt. on butter, and 10s. 6d. on cheese, amounted to £204,386, and these quantities must have cost the consumers, the butter, £523,048; the cheese, £292,282; total, £815,330.—[Mr. Mitchell on the Dairy Husbandry in Holland.]

SUBSTITUTE FOR SWEET POTATOES.—The cocoanut squash, cut into pieces, and roasted like sweet potatoes, is found to be fully equal to them, and so closely to resemble them in flavor that it would be difficult to distinguish between them. It grows freely in this climate, and may be kept till mid-winter.—[Goodsell's Farmer.]

CULTURE OF SILK.—Wednesday, in the House, the bill to encourage the cultivation of Mulberry Trees and the production of Silk was passed to a third reading. This bill gives a bounty of two dollars for every hundred of trees set out at the rate of 600 to the acre, and one dollar for every pound of domestic reeled silk. The consideration of the above bill was attended by a very interesting debate, in which the following gentlemen took part: Messrs. Gray, Moseley, Rockwell, Enstis, Thayer, Chapman, Forward, M'Kay, Lincoln, and Kinsman. Mr. Moseley communicated much interesting information. He stated that the mulberry tree would grow in any country between 20 and 50 degrees of latitude—that sandy and gravelly soil suited it best—that the required labor could be performed by children—and that 600 lbs. of silk, worth \$3 per lb., could be obtained from the worms fed on the trees which could be raised on one acre of ground.

Mr. Chapman, of Greenfield, who opposed the bill, made some judicious remarks as to such articles as are ornamental, and such as are useful. But the question was not whether our people had better wear silk, but whether,

if they will wear it, it is best that a good part of it should be produced in this country, or that nearly the whole should be imported. He wished our farmers' wives and daughters should be able to procure silks at 50 cents a yard, rather than at a dollar. Domestic competition may effect this. But, if we do not choose to wear silk, we may produce it to export.—[N. E. Farmer.]

SOIL AND AGRICULTURE IN OHIO.—The bottom lands are low and subject to occasional floodings, but are of a very rich soil. Pickaway county is nearly square in outline, being twenty-two by twenty-one miles in extent, and contains sixteen thousand inhabitants. The Scioto river passes through it from N. to S. dividing it into two nearly equal portions. The lands on the east side are of a very excellent quality, and produce all the different kinds of grain in the most luxuriant abundance. The county contains four varieties of soils, wood lands, barrens, plains and prairies. On suitable soils, from forty to forty-five bushels of wheat are produced, and in early days, before the rich prairies were reduced by successive crops, one hundred bushels of corn per acre were not uncommon. By the rich farmers, cultivation is carried on in a style and grandeur proportionate to the exuberance of the crops. Fields of one hundred acres of wheat, or of corn, are often seen, and frequently they are extended to three or four hundred. A few years since, when wheat commanded a dollar per bushel, a rich farmer on the Pickaway plains cultivated one thousand acres in a single field, which, when undulating under a gentle breeze, might not unaptly be called an ocean of verdure. In all the counties bordering on the canal, there has, since it was opened, been an increase in the value of wheat of from ten to fifteen cents per bushel, and so of many other articles: the canal giving them the advantage of the New-York markets, whereas, before, they had only that of the Mississippi.—[Silliman's Journal.]

APPLICATION OF STEAM TO AGRICULTURE.

—We hope the day will never come when there shall be so much ignorance and prejudice in this country that our farmers will be in that condition mentioned in the last sentence of the following paragraph, taken from the London Gardener's Magazine.

The application of steam to agricultural purposes is said to have lately called forth a powerful and effective engine in France; and it has at the same time produced a steam digging machine in England. This engine, an imperfect model of which we saw three years ago, has lately been so far improved that a patent has been taken out for it by Mr. Philips. It will be found figured and described in Gordon's Journal of Locomotion, for February, 1833. We have lately seen the model of another machine, which may be applied to the same purpose, and, as it appears to us, with much greater chance of success. At one operation it could be made to plough, pulverize, roll, sow, and harrow, a breadth of 10 feet or 12 feet, at the rate of 5 or 6 miles, and consequently between 7 and 8 acres per hour. The machine might, no doubt, be impelled at double that rate; but it is questionable whether at such a velocity the work of sowing could be properly performed. The present, however, is not the time for bringing out such a machine in

England, where the farmers, in most districts, are obliged to take down and conceal the wheels of their threshing machines, if these have not been already burned by their laborers.

CHINESE ROSES may be propagated from single buds, as grape vines are propagated. The single bud, with a quarter of an inch of the stem, both above and below it, is placed just under the soil, under a bell-glass; the leafstalks and leaves standing upright as in a cutting. A single bud of *Rosa semper-florens sanguinea* was planted on July 26, and on September 8. October 9 it was six inches high, and side shoots were being produced.—[Charles M. Willich, London, Oct. 3, 1833.]

GYPSUM.—The editor of the Farmer's Register says he has found gypsum very efficacious on a soil which, before it had been marled, exhibited no beneficial effects.

MANURE IN DRY SEASONS.—Dr. J. P. Beekman, of Kinderhook, in writing to the editor of the Farmer's Register, says, "There is an ameliorating and fructifying quality about the sod that imparts its powers to the grain that succeeds it, which is not discernible in the properties of the manure; and in dry seasons the effects of this last are *almost entirely lost*." We should be pleased to learn from Dr. Beekman, whether this manure was properly fermented, or in its coarse unrotted state? It seems to us a subject of much importance to avoid this loss of manure and time.

Suggestions relative to Gardeners' Work for March. By the EDITOR.

The month of March, like a fickle and inconstant person, is neither admired nor loved. Sometimes, indeed, it puts on a cheering and smiling aspect, inviting us to visit its lawns and its promenades, and to listen to the first notes of spring music. Again, all is chill and gloom; no cordiality, no welcome reception, but all is forbidding and stormy. Its character being known, very little is expected from it; and consequently, most people are on their guard against its fickleness and deceptive appearances. Most gardeners venture to do little more than to make diligent preparations for the more mild, uniform, and lovely April.

In reference to early and late sowing, we refer our readers to the article in this number, page 66. Although late sowing may insure greater crops, yet, after a long winter, it is very desirable and very natural to have early vegetables. Should March be proportionably mild, as the past February has been, vegetation will be some ten or fifteen days earlier than usual. The seeds of many kinds of vegetables may be put in boxes and pots, and placed in the kitchen, or other warm situations; and when the season is sufficiently advanced, the young plants should be removed with the dirt or soil into the ground in the open air. Peas may very easily be advanced in this way. Some plant their peas, beans, and potatoes, on inverted sods of earth, placed in convenient boxes, and kept moist. When the time arrives to transplant them into the garden, the sods are easily taken up with growing vegetable, and properly placed in their permanent place.

RHUBARB, *Rheum rhabarbarum*.—Those who have this vegetable should, if they have

not done it before, place over each plant a barrel, or large box, which, if covered with heating horse manure, will soon cause them to grow and be beautifully blanched. In the latter part of the month, or early in April, the leaves will be sufficiently large for making the much admired rhubarb pies.

TRANSPLANTING.—As soon as the ground is thawed, those who conveniently can, should begin to transplant. It is much better to commence early this month than to run the risk of delaying until vegetation starts. Those who are desirous to have fruit trees already in bearing, and their premises embellished with sizeable ornamental trees, should immediately undertake the business.

MANURE.—Whatever diversity of opinion may be entertained respecting rotted and unrotted manure in field culture, there should be none in reference to garden operations. Let the manure be well fermented and in a moist state, particularly in a sandy soil. A more uniform growth and greater certainty of maturity are the consequences of using fermented manures. For flowers and vegetables, bone manure has advantages.

Cultivation of Peach Trees. By D. B. [For the New-York Farmer and American Gardener's Magazine.]

In the New-York Farmer for January, page 2, is an article on the cultivation of the peach tree, by R. H. B., in which he says that "peach trees may be preserved by good management, twenty, and probably forty or fifty years." Whether it be true, as he asserts, that the peach tree is "destroyed by a worm which feeds on the inner bark of the tree, at its root," I am not about to admit or deny. If, however, it is true, as he asserts, "that the peach tree, if the worm is kept out of the root, will live at least twenty years; and that this may certainly be done by attacking them the first year of its growth, and continuing to extract them for three or four years in succession," it would seem that any means by which a "lodgment" of the worm in the "inner bark of the tree could be prevented, would conduce more to the general health and vigorous growth of the tree than any attack upon them, after, a "lodgment" was once effected, could possibly do. Now, my object is not controversy, but to suggest to R. H. B., and others, what I deem an effectual method of preventing a "lodgment" of the worm in the "inner bark of the tree." Previous to 1832 I had made repeated trials to cultivate the peach tree, with the same uniform ill success. Till the second or third, and sometimes till the fourth year, my trees were healthy and their growth vigorous, when they would begin to decline and soon die, and often without any apparent injury from the worm. From repeated failures, I had wholly abandoned their cultivation as hopeless. In the spring of that year a friend of mine, agent for the Messrs. —, had a lot of peach trees consigned to him for sale. They were offered for a time at private sale, and finally advertized to be sold at auction; but a part only could be sold, the trees having been out of the ground so long, and the season so far advanced that there remained no prospect of selling them. I had from the agent the offer of a bundle of the trees, and found them, as I supposed, refuse trees, probably taken from a part of the nursery which was to be cleared to make room for a new crop. Unpromising as they were, I made them the subjects of the follow-

ing experiment. A hole was dug, large enough to admit the roots in their natural position; after which, sufficient earth was hauled over the roots to cover the smaller ones, and support the tree in its position. A kettle of common tar was at hand, warmed so as to enable me to spread it freely over the larger roots, and up the body of the tree several inches above the surface of the ground. The holes were then filled with earth as usual. All the trees thus treated, (23 in number,) started, but the greater part of them, as I expected, from the unfavorable circumstances already related, died in the course of the summer. Those that survived the first summer, (8 or 10 in number,) have grown very vigorously, and are now apparently as healthy as any trees I have of any description. I have from time to time examined them, and, as often as appeared necessary, have removed the earth and made a fresh application of tar, and again replaced the earth. This is in no case necessary more than twice in a year, generally once is sufficient; and, perhaps, as a general rule, the fall would be the best season, if but one dressing was given in a year, for the reason that the winter would not perceptibly diminish the quantity; and if applied in the fall, would always be in season to prevent the early ravages of the worm.

Granting what R. H. B. assumes to be the fact, that the worm is the cause of the destruction of peach trees, it is certainly important, if possible, to prevent its ravages. He proposes a "remedy," which he says "consists in searching for the openings in the bark at the root, and taking them out." In this, as in every other case, preventive is better than "remedy." Let then R. H. B., and all others who would prevent a "lodgment" of the worm "at the roots" of their peach trees, try the application of tar as above directed; and if faithfully done, I hesitate not to say that the preventive will be found more effectual, and attended with less trouble, than the "remedy," and may, by wholly excluding the worm, help to settle the question, whether it is the cause of the decay of peach trees, or only a consequence of it.

Ridgefield, Ct., February, 1834.

LOVE OF MUSIC BY SHEEP.—We were surrounded by a large flock of sheep which were leaving their fold to go to pasture; one of our party took his flute out of his pocket, and saying, "I am going to turn Corydon, let us see whether the sheep will recognize their pastor," began to play. The sheep and goats, which were following each other towards the mountain with their heads hanging down, raised them at the first sounds of the flute; and all, with a general and hasty movement, turned to the side from whence the agreeable noise proceeded. Gradually they flocked round the musician, and listened with motionless attention. He ceased playing; still the sheep did not stir. The shepherd with his staff obliged those nearest to him to move on. They obeyed; but no sooner did the fluter begin again, to play, than his innocent auditors returned to him. The shepherd, out of patience, pelted them with clods of earth, but not one of them would move. The fluter played with additional skill; the shepherd exasperated, whistled, swore, and pelted the fleecy amateurs with stones. Such as were hit by them began to march, but others still refused to stir. At last the shepherd was obliged to entreat our Orpheus to cease his magical sounds. The sheep then moved off, but continued to stop at a distance as often as our friend resumed his instrument.—[Vic de Haydn par Bombat.]

NEW-YORK AMERICAN.

MARCH 8-14, 1834.

LITERARY NOTICES.

Owing to the distant region in which our accomplished correspondent—whose letters under the initial H. have been so eagerly and justly sought after—is now travelling—as well as to the irregularity of the mails, we have no letter from him to present to-day.

We must add, too, that although we have on our table several interesting and valuable publications claiming notice, we are so absorbed in the all-important political discussions of the day, that we must for a while ask the indulgence, both of our literary readers and friendly publishers. We can only to-day speak of a few.

LETTERS OF MAJOR JACK DOWNING, 1 vol. New York: Harper & Brothers.—The celebrity of *Major Jack Downing* is not surpassed at this day in the U. States, by that of any individual, however exalted. The public voice has unanimously awarded to his letters the praise of a consistent graphic record of the acts and doings of the President and his advisers—which, without ever violating the unity of the old *General's* character, uses up, without stint, the interested speculators who betray his confidence.

This volume—which we need hardly say contains the letters originally published in the *Daily Advertiser*—is well printed, and illustrated with some amusing and spirited engravings.

HISTORY OF SCULPTURE, PAINTING AND ARCHITECTURE: by J. S. MEMES, L. L. D. 1 vol. Boston—CLAPP & BROADUS.

It is not without justice that we may claim as Americans to have already produced in our short career as a nation many remarkable painters—the names of some of whom will certainly live. In Sculpture we have been less distinguished; though Greenough, and Auger, and Frazee, are in that branch of the fine arts, too, winning renown; but in Architecture, all is blank with us. The bump of building, if phrenologists will allow us so to speak—we have abundantly; but that of architecture has not, to our knowledge, as yet been practically developed on any American head. Hence, we are gratified in seeing this number of *Constable's Miscellany* re-published in this country; and commend it to our readers in the persuasion that they will find it agreeable in its style and abounding in information imparted with good taste.—We have marked some extracts which at a future day we shall publish.

THE AMERICAN MONTHLY MAGAZINE, FOR MARCH.—We can give unstinted praise to this periodical—which goes on with talent, industry, and spirit; and we are glad to learn with increasing success. We copy part of a very spirited article—"passages of the Life of Mary Stuart." The ill-fated *Chastelar* having just discovered to Mary his love, and been indignantly dismissed—the scene is thus continued:

An hour had scarce elapsed, before the lights were extinguished throughout the vaulted halls of Holyrood; the guards were posted for the night, the officers had gone their rounds, the ladies of the royal circle were dismissed, and all was darkness and silence. In Mary's chamber a single lamp was burning in a small recess, before a beautifully executed painting of the virgin, but the light was not sufficient to penetrate the obscurity which reigned in the many angles and alcoves of that irregular apartment, although the moonbeams were admitted through the open casement.

Her garb of ceremony laid aside, her lovely shape sweetly veiled by a single robe of spotless linen, her auburn tresses flowing in unrestrained luxuriance almost to her feet, if she had been a creature of perfect human beauty when viewed in all the pomp of royal pageantry, she now appeared a being of supernatural loveliness. Her small white feet, unsandalled, glided over the rich carpet with a grace, which a slight degree of fancy might have deemed the motion peculiar to the inhabitants of ano-

ther world. For an instant, ere she turned to her repose, she leaned against the carved mullions of the window, and gazed pensively, and it might be, sadly, upon the garden, where she had so lately parted from the unhappy youth, whose life was thus embittered by that very feeling, which above all others should have been its consolation. Withdrawing her eyes from the moonlit scene, she knelt before the lamp and the shrine which it illuminated, and her whispered orisons arose, pure as the source from which they flowed—the prayers of a weak and humble mortal, penitent for every trivial error, breathing all confidence to Him, who can alone protect or pardon; the prayers of a Queen for her numerous children, and last and holiest of all, a woman's prayers for her unfortunate admirer. Yes, she prayed for *Chastelar*, that strength might be given to him from on high, to bear the crosses of a miserable life, and that by divine mercy the hopeless love might be uprooted from his breast. The words burst passionately from her lips, her whole form quivered with the excess of her emotion, and the big tears fell like rain from her uplifted eyes. While she was yet in the very flood of passion, a sigh was breathed so clearly audible, that the conviction flashed like lightning on her soul, that this most secret prayer was listened to by other ears than those of heavenly ministers. Terror, acute terror, took possession of her mind, banishing by its superior violence every less engrossing idea. She snatched the lamp from its niche—waved it slowly around the chamber, and there, in the most hallowed spot of her widowed chamber, a spy upon her unguarded moments, stood a dark figure. Even in that moment of astonishment and fear, as if by instinct, the beautiful instinct of purely female modesty, she snatched a velvet mantle from the seat on which it had been cast aside, and veiled her person even before she spoke—"Oh God it is *de Chastelar*."

"Sweet Queen,"—replied the intruder—"bright, beautiful ruler of my destinies, pardon—"

"What ho!"—she screamed in notes of dread intensity—"à moi à moi mes Français.—My guards!—Seyton—Carmichael—Fleming—will ye leave your Queen alone! alone with treachery and black dishonor!—Villain! Slave!"—she cried, turning her flashing eyes upon him, her whole form swelling as it were with all the fury of injured innocence—"didst thou dare to think that Mary—Mary, the wife of Francis—the anointed Queen of Scotland, would brook thine infamous addresses—Nay kneel not,—or I spurn thee—What ho! will no one aid in mine extremity—"

"Fear nought from me—" faltered the wretched *Chastelar*, but with a voice like that of some inspired Pythoness she broke in—"FEAR! think'at thou that I could fear a thing, an abject coward thing, like thee?—a wretch that would exult in the infamy of one whom he pretends to love. FEAR thee—by heavens, if I could have feared, contempt must have forbidden it."

"Nay—Mary—hear me! hear me but one word, if that word cost my life—"

Thy life—hadst thou ten thousand lives, they would be but a feather in the scale against thy monstrous villany. "What ho!"—again she cried, stamping with impatient anger at the delay of her attendants—"Treason! My guards—Treason!" At length the passages rang with the hurried footsteps of the startled inmates of the palace—with torch, and spear, and brandished blades, they rushed into the apartment—page, sentinel, and chamberlain, ladies, with dishevelled hair, and faces blanched with terror.—The Queen stood erect in the centre of the room, pointing with one white arm bare to the shoulder towards the wretched culprit, who with folded arms and head erect awaited his doom in unresisting silence. His naked rapier, with which alone he might have foiled the united efforts of his enemies, lay at his feet—his brow was white as sculptured marble, and no less rigid, but his eyes glared wildly, and his lips quivered as though he would have spoken. The Queen, still furious at the wrong which he had done her fame, marked the expression. "Silence!" she cried—"Degraded!—wouldst thou meanly beg thy forfeit life—Wert thou my father, thou shouldst die to-morrow!—Hence with the villain!—Bid Maitland execute the warrant—Ourselves—Ourselves will sign it—away! *Chastelar* dies at day break!"

"Tis well—" replied he calmly—"it is well—the lips I love the best pronounce my doom; and I die happy, since I die for Mary!—Wouldst thou but pity the offender, while thou dost doom the offence, *de Chastelar* would not exchange his shortened span of life, and violent death, for the brightest crown of Christendom. My limbs may die—my love will live for ever! Lead on minions—I am more glad to die,

than ye to slay!—Mary—Beautiful Mary—think! think hereafter upon *Chastelar*!"

The guards passed onward—last of the group, unfettered and unmoved, *de Chastelar* stalked after them. Once, ere he stooped beneath the low browed portal, he paused, placed both hands on his heart, bowed lowly and then pointed upwards, as he chanted once again the words *Pensez à moi—Noble Dame—Pensez à moi*. As he vanished from her presence, she waved her hand impatiently to be left alone—and all night long she traversed and re-traversed the floor of her chamber in paroxysms of the fiercest despair. The warrant was brought to her—silently, sternly, she traced her signature beneath it,—not a sign of sympathy was on her pallid features, not a tremor shook her frame; she was passionless, majestic, and unmoved. The secretary left the chamber on his fatal errand—and Mary was again a woman. Prostrate upon her couch she lay, sobbing and weeping as though her very soul was burning from her bosom, defying all consolation, spurning every offer at remedy. "'Tis done!" she would say—" 'Tis done!—I have preserved my fame, and murdered mine only friend."

The morning dawned slowly—and the heavy bells of all the churches clanged the death peal of *Chastelar*. The tramp of the cavalry defiling from the palace gates struck on her heart as though each hoof dashed on her bosom. An hour passed away—the minute bells still tolling—the roar of a culverin swept heavily downwards from the castle, and all was over!—He had died as he had lived, undaunted—as he had lived, devoted!—"Mary, Divine Mary,"—were his latest words—I love in death, as I have loved in life—thee and thee only." The axe drank his blood, and the Queen of Scotland had no a truer servant left behind, than he, whom for a moment's frenzy she was compelled to slay—yet was his last wish satisfied, for though the Queen might not relent, the woman did forgive, and, in many a mournful hour did Mary think on *Chastelar*. H.

LUCIA, THE BETROTHED, from the Italian of *Alessandro Manzoni*, 2 vols; New York, G. DRABORN.—This translation from a novel—if so we must call a work full of the finest developments of character, and tending to the highest moral aims—renowned in Italian literature, is a welcome contribution to our own. It furnishes a view of Italian manners and society in the commencement of the seventeenth century, of great power and interest; its historical details are curious and instructive; and in the extract we make, descriptive of a city laboring under the panic and sufferings of a pestilence, the vigor of the author's pen will be acknowledged and felt by all. It is a remarkable coincidence, that the same delusion which, during the plague of Milan in 1628-9, affrighted the populace with the idea that secret poisons were producing all the mischief, prevailed during the existence of the Cholera in Paris, more than two centuries afterwards, namely in 1832.

The translation is, throughout, faithful almost perhaps to a fault:

The council of ten then requested the cardinal to order a solemn procession, for the purpose of carrying through the streets the body of San Carlos.—The good prelate refused; this confidence in a doubtful means disturbed him, and he feared, if the effect should not be obtained, confidence would be converted into infidelity, and rebellion against God. He also feared that if there really were poisoners, this procession would be a favorable occasion for their machinations, and if there were not, so great a collection would have a tendency to spread the contagion.

The doors of public edifices and private houses had been again plastered with venomous substances; the news of the discovery flew from mouth to mouth; the people, embittered by present suffering, and irritated by the imminence of the danger, embraced the belief voluntarily; as the idea of subtle instantaneous poison was more than sufficient to explain the violence, and the most incomprehensible circumstances of the disease. Adding to it the idea of enchantment, by which any effect was possible, any objection rendered feeble, every difficulty was explained. If the effects did not immediately succeed the first attempt, the cause was easy to assign; it had been done by those to whom the art was new, and now that it was brought to perfection, the perpetrators were more confirmed in the infernal reso-

lution. If any one had dared to suggest its having been done in jest, or denied the existence of a black intrigue, he would have passed for an obstinate fool, if he had not incurred the suspicion of being himself engaged in the plot. With such persuasions on their minds, all were on the alert to discover the guilty; the most indifferent action excited suspicion, suspicion was changed to certainty, and certainty to rage.

As illustrations of this, the chroniclers cite two examples which we will relate.

In the church of Saint Antonio, on the day of some great solemnity, an old man, after having prayed for some time on his knees, rose to seat himself, and before doing so, wiped the dust from the bench with his handkerchief. "This old man poisons the bench," cried a woman, who beheld the action.—The crowd in the church threw themselves upon him, tore his white hair, and after beating him, drew him out half dead, to carry him to prison and to torture. "I saw the unfortunate man," says Ripamonti, "I never knew the end of his painful story, but at the time I thought he had but a few moments to live."

The other event occurred the next day, it was as remarkable, but not as fatal. Three young Frenchmen having come to visit Italy, and study its antiquities, had approached the cathedral, and in passing by, stopped; a circle was formed around them; they were not lost sight of for a moment, having been recognized as strangers, and especially Frenchmen. As if to assure themselves that the wall was marble, the young artists extended their hands to touch it. This was enough. In a moment they were surrounded, and with imprecations and blows dragged to prison. Happily however, they were proved to be innocent, and released.

These things were not confined to the city; the phrenzy was propagated equally with the contagion. The traveller encountered on the high road; the stranger whose habits or appearance were in any respect singular, were judged to be poisoners. At the first intelligence of a new comer, at the cry even of a child, the alarm bell was rung; and the unfortunates were assailed with showers of stones, or seized and conducted to prison. And thus the prison itself was, during a certain period, a place of safety.

Meanwhile, the council of ten, not silenced by the refusal of the wise prelate, again urged their request, which the people seconded by their clamors. The cardinal again resisted, but finding resistance useless, he finally yielded; he did more, he consented that the case which enclosed the relics of San Carlos, should be exposed for eight days on the high altar of the cathedral.

The Tribunal of Health, and the other authorities did not oppose this proceeding; they only ordained some precautions, which without obviating the danger, indicated too plainly their apprehensions. They issued severe orders to prevent people from abroad entering the city, and to ensure their execution, commanded the gates to be closed. They also nailed up the sequestered houses; "the number of which," says a contemporary writer, "amounted to about five hundred."

Three days were employed in preparation; on the 11th of June, the procession left the cathedral at day break; a long file of people, composed for the most part of women, their faces covered with silk masks, and many of them with bare feet, and clothed in sackcloth, appeared first. The tradesmen came next, preceded by their banners; the societies, in habits of various forms and colors; then the brotherhoods, then the secular clergy, each with the insignia of his rank, and holding a lighted torch in his hand. In the midst, amid the brilliant light of the torches, and the resounding echo of the canticles, the case advanced, covered with a rich canopy, and carried alternately by four Canons, sumptuously attired. Through the crystal were seen the mortal remains of the saint, clothed in postifical robes, and his head covered with a mitre. In his mutilated features might still be distinguished some traces of his former countenance, such as his portraits represent him, and such as some of the spectators remembered to have beheld and honored. Behind the remains of the holy prelate, and resembling him in merit, birth and dignity, as well as in his person, came the Archbishop Federigo. The rest of the clergy followed him, and with them the magistrates in their robes, then the nobility, some magnificently clothed, as if to do honor to the pomp of the celebration, and others as penitents, in mourning habits and bare feet; each one, however bearing a torch in his hand. A vast collection of people terminated the procession.

The streets were ornamented as on festival days;

the rich sent out their most precious furniture; and thus the fronts of the poorest houses were decorated by their more wealthy neighbors, or at the expense of the public. Here, in the place of hangings, and there, over the hangings themselves, were branches of trees; on all sides hung pictures, inscriptions, devices; on the balconies were displayed vases, rich antiquities, and valuable curiosities: with burning flambeaux scattered throughout. From many of these windows the sequestered sick looked upon the pomp, and mingled their prayers with the people as they passed. The procession returned to the cathedral about the middle of the day.

But the next day, whilst presumptuous confidence and fanatical assurance had taken possession of every mind, the number of deaths augmented in all parts of the city, in a progression so frightful, and in a manner so sudden, that none could avoid confessing the cause to have been the procession itself. However—astonishing and deplorable power of prejudice! this effect was not attributed to the assemblage of so many people, and to the multiplicity of fortuitous contact, but to the facility afforded to the poisoners to effect their infernal purposes. But as this opinion could not account for so vast a mortality, and as no traces of strange substances had been discovered on the passage of the procession, recourse was had to another invention, admitted by general opinion in Europe—magical and poisoned powders! It was asserted that these powders scattered profusely in the road, attached themselves to the skirts of the gowns, and to the feet of those, who had been on that day barefooted; thus the human mind delights itself with struggling under the weight of phantoms of its own creating.

We conclude the review—not inappropriately—with the following notice from a correspondent.

Mr. Editor:—I have before me a small pamphlet containing Professor Faraday's remarks on the prevention of Dry Rot in Timber. This is a subject almost as interesting here as in England, and from the facts stated, it seems that a remedy for this evil has finally been discovered by a Mr. Ryan. It consists in an application of corrosive sublimate to the wood, which either destroys the seeds of cryptogamous plants vegetating in the wood, or combines with the albuminous matter existing in wood, both of which circumstances have been considered the original causes of the decay, called Dry Rot.

Mr. Ryan, under the sanction of the Admiralty, made many experiments for years, and they appear to have been eminently successful. The timber is prepared by being soaked in a solution of corrosive sublimate; a cube of wood thus prepared, was put into the espetan hole, at Woolwich, a place subject to the fungus rot; at the end of three years it was taken out—it was sound, while the other timber was entirely decayed; it was replaced for two years; at the expiration of five years, it was found perfectly hard and sound, and exhibited no symptom of the least decay. Other experiments equally satisfactory are related.

The application has been made to canvass, &c. placed in a damp cellar for months; the prepared pieces came out sound, while the unprepared were so decayed as not to be capable of being unrolled—the texture of the cloth appears not to suffer by the application. Mr. Ryan has taken a patent for his important invention.

Without any practical knowledge on the subject, I thought a reference to it might excite the attention of some of your readers, better able to investigate the merits, and appreciate the advantages of the discovery.

FOREIGN INTELLIGENCE.

From Paris we have by the Sully our files to the 2d February. They do not furnish any special information.

The Gazette de France of 1st February says, in relation to Spain, "letters from the frontiers speak vaguely of the convoking of the Cortes. The partisans of Don Carlos appear to be concentrating their forces upon Aspetitia. The struggle leads to terrible reprisals, prisoners on either side being daily shot."

We do expect later news, however, from Spain. Meantime we give the annexed from the *Indicateur de Bourdeaux*: "What we have before stated as certain, that the new Minister, *Martinez de la Rosa*, would only consent to enter the Ministry on condition that the Cortes should be convened, has been realized. It was communicated by express on the 25th January, in Bourdeaux, that orders had just been issued by the Spanish Government for immediately convening the Cortes, *par estamentos*."

The capture of *Leyria*, midway between Oporto and Lisbon, on the 15th January, by the troops of the Queen, seems to have been received in Lisbon as a decisive event. It re-establishes the line of communication between the two principal cities of Portugal.

Miguel's troops still held Santaren, contested by 12,000 men, under the *Duke de Terceira*.

The duel between General Bugeaud and *M. Dulong* arose from a discussion in the Chamber of Deputies respecting military obedience. General Bugeaud said—"a soldier's duty was to obey." *M. Dulong* interrupted—"what, obey even to the extent of becoming a gaoler! even to ignominy?" This allusion was to General Bugeaud's having been the commandant at *Blaye* when the Dutchess of Berri was prisoner there. *M. Dulong* was just forty years old, and appears to have been much esteemed.

The debate in the Chamber of Deputies above alluded to, was produced by a measure taken by the government in relation to incorporating naval officers with the artillery, which had been resisted by the officers of the latter corps, many of whom had in consequence been imprisoned.

PARIS, 30th Jan.—A duel had taken place between General Bugeaud and Mr. Dulong, both members of the Chamber of Deputies, in which the latter was killed. The duel arose from a political quarrel.

In our papers, which only go back to the 24th, we do not find any allusion in the Chamber to the Convention of Indemnity with this country.

It is asserted in various letters published in the French papers, that the loss of the French line of battle ship *Superbe* in the gale of 14th and 15th December, (in which the frigate *United States* was also damaged) was occasioned by the insubordination and refusal to do duty, of the crew.

SPAIN

[From the *Journal du Commerce* of 31st Jan.]
MADRID, 18th Jan.—The whole capital is delighted with nomination of *Martinez de la Rosa*, who enjoys unbounded confidence. It is to be hoped that the monarchy will flourish under his wise and liberal administration. The Cortes are to be convoked, it is said, by the first of May. The news of the retirement of *M. Zea* is received with enthusiasm throughout the provinces.

M. Vasquez Figueroa, the newly appointed minister of Marine, has declined in consequence of ill health.

The Count of Toreno, has congratulated the Queen in the name of the provinces. This gentleman is much esteemed by the Government, and it may be expected that he will soon form part of the administration.

The national guard is to be reorganized, upon the same basis as previous to the dismissal of *M. Zea*, but the government will reserve to itself, the selection and appointment of its officers.

The government will soon publish a political manifesto. As the principles of *M. Martinez de la Rosa* are well known, there is no doubt of its being well received by the public.

The King of Denmark has already accredited an ambassador at the government of Elizabeth II. as have the governments of the Hanseatic towns of Germany.

The departure of a Spanish ambassador for Lisbon is spoken of.

The Carlist bands are every where destroyed, thanks to the courage and devotion of the people: with the exception of the inhabitants of Navarre and Biscay, for the obstinacy of the inhabitants of the provinces cannot yet be overcome.

Several individuals attached to the administration, and suspected of Carlistism, have been dismissed.

The Duke of Medina Coeli, grandee of Spain, and member of the council of regency, has given up for

the benefit of the treasury, his salary, amounting to 30,000 francs per annum.

The Director General of the Treasury, Mr. Peres, has announced to the Government that the national expenses for the first quarter of the year 1834, will be promptly met, the estimated revenue for that period having already been secured.

The financial system of M. Gargolis is generally disapproved of. This is not astonishing, for Martinez de la Rosa would not form part of a Cabinet, which would announce a refusal of the engagements of the years 1820 and 1821. Mr. Martinez has always supported the principle that the nation should recognize any debt contracted in the name of Spain by its government.

The Journal des Debats of the 30th January, says that a report had obtained prevalence that day, that Don Carlos had entered Spain at the head of 8000 men. They add, that in all probability there is no foundation for the report, as probably it grows out of a rumor, that the Carlists would renew their efforts during Lent, when the whole of Spain is under the complete dominion of the clergy. They likewise express an opinion that these prophesied disturbances will meet with the same result as those in France, and be entirely unattended to.

We give the following further particulars from

PORTUGAL.

PARIS, 20th January.—The news from Lisbon, by way of London, are favorable to the cause of Donna Maria: her forces have obtained more important advances than have yet signalled their efforts.

Gen. Sandaha, at the head of a division of 5000 men, reinforced by a detachment from the garrison of Peniche, took possession on the 15th January of the city of Leyria, a very strong position between Lisbon and Oporto, and about equidistant between the two. Coimbra it is said, can offer no further resistance, and there is little doubt of the junction of the troops under the command of Sandaha, and those under the command of General Stubbs at Oporto.

The Duke of Terceira, with 12,000 men, is pressing the blockade of Santarem. The force of the Miguelites is reduced to a most deplorable situation.

The capture of Leyria has spread great joy through Lisbon—it is considered as decisive of the fate of the nation. Portugal bode rose in London on the receipt of the news 3 per cent.

PRUSSIA.

BERLIN, 21st January.—It is generally rumored that since the travels of the hereditary prince, he has become strongly inclined in favor of constitutional institutions. There is no doubt that the views of the heir of the throne of Prussia will have a great influence over the proceedings of the Congress of Vienna.

Later from Cadiz.—The ship *Alciopé* has arrived at Boston from Cadiz, whence she sailed on the 7th ultimo. She brings Cadiz papers to the 3d February and Gibraltar papers to the 30th January.

A proclamation was issued by the Governor of Cadiz on the 26th —, which, after reciting that the night before, the rest of the peaceful inhabitants had been disturbed by parties of men perambulating the streets with musical instruments, and sending forth loud cries, and terrific expressions, which the organs of the law alone have a right to utter—made known his Excellency's willingness to sanction decent diversions on the application of respectable persons who could not answer for the maintenance of order, but at the same time strictly prohibited, and denounced the severest penalties against any one who should, by day or by night, send forth cries calculated to offend others, to disturb public tranquillity, or to rouse the passions of the multitude.

In future, the prisoners taken from the insurgents are to be compelled to serve six years, viz: the non-commissioned officers in the regiments or companies belonging to settlements on the coast of Africa or the Havana, and the privates in the corps stationed in Cuba, Porto Rico, and the Philippine Islands. As to the leaders of bands, they will, as heretofore, be dealt with according to law.

Correspondence of the Journal of Commerce.

MARACAIBO, Feb. 14, 1834.

Generals Montilla and Oleari, left this place yesterday, in the English man-of-war brig Victor for Jamaica, on their way to England and France, as Commissioners from Venezuela. There is no news of any kind.

SUMMARY.

United States Ship Fairfield.—It appears from a statement in the Norfolk Beacon, that on the night of November 25th, when President Flores recaptured Guayaquil from Gen. Rocafuerte, a boat was sent on shore from the United States Ship Fairfield, then in the harbor, to ascertain the cause of the firing.

About 11 o'clock the boat returned, having been fired into by the troops of Flores; two of the boat's crew were wounded; one of them, *Henry Young*, had six balls in him, two of which were in his head; he died about half an hour after getting on board; the other man, *Wm. Gunnerson*, had two balls through his body, and his left arm broken; he was recovering. The Fairfield was at Payta 13th Dec. to sail in ten days for Callao, and thence in a few days for Valparaiso.—All well.

OFFICIAL.—The following statement is from John E. Forrest, Secretary to the Commission under the Convention with France, which accompanies a bill now before Congress:

Statement.—The act establishing the commission required that the Board should assemble on the first Monday in August, 1832; but, in consequence of the short interval of time between its passage and the day fixed for the meeting, only one Commissioner attended on that day, and a full meeting was not effected until the 17th September. At this session the Board passed the necessary orders for the government of the claimants in the preparation of their memorials, and adjourned on the 18th September, to meet on the 17th December.

Second session, commenced 19th December, and continued until the 5th March, 1833. During this session 751 memorials were filed; which being examined and disposed of, and the board having no other business before it, adjourned to meet on the 10th of June following.

Third session, commenced 10th June, and continued until the 13th July. During this session 1,314 memorials were filed; and the board having examined and disposed of them, and there being no other business before it, adjourned to meet on the 21st October.

Fourth session, commenced 21st October, and continued until 19th February, 1834. During this session 555 memorials were examined and disposed of, and 230 claims examined, with the proofs filed in support of them.

The whole number of memorials filed, it will be seen, from the foregoing statement, amount to 2,591, and they were disposed of as follows:

1,792 received as settling forth good claims.
485 suspended for further consideration.
142 not received, for defect of form.
172 rejected.

2,501

[From the National Gazette.]

STEAMBOAT WILLIAM PENN.

The undersigned, a Committee of the Board of Directors of the Newcastle and Freetown Railroad Company, having examined into the circumstances connected with the destruction by fire of their fine boat *William Penn*, on the evening of Tuesday, the 4th instant, which was unfortunately attended with the loss of four lives, submit the following as the result of their investigations:

About half past 5 o'clock on the evening aforesaid, the *William Penn*, on her return from Newcastle, having on board about 150 passengers, and being about one mile this side of Gloucester Point, was discovered to be on fire, the flames bursting out with great violence on the windward side of the boat, outside of the larboard boiler near the after end of it. The committee are satisfied that it was communicated to the wood near the boiler by means of a fissure through the sheet-iron-work of one of the return flues of the furnace which had either escaped the vigilance of the workmen by whom it had been examined two days previously, or which was of still more recent origin. The wood which first became ignited was unusually dry, and therefore burnt with great rapidity, and the combustible nature of the bulkheads, and slight upper deck of the boat, together with a strong westerly wind, aided its progress, so that in a few minutes but little hopes were entertained of being able to save the boat. The efforts of Captain Jeffries and his crew to do so, seem, nevertheless, not to have been abated which the slightest chance of success remained. A hole was cut through the upper deck, and a large quantity of water was thrown on the fire, without producing any sensible effect: the hose was rigged to the forcing pump near the bow of the boat, but

so great was the press of passengers in its vicinity, that it could not be worked; and in the meantime the progress of the flames and the alarm had reached such a pitch, that nothing remained to be done but to run the boat ashore, in order to preserve the lives of the individuals on board. The tiller ropes having been burnt, this was promptly effected by means of the starboard engine—when all the passengers (except three, who jumped overboard into deep water and were drowned) were safely landed. The bodies of those who threw themselves into the river, were immediately recovered and conveyed to the city, where every effort was made that medical skill could devise to resuscitate them, but in vain.

One of these unfortunate persons was in the bow of the boat, out of danger, and rushed towards the stern, through the flames to meet his death, by precipitating himself into the water, although begged by Captain Jeffries to remain where he was. The fourth passenger who is deceased was in feeble health, and died the day succeeding the disaster, it is supposed in consequence of having been in the water.

Several horses, a portion of the mails, and the largest part of the baggage, were saved; and no doubt exists in the minds of the Committee that all the passengers might have been rescued without difficulty, but for the panic which is natural, and perhaps unavoidable, on such an occasion. It appears, however, that the greatest presence of mind was preserved by the engineers, firemen, and crew generally, one of whom held up a portion of the bulk head which the fire had forced out, and called to the passengers to go forward, whilst he thus confined the flames and prevented the passage from being interrupted.

As soon as the fire was discovered, the safety-valves were raised, to prevent the additional danger of explosion of the boilers.

Captain Jeffries remained on board, exerting himself to save the property of the passengers after all were out of the boat, and was himself the last person to leave her.

The Committee, in giving these details of the above melancholy disaster, deem it their duty to express their thanks, on behalf of the company, to the master ferryman and the captains and crews of the steam and other ferry boats, both of this city and Camden, as well as to many others, who so promptly repaired to the *William Penn*, and rendered every assistance which the nature of the case would permit.

The Committee, after a very close investigation, are enabled to state their decided conviction, that the persons already announced as dead are all that lost their lives on this distressing occasion.

On the whole, the Committee consider the fire to have been entirely accidental; and while they are of opinion that it ought to induce additional care on the part of those engaged in steam navigation, they are unable to perceive that any want of prudence or caution can be attributed to Captain Jeffries or the persons employed under him; on the contrary, they deem Captain Jeffries entitled to every confidence, and believe that his conduct in the trying circumstances in which he was placed was deserving of the highest praise.

JAMES LEFEVRE,
S. NEVINS,
WM. D. LEWIS,
WM. J. WATSON,

} Committee.

Philadelphia, March 11, 1834.

Extract from a printed circular of Messrs. Baring, Brothers & Co. of London, dated Jan. 22d.

"There has been some demand for American stocks since the beginning of the month, but at low prices; and the amount of various descriptions in the market being large, we do not look for any improvement, particularly as the financial difficulties in the U. S. alarm our capitalists."

LOWER C. VADA.—The address to the King, embodying ninety-two resolutions, demanding the impeachment of a governor-in-chief, &c. finally passed the assembly on the night of the 1st inst., yeas 43, nays 20. An address to the governor, praying him to transmit the address to the King, was also adopted; and the governor received the assembly with their address on the 4th inst. Mr. Morin had been appointed to go to London, as bearer of the resolutions, and about £300 had been subscribed for that purpose.

To the Editor of the New York American :

Sir—I sincerely hope the Hebrew language will henceforth attract the attention of American ladies as much as it has attracted that of their sex in Europe of late years. The advertisement in your columns leads me to cherish this hope. No one, ignorant of the sacred language, can conceive the exquisite feelings which accompany the reading of it. I can never forget my delight at the sweet simplicity of sentences as—"And behold it was very good;" "Fear not Abraham," &c. The awe with which I read those words full of majesty—"Let there be light, and there was light;" nor my wonder when I understood the grammatical meaning of the name of Jehovah. To the refined and pious mind, the reading of the Hebrew Bible is accompanied with pleasure ever new, ever varied, ever thrilling. There, indeed, we drink at—

Siloa's brook that flow'd
Fast by the oracle of God.

Without an intimate acquaintance with Hebrew, we can neither understand many important passages in our Bible, nor feel those many beauties in our own language, which may be called Hebraisms—the incorporating of which, speak so highly in praise of the piety of our forefathers. The illustrious poet of the English language, whom I have just quoted, constantly indulges in these Hebraisms; and his free use of them, has gained for his immortal poem the merit of more sublimity than either the Iliad or the Æneid. The female of taste and education, who has spent days of delight over the Paradise Lost, and thinks she appreciates the sublime bard, must learn Hebrew; and then she will confess, that, comparatively speaking, she had really tasted very few of his refined allusions, and those in a very slight degree. How quickly is the poet appreciated by the Hebrew scholar when he reads Milton's translation of the word *merachepath*, in the 2d v. of the 1st chapter of Genesis, as we have it in his invocation :

Thou from the first
Wast present; and with mighty wings outspread
Dove-like sat'st brooding on the vast abyss,
And mad'st it pregnant.

The remark has been made by a truly learned man, that the fate of the English scholar was a hard one; since he could not really be called such till he had attained an acquaintance with Hebrew. Had he known, as well as I do, the facility with which it is acquired, compared with Latin or Greek, he would have blessed the difficulty which he continued to deprecate all his life. SARNIA.

NORFOLK vs. NEW YORK.—The proprietors of the New York and London line of Packets, have recently announced their intention to reduce the freight of tobacco to 25 shillings per hogshead. This is intended to bring shipments of the article from southern ports, and will have a ruinous effect upon the southern lines of Packet. The line established between James river and Liverpool will be rendered wholly useless by the measure, as it cannot afford to carry the article for less than thirty-five shillings per hogshead. This anticipated result has greatly irritated the good people of Norfolk. Their papers contain several fiery protests against it, and some hot-headed simpleton even talks about "a recurrence to first principles." The fact is, that it is vain, in matters of business, to expect men to be guided by a sense of the interests of others. If New York can make money by the new arrangement, the Norfolk line will have to retire before the superior facilities of their northern competitor.

NAVAL LYCEUM.—We published some days ago, the letter of James Madison, accepting an honorary membership of this institution. We now have pleasure in publishing the letter of JOHN QUINCY ADAMS. Commodore Chas. C. Ridgely, New York, President United States Naval Lyceum:

WASHINGTON, FEB. 24, 1834.

Sir:—I have received your letter of the 14th inst., notifying me of the honor done me by the members of the United States Naval Lyceum, in electing me an honorary member of that institution. I pray you, Sir, to tender to the members of the Lyceum my thanks for this gratifying mark of distinction, and to accept them for the obliging manner in which you have communicated it.

Taught from my infancy to consider the Navy of this Union as our most effective wall of defence; a witness in childhood of that gallantry which, from

that day to the present, has so eminently signalized the career of the mariners in her service, I cannot but take pride in finding myself associated with the members of a profession alike adapted to promote the honor of their country in Peace, as to protect her interests in War, and in the pursuit of purposes which may give energy to the practical skill to be displayed on its appropriate element, by investing it with the progressive improvements of science, and the embellishments of literature and the arts.

I am with great respect, Sir, your ob't serv't,
JOHN QUINCY ADAMS.

THE ANGEL APPEARING TO THE SHEPHERDS.—We have not yet found a moment ourselves to go and look at this new, and as we hear on all sides, fine picture, by COLE. A friend, however, who has just come from there asks room, which we cheerfully make, for the annexed remarks.

COLE'S NEW PICTURE.—We visited the Academy in Barclay street in order to see the new production of one so well known to the public. The picture is certainly beautiful, and the subject appears to us for many reasons, admirably adapted to the pencil. It refers to the solemn communication by the Angel to the Shepherds of the advent of Christ, and the promise of peace and good will on earth to man. The Shepherds are watching their flocks on the plains of Bethlehem; the star which led the wise men shines out in bland radiance, over the sacred spot, while on the other side, the Heavens are drawn aside, and the messenger announces to the affrighted herds, men the tidings of great joy—"Unto you is born this day a Saviour." The lights are well managed, and the repose and stillness of the scene are beautifully portrayed. The figure of the elder shepherd is effective, and the gradations of terror and amazement in all three, is happily conceived. The watchfulness of the dog is contrasted with the sleeping of the goat, who, though standing up, is evidently taking his nap.

We think this picture will add to the reputation of Mr. Cole, and we are sure no one will regret having paid it a visit or two."

[From the Intelligencer of yesterday.]

The President yesterday re-nominated to the Senate the three persons lately rejected as Government Directors of the Bank of the United States. The reasons which he assigned to the Senate for this unusual step, if any, were communicated in confidence, and are of course unknown to us.

OHIO.—The Legislature of this State adjourned on the 3d inst. The Columbus Journal furnishes the following list of monied incorporations created by the Legislature at the recent session:—

NAMES.	CAPITAL.
Ohio Life Insurance and Trust Company	\$2,000,000
Lafayette Bank of Cincinnati	1,000,000
Clinton Bank of Columbus	300,000
Bank of Cleveland	300,000
Bank of Massillon	200,000
Bank of Circleville	200,000
Bank of Wooster	100,000
Bank of Xenia	100,000
Bank of Sandusky	100,000
Bank of New Lisbon	100,000
Total	\$4,400,000

[From the Charleston Courier of March 3.]

COTTON.—There was less doing in this article than during the previous week, owing, in a great measure, to two or three days of bad weather, and the Races. Holders, however, have remained firm, and former prices were fully maintained. The late news from Liverpool, received on Saturday, had no visible effect upon the prices in this market—sales having been made after the receipt of these accounts, at about former rates. The total sales of Upland amounted to upwards of 3000 bales, viz:—33 bales at 10 cents—20 at 10½—104 at 10½—332 at 10½—376 at 11—260 at 11½—284 at 11½—363 at 11½—67 at 11½—80 at 11½—351 at 12—124 at 12½—194 at 12½—194. The transactions in Sea Island and Mains were fair at from 20 to 25 for common, and upwards for finer description. Sales of all description meet with ready sales. We quote Sea Island and Mains, common, 30 at 95; fine do. 96 and upwards; Santos, 18 a 21; Short Staple, inferior to middling, 10 a 10½; fair to good, 11 a 11½; prime to choice, 12 a 12½.

RICE.—We have no alteration to make in the price of this article. A little more inquiry was experienced for middling qualities, and holders are generally firm. The sales amounted to upwards of 3000 bbls. viz:—197 bbls. at 9½—264 at 9½—16—530 at 21—231 at 21—176 at 21—185 at 21—130 at 21—150 at 21.

New England Banks.—The amount of Country Bank notes exchanged at the Suffolk Bank during the last year, was eight millions of dollars, of \$386,000 a day.

[From the Roseville (Ohio) Telegraph.]

INDIAN HOSTILITIES NEAR HOME.—The following are the incidents of an affray which has produced here considerable excitement:

Mr. L. B. Bartlett, agent of the celebrated Miami chief, Godfrey, passed through this place in company with Poqua, son of Godfrey, on their return from Cincinnati to the residence of the latter near Fort Wayne, Indiana, on Thursday, 7th inst. They stopped at a public House 4 miles west of this. A short time after going to bed, Poqua having gotten up on some false pretext, and provided himself with a dirk from his saddle bags, sounded the accustomed war whoop in the ear of his astonished fellow traveller, and stabbed him through the arm. Both instantly sprang to the floor, and a desperate struggle ensued—the Indian still uttering his fearful yells and occasionally wounded Bartlett. The noise awakened a number of individuals who rushed into the room. Mr. Clendinning, the landlord, entered first, with a candle; this the savage struck out and stabbed M. C. in the chest. Messrs. J. and W. M. Whitney next entered; the former of whom he wounded in the shoulder; the latter, like Achilles, received a stab in the heel. A Mr. Hipes next advanced—him he wounded in the arm. The next thrust was at Mr. Bruce, which passed through his clothes. Having lost his dirk accidentally he now commenced with his fists, and soon remained sole master of the room, where he was blockaded until morning, when he quietly gave himself up. He is now in our county jail. No adequate cause for his conduct has been assigned. The manner of the agent, Mr. B., towards him, appears to have been invariably kind, and Poqua has heretofore sustained a high character. It is supposed that none of the wounds are fatal, though Mr. Clendinning and Mr. Bartlett are seriously injured—the latter in five places.

NEW ORLEANS 25 FEB.—A Riot.—On Friday night last a serious disturbance took place among the Irish laborers employed in digging the upper canal and some of a different section of the country, who were employed in making and repairing the Levees down the coast. It appears that a man named Allahan, had failed to obtain a job of work, and therefore was determined to impede its progress of his successful competitor, and in the course of Friday went down to the Coast with his band to put his threats in execution; finding his party too weak, he said he would fetch a gang that would flog them and left the ground. Late in the night he returned, with a gang from the Canal, and fell upon his opponents, and beat them, and maltreated them most brutally—the result of which was that three of them have died from their bruises, and many more are severely hurt. During Saturday the Police were actively engaged in detecting some of the offenders, and three or four were arrested. On Saturday night, however, the attack was again resumed, and the attention of the Police was called to a gang of the desperadoes, armed with muskets and fowling pieces, collected on the Gentry Ridge. They had worried and beaten, so we learn, several negroes on the different plantations. The guard immediately repaired to the spot, when they were met by a discharge of musketry, one ball striking the musket of one of the guard, cutting it asunder and wounding the man. The guard returned the fire and finished by taking 23 of these ruffian pioneers and bringing them to prison, where they are now confined. On Sunday night a party of these same men entered the miserable dwelling of an old woman and her daughters, and beat them most cruelly, and so they continued their practices until the Police checked them in their murderous career. Parties of three and four of these ruffians, armed, were met by the guard, and arrested, on Sunday night, and conducted to prison. It is really somewhat alarming that these men, disregarding the rights of their fellow men, should thus put a whole community into commotion. Such acts as these can by no means have a beneficial tendency, and the result will be that rather than encourage them at all, other men will obtain a higher price for work, which, perhaps, will not be so well executed. We do sincerely hope that the offenders will be brought to justice, and above all, the leader of this riot, Allahan.

Yesterday an affray took place on the Levee between two boatmen, which terminated in the death of one. The particulars of the quarrel we have not yet learned. The offender was immediately arrested by the police, and is now awaiting his examination before the Mayor.—[New Orleans Mer. Adv.]

The old line of Liverpool packets—the establishment of which all admit to have given the first great impulse to that regularity, despatch and certainty, which now characterize our intercourse with the chief ports of Europe—has recently, as we have before stated, passed into new hands.

Two regulations have been recently introduced, which seem to meet with universal approbation. The one fixing the price of passage at *one hundred and twenty dollars, without liquors*—thus exempting those passengers who do not use them, from contributing to pay for those who do—while to the latter the steward will always be prepared to supply at a fixed rate, such wines &c. as may be desired. The other is, that when the regular day of sailing falls on a Sunday, the vessel will be detained till Monday. This, as a mere matter of business, is a great convenience, as it gives to shippers, the chance of another day's mail to forward the latest accounts to their correspondents; and enables them, moreover, to close their most important letters on the very day of the vessels sailing; which, when that occurred on Sunday could not be. This will be felt by all merchants to be of itself a great advantage.

The line of London packets have, we understand, also adopted these regulations—which, it is reasonable to presume, receiving as they seem to do, the unanimous approbation of the business classes—will be in like manner adopted by the various other lines of European packets.

NAVAL LYCEUM.—Although, amid the more engrossing topics of the day, little has been lately said in our paper of this excellent institution, it does not, we are glad to find, cease to interest the public. We received, a day or two ago, a fine fruit piece from the Hope gallery, intended for the Lyceum; and now we have pleasure in publishing an excellent letter from James Madison, accepting an honorary membership in that association.

MONTPELIER, FEBRUARY 20, 1834.

Dear Sir:—I have duly received your letter, notifying the honorary membership conferred on me by the "United States Naval Lyceum, New York." The laudable objects of the Institute, and the names with which mine is associated, give the distinction a value, which claims the special acknowledgments which I beg may be accepted. I must at the same time express my sensibility to the very kind terms in which the communication is made to me, and the gratification I must always feel, in reflecting, that selections made for the Naval Service of the United States, whilst the Executive was in my hands, were so well justified by a brilliancy of career in war, and an honorable usefulness in peace.

Be pleased to accept for yourself my cordial respects and salutations. JAMES MADISON.

Commodore CHARLES G. RIDGELY.

JOHN BREATHTITT, Governor of Kentucky, died of consumption, at the seat of Government, Frankfort, on Friday the 21st ult.

On Saturday, James T. Morehead, Esq. Lieut. Governor, was qualified and entered upon the duties of his office as Governor, in consequence of its vacation, by the death of Gov. Breahtitt. James Guthrie, Esq. of Louisville, was elected Speaker of the Senate, in the place of the Lieut. Governor.

APPOINTMENTS—FEBRUARY 25, 1834.

By the Governor, with the advice and consent of the Senate.

NEW YORK—David Austin, William G. Bull, Thomas P. Bowne, John J. Bedient, Anthony W. Bleecker, James Bleecker, Jacob Burdett, Wm. J. Brown, Thomas Bell, Joseph W. Corlies, Richard Crawford, John P. Dieterich, Joseph Daymon, Isaac T. Doughty, Wm. H. Franklin, James Gourlay, Wm. Gerard, James N. Giffing, Lindley M. Hoffman, Peter M. Halstead, John Herriman, George Innis, Sidney P. Ingraham, Samson M. Isaacs, Elisha Kingsland, Aaron Levey, Richard Lawrence, John Langdon, Gilbert Lewis, Wm. M'Laughlin, Wm. M'Donnell, Wm. D. M'Carty, Rowland R. Min-

turn, James M. Miller, Robert Charles Morris, Geo. M'Kay Morrill, Geo. S. Munn, Aaron B. Nones, Samuel Philips, John Pearson, Thomas W. Pearsall, Lawrence Power, Henry L. Patterson, James C. Smith, Solomon Seixas, Daniel Sparks, Charles B. Spicer, Wm. Timpson, Edward G. Thompson, Abraham Waterhouse, Jacob Van Winkle, and Charles N. Yeoman, auctioneers. Samuel Satterlee, jr. measurer of grain. Judah Hammond, Justice of the marine court. John Wright, Samuel W. Disbrow, Isaac L. Tompkins, Oliver H. Tompkins, Cornelius Timpson, Samuel Clark, John Vredenburg, Lewis Smith, Jacob Brinckerhoff, J. G. Ketchum, Edward Webb, Oliver Holden, Ebenezer Briggs, Joseph Earle, Gilbert Perkins, Jobert T. Clark, and Tobias L. Stoughtenburgh, measurers of grain.

[From the Journal of Commerce.]

COUNTRY BANKS.—Through the kindness of a gentleman connected with one of our Banking institutions, we are enabled to lay before our readers a list of those country Banks which redeem their bills at Banks in this city. There are thirteen, of which the bills, of all denominations, are redeemable in New York; and of these, eight have assumed this new relation within the last ten days. The names of such are printed in italics. The other five have been long in the habit of redeeming their notes in this city. Of the whole thirteen, all are Safety Fund Banks except two. Seventeen other country Banks redeem their bills, of and above a certain denomination, at the Banks in this city. The annexed schedule gives the particulars:

List of Banks whose Bills are redeemed in New York.

<i>Newburg Bank</i>	<i>N. Y. State Bank, at Albany</i>
<i>Brooklyn Bank, L. I.</i>	<i>Mechanics' and Farmers' Bank,</i>
<i>Long Island Bank, Brooklyn</i>	<i>at Albany</i>
<i>Dutchess County Bank</i>	<i>Catskill Bank</i>
<i>Hudson River Bank</i>	<i>Westchester County Bank</i>
<i>Poughkeepsie Bank</i>	<i>Canal Bank, Albany</i>
<i>Bank of Troy</i>	<i>Farmers' Bank, Troy</i>
<i>Farmers' & Mechanics' Bank, Rahway</i> 5's and upwards
<i>State Bank, Elizabethtown</i> 5's and upwards
<i>Newark Banking and Insurance Co.</i> 5's and upwards
<i>Trenton Banking Co.</i> 5's and upwards
<i>State Bank, Newark</i> 5's and upwards
<i>Mechanics' Bank of Newark</i> 5's and upwards
<i>State Bank, New Brunswick</i> 5's and upwards
<i>State Bank, Morristown</i> 5's and upwards
<i>Commercial Bank, Amboy</i> 10's and upwards
<i>Belvidere Bank, N. J.</i> 10's and upwards
<i>Orange Bank of Essex</i> 10's and upwards
<i>Mech. & Merch. Bank, Middlet'n Point</i> 10's and upwards
<i>Bank of Albany</i> 30's and upwards
<i>Saratoga County Bank</i> 50's and upwards
<i>Commercial Bank, Albany</i> 50's and upwards
<i>Lansingburg Bank</i> 50's and upwards
<i>Troy City Bank</i> 100's and upwards

Several Banks issue more or less Notes drawn payable in New York.

Disaster at Sea.—The schr. Mary Francis, Capt. B. Kirwan, of East River, which sailed from that place about 15 days ago, bound to the West Indies, returned there last Friday night in distress. She was run foul of, on the night of the 14th, in the latitude of Bermuda, by the ship Triton, bound to Portsmouth, (N. H.) from the South Sea. The ship had all sail set and was going nine or ten knots, and struck the schooner on the starboard quarter, knocked Capt. Kirwan and one of his men overboard; the man was lost, and Captain Kirwan had his right arm and leg broken, and otherwise dreadfully mangled; notwithstanding which he got hold of a rope with his left hand, and held on for half an hour, before his cries were heard, and then there were only two men on board, (the other two having got on board the ship when in contact.) It was two or three hours before the ship got in sail, and returned to the schooner; they lay by her until daylight, when she left her. The schooner is quite new, and is a very strong vessel, consequently did not receive as much damage as might have been expected; she lost three stanchions, the rail waist and part of the taffrail, but does not leak more than she did before the accident.—Capt. Kirwan's sufferings are most excruciating, and if his life is saved, it is feared he will lose his leg. The ship was before the wind, and the schooner was close hauled; they saw each other quarter of an hour before they came in contact, and Captain Kirwan used every exertion to get of the way, but as his vessel was under easy sail, he could not keep clear of the ship. Capt. Kirwan does not know how he got hurt, and has no recollection of any occurrence after the ship struck, and he was twenty yards astern of the vessel with a rope in his hand, and although she was going two or three knots, he contrived to haul himself up with one hand until he reached her before they heard him on board. The Captain of the ship was below. The ship's head and bowsprit were carried away, and part of the

head fell on the schooner's deck. The schooner is loaded with flour and corn, belonging to some persons in Fredericksburg; she will repair damages and proceed on her voyage the last of the week, under the command of Capt. Kirwan's son.—[Norfolk Beacon.]

APPOINTMENTS BY THE PRESIDENT,

By and with the advice and consent of the Senate. John G. Mawney, Surveyor and Inspector, East Greenwich, R. I.

Samuel Brown, Naval Officer, Providence, R. I.

David Henshaw, Collector of Customs, Boston, Mass.

John McNeil, Surveyor and Inspector, for the same port.

George Brent, Collector of Customs, Alexandria, D. C.

(The above are all re-appointments.)

Armsted D. Carey, Receiver at Sparta, Alabama, in place of I. S. Hunter resigned.

James H. Weakley, Surveyor General of Public Lands in Alabama, in place of John Coffee, deceased.

Alexander Hunter, to be Marshal for the district of Columbia, in the place of Henry Ashton deceased.

Byrd Brandon to be Attorney for the Northern District of Alabama, re-appointed.

Garret D. Wall to be Attorney for the District of New Jersey, re-appointed.

Daniel Kellog to be Attorney for the District of Vermont, re-appointed.

Benjamin F. Linton to be Attorney for the Western District of Louisiana, re-appointed.

David C. Wilson to be Marshal for the District of Delaware, reappointed.

Augustus Jones to be Marshal for the District of Missouri, reappointed.

Heman Lowry to be Marshal for the District of Vermont reappointed.

William Lyon to be Marshal for the Eastern District of Tennessee, reappointed.

John McCalla to be Marshal for the District of Kentucky, reappointed.

Thomas B. Monroe to be Judge for the District of Kentucky in the place of John Boyle, deceased.

The Canals, according to a statement by authority in the Albany Argus, will be open for navigation on the 17th April. The water will be let in, and the whole extent be navigable on the morning of that day.

The Mobile Register of February 22d, says, "The Branch of the United States Bank in that City has resumed the purchase of foreign exchanges. The rates have not come to our knowledge.

The Mechanics' Bank of this city have received funds from the Government, with which to pay those pensioners whom the Bank of the United States have been prohibited, by the Secretary of War, from paying.

THE SILK WORM.—BY MRS. SARAH JANE HALE.

There is no form, upon our earth,
That bears the mighty Maker's seal,
But has some charm—to draw this forth,
We need but hearts to feel.

I saw a fairy young girl—her face
Was sweet as dream of cherish'd friend;
Just at the age when childhood's grace
And maiden softness blend.

A silk worm in her hand she laid,
Nor fear, nor yet disgust was stirred;
But gaily with her charge she play'd
As 'twere a nestling bird.

She raised it to her dimple cheek,
And let it rest and revel there—
O, why for outward beauty seek!
Love makes its favorites fair.

That worm—I should have shrunk, in truth,
To feel the reptile o'er me move,
But loved by innocence and youth,
I deemed it worthy love.

Would we, I thought, the soul imbue,
In early life, with sympathies
For every harmless thing, and view
Such creatures formed to please;
And when with usefulness combined,
Give them our love and gentle care—
O, we might have a world as kind
As God has made it fair!

There is no form upon our earth,
That bears the mighty Maker's seal,
But has some charm—to call it forth,
We need but hearts to feel.

There is good sense and sound argument in the annexed remarks from the Journal of Commerce.

EXCHANGE IN CHINA.—It is mentioned in the letters from Canton, that bills of Exchange drawn by the United States Bank upon their bankers in London, had been sold at the rate of 4s. 4d. per dollar, while there was no sale at all for private bills. The fact is worthy of a moment's consideration, as illustrating the importance of such an institution. The China trade was formerly carried on almost wholly by exporting silver dollars. But within a few years past, the Chinese, perhaps having satisfied themselves with making silver gods, have turned their attention to articles of more substantial importance. They purchase large quantities of British goods, which renders exchange on London as good to them as dollars and better. But at such a distance and under the circumstances which exist, it is impossible to establish private credit firmly enough to sustain so large a business, under all the fluctuations of opinion. Generally to be sure, private bills have been negotiated with success, but nothing short of a great national institution has sufficient notoriety and firmness of responsibility to resist the suspicions which occasionally spring up. By means of bills of exchange, our teas and silks from China are paid for by the products of our own soil. For, the bills drawn on London and sold in Canton, are met and paid by funds resulting from sales of Cotton and other articles in the ports of Europe. The great expense and risk of exporting specie is saved, and one cause of fluctuations in the money market avoided. A ship sails to Canton for a cargo of great value, and her whole outward cargo consists of three or four slips of paper, six inches by four. If the whole cargo is lost, every thing is saved.—Pirates may capture it, or the fire burn it, still it is safe, and in possession of the rightful owner.

We know there are some persons who consider credit a dangerous thing. They say it induces over trading, and brings on fluctuations and ruin. If this were ever so true we prefer fluctuations to total inaction. It is better that there should be failures occasionally, and that some individuals should be disappointed in their golden expectations, than that the whole country should lie dormant and stupid. It is better that the nation should march on rapidly in wealth and comfort, though a few individuals may encounter misfortune, and share less than they wished, in the general prosperity.

In the case of the China trade, it is evident that the bills of exchange answer every purpose of specie. The credit is as good as the silver. And the saving of expense enables the people to be furnished with teas and other articles of comfort or luxury, much cheaper than they could otherwise be furnished. Why then should the specie be carried around the world, when credit is the most convenient and economical article. If it were necessary to embarrass enterprise at all, it might better be done in some cheaper way. But no such embarrassments are necessary or proper. It would be as wise to deny to men the use of steam, lest they should drive too furiously, as to deny them the use of credit lest they should overtrade. All that is necessary, is, a steady and wise management, and credit becomes as safe as cash, and steam as safe as the dullest donkey.

SINGULAR OLD SONGS.

The longer life, the more offence;
The more offence, the greater pain;
The greater pain, the less defence;
The less defence, the lesser gain—
The loss of gain long ill doth try:
Wherefore, come, death, and let me die!
The shorter life, less count I find;
The less account, the sooner made;
The count soon made the merrier mind;
The merrier mind doth thought invade—
Short life, in truth, this thing doth try:
Wherefore, come, death, and let me die!
Come, gentle death, the ebb of care;
The ebb of care, the flood of life;
The flood of life, the joyful fare;
The joyful fare, the end of strife—
The end of strife, that thing wish I:
Wherefore, come, death, and let me die!

[From the Boston Atlas.]

TO A TYRANT—CONTEMPLATING A TRIP TO ARABIA.

Farewell! Go seek the desert sands,
Less barren than thy heart and brain;
And o'er the roving Arab bands,
In absolute dominion reign:
To pity they have stolen their souls;
They thirst for battle and for spoil;
Prompt to all deeds of violence,
Eager for blood, and apt for spell.
There every sight thou meet around,
A mirror of thy mind will be;
And every fierce, tumultuous sound
Will echo thine own thoughts to thee:
Thy present friends would only care
To help thee on a little farther;
Congenial horrors wait thee there,
Congenial souls will call thee MASTER!

TO STEAMBOAT COMPANIES.

PROFESSOR RAFFINISQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid. S. I. R. J. M. & F.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York, }
January 29, 1833.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine.
MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.
J31 6t

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.
Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. H. GILL, Civil Engineer.

Germanstown, February, 1833.
For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY K. CAMPBELL, Eng. Philad.,
Germantown, and Norrist. Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 35 1t

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.
m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' instruments of your Manufacture, particularly Spirit levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing & Heartt.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any person desirous of procuring the same.

[From the Token for 1834.]

FLOWERS—BY MRS. SIGOURNEY.

I'll tell thee a story, sweet,
Here under this shady tree;
If thou'lt keep it safe in thy faithful breast,
I'll whisper the whole to thee.

I had a lover, once,
In my early, sunny hours,
A fair and fanciful youth was he,
And he told his love in flowers.

I remember its waking sigh—
We roam'd in a verdant spot,
And he culled for me a cluster bright
Of a purple forget-me-not.

But I was a giddy girl,
So I toss'd it soon away,
And gather'd the dandelion buds,
And the wild grape's gadding spray.

He marked their blended hues,
With a sad and reproachful eye,
For one was the symbol of thoughtless mirth,
And one of coquetry.

Yet he would not be baffled thus,
So he brought for my crystal vase,
The rose geranium's tender bloom,
And the blushing hawthorn's grace.

And a brilliant and fresh bouquet
Of the moss-rose buds he bore—
Whose eloquent brows, with dew-drops pearl'd,
Were rich in the heart's deep lore.

I would not refuse the gift,
Though I knew the spell it wove,
But I gave him back a snow-white bud,
"Too young, too young to love."

Then he proffer'd a myrtle wreath,
With damask roses fair,
And took the liberty—only think—
To arrange it in my hair.

And he press'd in my yielding hand,
The everlasting pea,
Whose questioning lips of perfume breathed
"Wilt thou go, wilt thou go with me?"

Yet we were but children still,
And our love, though it seemed so sweet,
Was well express'd by the types it chose,
For it pass'd away as fleet.

Though he brought the laurus leaf,
That changes but to die,
And the amaranth, and the evergreen,
Yet what did they signify.

Of o'er his vaunted love
Suspicious moods had power,
So I put a French marigold in his hat,
That gaudy, jealous flower.

But the ruthless passion shrank
Like Jonah's gourd away,
Till the shivering ice-plant best might mark
The grades of its chill decay.

And he sail'd o'er the faithless sea,
To a brighter clime than ours—
So it faded that fond and fickle love,
Like its alphabet of flowers.

I'll be a fairy, and drink the dew,
And creep through the honied flowers,
And sleep in the violet's tender blue,
And dance in the evening hours.

My music shall be the soft low gales
Which sigh through the dark green trees,
And heaven's breath swell the gossamer sails
With which I swim the breeze.

The glow-worm shall be my gentle light,
And a lily's cup my bed;
And I'll warm me in the sweet moon-light,
And on fallen roses tread.

And ever fresh the grass shall grow
Around my mystic ring,
And little murmurs, sweet and low,
Shall answer when I sing.

And I will hold a fairy court,
And call each slumbering fay,
And wild and gaily will we sport,
As the twilight fades away.

I'll be a fairy and drink the dew,
And creep through the honied flowers,
And sleep in the violet's tender blue,
And dance in the evening hours.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A291 R M & F

Those papers with which the American exchanges, and in which the following advertisements are inserted, will confer a favor on the subscriber by giving the following a few insertions:

Subscribers who are indebted for the *New York American*, the *Railroad Journal*, *Mechanics' Magazine*, or *New York Farmer*, are respectfully requested to remit the amount by merchants, or other gentlemen visiting the city *this spring*, and, if possible, in notes of the United States Bank, or its Branches, as the expense of postage and the discount on notes of distant Banks, is a great tax upon the Office.

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the *LONDON MECHANICS' MAGAZINE*, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published. D. K. Minor also publishes the *NEW-YORK AMERICAN*, daily, tri-weekly, and semi-weekly.

Also, the *PLOUGH-BOY*, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber. D. K. MINOR, 35 Wall street. New-York, August 14, 1833.

FOR SALE,

ATLANTIC JOURNAL AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Rafinesque, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. dedicated to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 100 plates, containing also the economical properties of 500 genera of American plants. \$3.

MANUAL OF AMERICAN VINES, and Art of Making Wines, with 8 figures. 25 cents.

FISHES AND SHELLS OF THE RIVER OHIO. 1 dollar.

AMERICAN FLORIST, with 36 figures—price 36 cts. Orders for these works, or any other of Professor Rafinesque's, received at this office. A91 J M & F

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his caveats filed in the Patent Office. Apply, post paid. 81 R J M & F

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 8th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the *Mechanics' Magazine*; Messrs. Rushton & Asplwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means. 81 R J M & F

RAILWAY IRON.

				Flat Bars in
Ninety-five tons of 1 inch by 1 inch,				lengths of 14 to 16
200 do. 1 1/2 do. do.				feet counter sunk
40 do. 1 1/2 do. do.				holes, ends cut at
800 do. 2 do. do.				an angle of 45 de-
800 do. 2 1/2 do. do.				grees with splin-
soon expected.				g plates, nails
				to suit

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 2 3/4, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment. A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those desirous to examine them. d71meowr

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 2d, 1833. For further information on this subject see No. 40, page 772 of this Journal. dt

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by J. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 229 Water street, New-York; A. M. Jones, Philadelphia; T. Jauviere, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

H. BURDEN.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MARCH 22, 1834.

ERRATA.—In the article on *Blanchard's boat*, page 117, vol 3, No. 8, 1st column, for "Dunkirk," read "*Portland*"; 2d column, for "enterprise of Philadelphia," read "*Pennsylvania*."

PENNSYLVANIA PORTAGE RAILROAD.—By the following extract from the *Pittsburgh Gazette*, we learn that the Portage Railroad is now ready for use. This is a very important link in the improvements in Pennsylvania. It opens a direct intercourse between Philadelphia and Pittsburgh, and notwithstanding the trouble and delay of a transfer of freight from boats to railroad cars, and again to boats, Philadelphia will derive immense benefit from the work.

Portage Railway Office,
Hollidaysburgh, March 13, 1834.

Dear Sir,—It will, doubtless, be gratifying to the citizens of Pittsburgh to learn that the Portage Railroad will be opened for public use on Tuesday, the 18th instant. The Western, Juniata, and Eastern Divisions of the Canal are filled, and ready for transportation—therefore, on that day, a line of communication will be opened, uninterrupted, between your city and Philadelphia.

The rates of Toll to be received on the Portage have been fixed by the Board of Canal Commissioners at double the amount chargeable on the Pennsylvania Canals.

Very respectfully, &c.

S. JONES, Superintendent.

Colonel Macerone's Steam Carriage.—Thursday, the Steam Carriage for which Colonel Macerone and Mr. Squire have obtained a patent, and which has been running from Oxford street to Edgware for the last fortnight, made a trip to Uxbridge, and, notwithstanding the extremely disadvantageous state of the road, owing at once to the long-continued rains, and to the quantity of loose gravel which is at present being laid down upon it, the trial afforded another unequivocal proof of the success which has attended the efforts of the patentees in bringing to a comparative degree of perfection the construction of locomotive carriages. The road, which, even in fine weather, is a very bad one, was, as before mentioned, in the worst possible condition, and yet the journey from the Regent's circus, Oxford street, to Uxbridge, was performed (not taking stoppages into account) in an hour and a quarter. The consumption of time in the stoppages for the purpose of taking in water and fuel was, of course, considerable, but that is a matter that can be easily remedied by the establishment of stations at proper distances, and with suitable apparatus, upon any road on which a carriage of the kind can be started. The first two miles were performed in seven minutes and a half, and the average rate of speed was 12, 14, and sometimes 16 miles an hour. Indeed, it was manifest that in summer, and upon a good road, the coach could go even 20 miles an hour. Up some of the hills, which had been thickly covered with gravel, it went at the rate of eight miles an hour. On his return to town, one of the Oxford stages in full gallop passed it, while taking in water at Kensington. After the lapse of a few minutes the steam carriage followed, came up with the stage, still at full gallop, passed it, and left it "nowhere" ere it had arrived at the commencement of Oxford street. This carriage, we understand, has already run 2500 miles without being detained on the road for a single minute by any derangement of the machinery, save the breaking of the axle-tree on its return from Windsor in last September—an accident to which every other species of vehicle is equally liable, and against the recurrence of which, in the instance of the steam-carriage, the patentees state they have effectually provided. It is the intention of the patentees, we believe, to continue running the carriage for some days longer to the Uxbridge, when it will be discontinued. They at the same time express their willingness to run the carriage, for the purpose of showing the power of the engine, upon any road in the kingdom.—[English paper.]

DIP AND DECLINATION OF THE NEEDLE IN AMERICA.—A manufacturer of compasses at Birmingham would feel much obliged to any of our American or other correspondents, who would supply answers to the following queries: What is the dip and declination of the needle in New-York? and the extent of the variation throughout that and the other states of the North American Union?

On the Location of Railroad Curvatures, being an investigation of the principal formulas required for field operations in laying curves to pass through given points. By J. S. VAN DE GRAAFF. To the Editor of the American Railroad Journal.

SIR,—Having been personally engaged in tracing the various curves for railroad lines, and being frequently under the necessity of making calculations relative to divergent curves and tangents, under a variety of existing circumstances, I was induced to enter into an investigation of certain formulas, embracing the principal cases which usually occur in practice. These formulas, the chief of which I believe to be new, are now offered to you for insertion in your Journal. This is done only with a view to the possibility of adding a small mite to the general stock of information upon that subject; for nothing can be better calculated to produce such an effect than a comparison of the different methods of computation which have been resorted to by different individuals engaged in the solution of such problems. A full investigation of this subject, embracing all the variety of cases which occur in the field, would require too much room in your columns, and I have therefore consulted brevity as much as perspicuity would allow. Very respectfully,

J. S. VAN DE GRAAFF.

ART. 1. Any two points being fixed in the general direction of a route, through which it is proposed to lay a line of railroad composed of several curves and tangent lines, the cost of construction is in most cases not the only requisite datum to fix the definite location of the intermediate points,—for there are very few varieties of ground, except in a very broken country, which will not admit of several different lines connecting the same points, all at nearly an equal expense of construction, and all within the same limits of curvature. It then becomes an object to make such a selection of right lines and curves, and such a distribution thereof, as will produce, at a given expense, the most efficient road.

But no particular rule can be given as a guide for the judicious arrangement of a line; and the general object here proposed is an investigation of such formulas as are required in the field. Let any two rectangular co-ordinate axes be assumed, and take any number of equal

straight lines, originating at the origin of the co-ordinate axes, and connected together at their extremities in such a manner, as that, when each point of connection is joined by a straight line to the origin, these latter lines will form, with one of the co-ordinate axes, a series of angles in *arithmetical progression*. It then follows, agreeably to the principles of elementary geometry, that each point of connection of those equal straight lines, will be situated in the circumference of a circle, passing through the origin, and touching that co-ordinate axis from which the arithmetical series of angles is counted. And this obviously suggests the common method of tracing a circular arc in the field by means of a chain whose length is each of those equal straight lines, and an instrument for measuring the arithmetical series of angles from the tangent line.

In all the formulas which will be deduced in the course of the present inquiry, it must be remembered that all measurements of distance are supposed to be made in chains, or decimal parts of a chain. The chain will therefore be the *unity* of length, and may have any value whatever; but as this will be a constant quantity in the field, it follows that the *curvature* of a line, traced in the manner just described, can only be made variable by different arithmetical series of angles. The *common differences* of these series of angles will therefore be called the *moduli* of curvatures, and will always be denoted by a letter *T*. That co-ordinate axis which coincides with the tangent line will be designated as the axis of *x*; the other being that of the ordinate *y*; and any curve will be considered given, or found, when the modulus of curvature is given, or found.

2. Let a given curve be traced from the origin of a system of rectangular co-ordinate axes, agreeably to the preceding article; it is proposed to investigate formulas which will express the values of the co-ordinates of the station at the extremity of the *n*th chain.

The inclinations of the different chains to the axis of *x*, in succession from the origin, are respectively *T*, *3T*, *5T*, &c.; and consequently their projections upon the co-ordinate axes are obviously $\cos. T$, $\cos. 3T$, $\cos. 5T$, &c., and $\sin. T$, $\sin. 3T$, $\sin. 5T$, &c. respectively. Hence, by taking the sums of those projections, the following equations will result:

$$x = \cos. T + \cos. 3T + \cos. 5T + \dots \dots \dots \cos. \{T \cdot 2n-1\}$$

$$y = \sin. T + \sin. 3T + \sin. 5T + \dots \dots \dots \sin. \{T \cdot 2n-1\}$$

The last term in each of these two series will obviously be the *n*th term; and the sum of *n* terms of each series being taken, agreeably to the known principles of analytical trigonometry, the following formulas will be the result:

$$x = \frac{\sin. 2nT}{2 \sin. T}$$

$$y = \frac{1 - \cos. 2nT}{2 \sin. T}$$

These are the expressions required; and they have that form which is most convenient for computation from a table of natural sines and cosines.

3. To find the radius of curvature.

It is sufficiently evident, that when *n* is made variable, the maximum value of *x* will be the radius of the described circle; but when *x* is a maximum, it follows that $\sin. 2nT$ will also be a maximum when *T* remains constant, as will readily appear from the expressions obtained in the last article. Now, the maximum value of $\sin. 2nT$ is unity, and consequently denoting the radius of the described circle by *R*, the result is,

$$R = \frac{1}{2 \sin. T}$$

4. Take two rectangular co-ordinate axes, having their origin at a given station in a tangent

line, from which a certain required curve is to be laid, passing through a point designated by the co-ordinates *x*, *y*; the given tangent line coinciding with the axis of *x*. Parallel respectively to each of the coordinate axes, let any number of rectangular lines be traced from the origin, and terminating in the point designated for the required curve to meet; these rectangular lines being selected in any convenient manner to pass any obstacle which may happen to occur. Let the algebraic sums of each of these rectangular lines be taken, agreeably to the axis to which they are respectively parallel. These sums will obviously give the values of the co-ordinates *x*, *y*; and from thence it is proposed to determine a formula expressing the value of the modulus of curvature of the required curve.

Let each of the two formulas obtained in art. 2 be squared; and let the second of the two formulas be then divided by the sum of the squares. The following expression will be the immediate result:

$$\sin. T = \frac{y}{x^2 + y^2}$$

And thus the modulus of curvature of the required curve becomes known. This is one of the most important formulas used in the field; for it can be applied under any circumstances, when the designated point is not visible from the origin. If that point can be seen from the origin, the curve sought is usually obtained in a more simple manner.

5. Suppose two curves to be laid upon the same tangent line, and take *b* to denote the distance between their origins. Let one of those curves have a given modulus of curvature denoted by *T*, and let it pass through a given point at the extremity of the *n*th chain. It is then proposed to find the modulus of curvature of the other curve such that it may also pass through the same given point.

The co-ordinates of the given point, taken with reference to the origin of the required curve, will obviously be $x \pm b$, and *y*. Hence taking *T'* to denote the required modulus, it follows from the last article that, $\sin. T' =$

$$\frac{y}{x \pm b^2 + y^2}$$

Now substituting in this expression, for *x*, *y*, their values obtained in art. 2, and the necessary reductions being made, the following formula will be the result:

$$\sin. T' = \frac{1 - \cos. 2nT}{\sin. T} \pm 2b \sin. 2nT + 2b^2 \sin. T$$

This theorem will be found to be quite convenient in the field to answer several different purposes, when the curves are too long to be within the limits of the more simple approximative methods. With regard to the double sign, it must be observed, that the negative value obtains, when the origin of the curve sought is in advance of the origin of the given curve; and the positive value must be taken in the contrary case.

6. If the point designated for the required curve to meet does not coincide with the extremity of the *n*th chain of the given curve, as in art. 5 it is supposed, but varies a small distance to the right or left; yet, if the curves are long, the best method will always be to compute the value of *T'*, as though the required curve were intended to pass through the point considered in that article; and then the requisite small variation in the computed value of *T'*, to meet the case proposed, may be subsequently calculated by very simple approximative methods.

7. Suppose two given curves to be laid upon the same tangent line, and let *b* denote the distance between their origins. Take *T* and *T'* to represent the given moduli of curvatures; and *n* and *m* the number of chains contained in each curve respectively. It is proposed to determine the distance between the extreme stations of those two curves, and the inclination of the two tangents at those two extremities.

I will here take *T* to denote the modulus of curvature of that curve which is most in advance upon the tangent line, with respect to the directions in which the curves are laid from their origins. Let *x*, *y*, and *x'*, *y'*, be the respective co-ordinates of the two extreme stations, each originating at the origin of its respective curve. The difference of co-ordinates, when referred to any common origin on the tangent line, will then be $x + b - x'$, and $y - y'$. Hence, taking *w* to denote the distance sought, the common principle of analytical geometry gives the following expression:

$$w = \{x + b - x'\}^2 + \{y - y'\}^2$$

And from this equation the required distance becomes known; for, by art. 2,

$$\left. \begin{aligned} x &= \frac{\sin. 2nT}{2 \sin. T} \\ y &= \frac{1 - \cos. 2nT}{2 \sin. T} \end{aligned} \right\} \quad \left. \begin{aligned} x' &= \frac{\sin. 2mT'}{2 \sin. T'} \\ y' &= \frac{1 - \cos. 2mT'}{2 \sin. T'} \end{aligned} \right\}$$

The inclination of each tangent to the common tangent at the origins is $2nT$ and $2mT'$ respectively, and $2nT - 2mT'$ will consequently express the required inclination of the two tangents to each other. These two tangents will converge when $2mT'$ is less than $2nT$, and the determination of their point of intersection will be easily effected by the preceding principles.

8. When the two moduli of curvatures *T* and *T'* are equal, the problem considered in the last article becomes much more simple. For the value of *w* being developed, and the values of *x*, *y*, and *x'*, *y'*, substituted for them, and the necessary reductions being made agreeably to the known principles of analytical trigonometry, the following formula is the result:

$$w = \left\{ \frac{1 - \cos. \{2nT - 2mT'\}}{1 - \cos. 2T} + b \times \frac{\sin. 2nT - \sin. 2mT'}{\sin. T} + b^2 \right\} \frac{1}{2}$$

This expression will be useful for a variety of purposes in the field.

9. The formulas which have been investigated in the 8 preceding articles are all *rigorously accurate*; and when long curves are under consideration, which embrace portions of circumferences containing more than 20° or 30° , these formulas will find their application; for in such cases, none of the *usual methods* of approximation are applicable.

The above very brief view of this subject will be only sufficient to illustrate the general fact, that all the necessary formulas are easily made to flow from the two principal formulas given in art. 2. Very useful approximative rules may also be easily derived from those already given; but I cannot continue this inquiry. The subject may perhaps be resumed in some future number of this Journal.

VAN DE GRAAFF.

Lexington, Ky., February, 1834.

The Undulating Railway. [From the London Mechanics' Magazine.]

SIR,—To prevent the possibility of any further misunderstanding in reference to the experiments recently made on the Liverpool and Manchester railway, I have this morning called upon Mr. Booth, and have compared with his statement thereof the following particulars of the rise of the Sutton inclined plane, from its base to a higher point of elevation than any which was attained in our experiments. To render this explanation more clear, on which reliance may be placed, I have accompanied it by a diagram, wherein is denoted the points from which the ascents and descents, during the experiments, were measured.

I am extremely sorry that these particulars have not before been published, as the want of them has evidently produced inconvenience to some of your correspondents, which, had it occurred to me, I ought not to have permitted.

The ascent of the Sutton inclined plane may be said (see diagram) to commence at the point a; although for a distance of 2½ miles before arriving at that point there is a trifling ascent of about 1 in 2,640—viz. from the Sankey viaduct to the foot of the plane.

Now, the series of experiments first published (see No. 531), and which were tried with the Rocket engine, were made from what was considered the foot of the plane, and which in the diagram is marked letter b.

The results of those experiments evidently proved to me that the inclination of that part of the plane on which they were tried was not, as generally supposed, 1 in 96. I perfectly recollect Mr. Sanderson alluding to some supposed error, though why the allusion was "not palatable to me" is a perfect mystery. It was not, however, until after I sent you the particulars of the experiments, and my return to Douglas, that I had an opportunity of making such calculations as led me to call a second time on Mr. Booth, viz. before the trial of the second series of experiments, and explain to him the discrepancy which appeared. For instance, see page 21, experiment 6:—The Rocket engine and a load of 35 tons ascended by momentum 134 yards; the velocity at the foot of the plane being 10 miles per hour, which ascent was equal to 4.1875 feet perpendicular elevation. Now, 10 miles per hour is 14.672 feet per second, and supposing friction out of the question, a body having gained a momentum of 14.672 feet per second, by gravity, would only ascend 3.36355 feet. Thus it was evident to me that 1 in 96 was not the proper inclination of that part of the plane. Previously, however, to the experiments afterwards detailed, the levels were taken afresh by the Messrs. Dixon,* and in the experiments tried with the Liver and load on the 16th (see No. 534,) the ascents were measured from that part of the plane marked x in the diagram, at which point there is a cottage on the railway. On the Sunday following it was agreed by the engineers present that the place of starting should be again changed, and the experiments with the double load were all made from that part of the plane from which the Rocket had ascended, viz. from b. It will naturally occur to your readers—if Mr. Badnall were acquainted with all these particulars, why did he not lay them before the public? The fact is, that I considered the result of the experiments made with the Pluto and Firefly, with the double load, such as to render all explanation unnecessary with regard to the previous trials, and especially as I stated at page 71, that the inclination upon which those latter experiments were tried was about 1 in 99, which will be found to be the average. Moreover, I did not at the time consider a knowledge of the exact inclination of the plane at all necessary to a clear comprehension of the nature and results of the experiments, inasmuch as all I wished to prove was, that whether velocity was generated by one or more engines at the foot of ascent, by which velocity

(either with or without the continued assistance of one engine) a given elevation was surmounted, a greater velocity could be generated by descending the same distance, evidently proving, beyond all rational doubt, the correctness and value of the principle.

The discrepancy alluded to by "Kinclaven" will be explained, I trust, satisfactorily to him, by referring to the statement of the experiment to which he alludes. In that instance the word momentum is not introduced; on the contrary, the whole power of the Liver engine was employed throughout the whole ascent. Had this not been the case, there evidently must have been some great error. I need not say that I shall be most happy, not only to give every further information in my power, but if any of my opponents will propose any further practical test, upon the result of which they will cast the merits of the question, it shall be, if possible, immediately and most impartially tried.

As a proof of the impartiality with which I have recorded the experiments already tried, I refer to all the engineers present, whether the steam of the Pluto (see last experiment) was not shut off 155 yards before she arrived at the starting post, which made a very considerable difference in the rise by momentum. Seeing, however, that I had proved enough, I neither complained at the time, nor have I hitherto published my complaint. The error arose from the two conductors of the engines shutting off the steam of both engines when the flag dropped for the first engine to shut off on passing the mark, letter b.

May I again ask if Mr. Cheverton and "S. Y." will be satisfied that there is an advantage if a given locomotive engine will move, at a given velocity, double the load from summit to summit which she is capable of moving on the level at the same velocity? If so, will they, if not satisfied with the impartial judgment of our northern engineers, attend on an appointed day, of which they shall have due notice, and witness the experiments themselves? If they refuse to attend, and if they disbelieve the results of the experiments already tried, it is needless to make a single further comment on their opposition. On the other hand, if they do attend, and if they do witness a decided proof that a load, which will not move on a level, will move from summit to summit of an undulation at a great velocity, what becomes of the "ASSUREDLY NOT" of the Champion—and why is it necessary that "S. Y." should give such friendly advice to Mr. Ham. and to the subscribers of the great western railway? I am, however, happy in believing, that a full and impartial trial of the undulating principle will soon be made on rather an extensive scale; and I hope "S. Y." will state his practical objections, and that the Champion's rod may be most freely exercised before such trial takes place. As to the sickness which these gentlemen complain of, I am sorry I can administer no better restorative than my regret.

I am, sir, with great respect,

RICHARD BADNALL.

Manchester, November 28, 1833.

P. S.—I observe that "S. Y." makes some allusion to "The Editor of the Manchester Guardian." Probably he is not aware that Mr.

Garnett, the editor, is an opponent of mine, and one for whose mechanical attainments I have a very high opinion.

Improved Method of Packing Pistons. By T. B. S. To the Editor of the Mechanics' Magazine.

Knowing that many of your readers take a lively interest in whatever contributes to the perfection of the means by which the mighty energies of steam are directed in channels of usefulness, I submit a brief description of an improvement in a minute though an important part of the steam engine. Many expedients have been devised to avoid the use of hemp for the packing of the piston; various metallic substances have been substituted, and numberless other materials long since condemned after repeated trials.

While the piston as adopted by the ingenious Mr. Watt continues in almost universal use, and until a cheap and more enduring piston is discovered, it will doubtless continue to be the favorite plan. In one of its features, however, I consider it susceptible of improvement.

Heretofore engineers have considered it important to form the projecting parts of the piston and follower so as to crowd the hemp outward against the cylinder, as the follower is screwed down to its place. The sketch, fig. 1, is about the form usually given to the

Fig. 1.

Fig. 2.

metallic part of the piston, and shows the form of the recess for the reception of the packing. It is apparent that the obtuseness of the corners at a, a, a, a, are well calculated to avoid the packing as it becomes chafed by friction against the cylinder, while the general shape of the recess greatly conduces to an excessive friction near those angles. Fig. 2 represents the improved form of the piston as I have applied it in several instances, and with success. The acuteness of the edges, a, a, a, a, is calculated to preserve the packing from chafing, to hold it in a body to its place, and will retain it, even though worn to fragments, or otherwise reduced, as it may be liable from a variety of causes. Most of the engines in use have pistons of the former description, and the experiment may be tried with a trifling expense, simply by turning a cavity as near to the form of that in fig. 2 as the substance of the piston will allow.

In the hope that some may derive a benefit from the suggestions, as well as to contribute a mite to the interest of your valuable periodical, I offer them.

I am, yours, &c.

T. B. S.

New-York, Jan. 24, 1834.

* I had also an opportunity of comparing, this morning, my notes on the rise of the inclined plane with Mr. Dixon's, sen., from whom I had originally been favored; with them.

OF COMETS.

Of all celestial bodies, comets have given rise to the greatest number of speculations. In the ages of ignorance and superstition, they were believed to be the harbingers of divine vengeance, and to portend great political and physical convulsions. The most ancient opinion respecting their nature was, that they were enormous meteors formed in the earth's atmosphere. Yet many of the ancients entertained opinions respecting them agreeing with some parts of the *modern* hypothesis respecting these bodies; for they believed that they were so far of the nature of planets, that they had their periodical times of appearing, and that when they were out of sight they were carried aloft to an immense distance from the earth, but again became visible when they descended into the lower regions of the air, when they were nearer to us. Modern astronomers are now generally agreed, that they have no light of their own, and appear luminous only by the light of the sun. They have no visible disc, and shine with a pale whitish light, accompanied with long transparent trains, or tails, proceeding from that side which is turned away from the sun. When a comet is viewed through a good telescope, it appears like a mass of vapors surrounding a dark nucleus of different degrees of opacity in different comets. As these bodies approach the sun their light becomes more brilliant, and after they reach their perihelion, often exceed any of the planets in lustre. Their tails are also observed to increase, both in length and brightness, as they approach the sun. The opinions of astronomers respecting these tails have been very different. Tycho Brahe, who was the first that gave the comets their true rank in the creation, supposed that the tail was occasioned by the rays of the sun passing through the nucleus of the comet, which he believed to be transparent. Kepler thought that it was the atmosphere of the comet which was driven behind it by the force of the solar rays. Sir Isaac Newton maintained that the tail was a thin vapor, ascending by means of the sun's heat, as smoke does from the earth. Euler supposes that the tail is produced by the impulse of the solar rays driving off the atmosphere from the comet. Dr Hamilton, of Dublin, supposes them to be streams of electric matter.

In any of these opinions there is little to entitle it to preference above the others; and till multiplied observations shall have added to the imperfect knowledge which we at present possess of these bodies, it is perhaps better not to give a decided preference to any of them.

From a number of observations made by Sir Isaac Newton on the comet that appeared in the year 1680, he was enabled to discover the true motion of these bodies.

Dr. Halley, following the theory of Newton, set himself to collect all the observations which had been made on comets, and calculated the elements of 24 of them. By computations founded on these elements, he concluded that the comet of 1682 was the same that had appeared in the years 1456, 1531, and 1607; that it had a period of 75 or 76 years; and he ventured to predict, that it would appear again about the year 1758, which it actually did; therefore it may be expected to appear again in the year 1835.

When a comet makes its appearance, it is only for a very short period, seldom ex-

ceeding a few months, and sometimes only a few weeks. Instead of moving from *west* to *east*, like the planets in orbits making small angles with the ecliptic, they are observed to cross it at all angles. Their progress among the fixed stars is in general more rapid than that of the planets, and their change of apparent magnitude is much more remarkable. When a comet retires from the sun, its tail decreases and nearly resumes its first appearance. Those comets which never approach very near the sun have nothing but a coma or nebulosity round them during the whole time of their continuance in view.

The tail of a comet is always transparent, for the stars are often distinctly visible through it, and it has even been said, that on some occasions they have been seen through the nucleus or head. The length and form of the tail are very different. Sometimes it extends only a few degrees, at others it extends more than 90 degrees. In the great comet that appeared in the year 1680, the tail subtended an angle of 70°, and the tail of the one which appeared in 1618, an angle of 104°. The tail sometimes consists of diverging streams of light: that of the comet which appeared in the year 1744 consisted of six, all proceeding from the head, and all a little bent in the same direction. The tail of the beautiful comet which appeared in 1811 was composed of two diverging beams of faint light, slightly colored, which made an angle of 15° to 20°, and sometimes much more. Both of them were a little bent outward, and the space between them was comparatively obscure.

The apparent difference in the length and lustre of the tail of comets has given rise to a popular division of these singular bodies into three kinds, namely, *bearded*, *tailed*, and *hairy* comets; but this division rather relates to the several circumstances of the *same* comet, than to the phenomena of different ones. Thus when the comet is *east* of the sun, and moves *from* him, it is said to be *bearded*, because the light precedes it in the manner of a beard; when the comet is *west* of the sun, and sets after him, it is said to be *tailed*, because the train of light follows it in the manner of a tail; and when the sun and comet are diametrically opposite, the earth being between them, the train or tail is all hid behind the body of the comet, except the extremities, which being broader than the body of the comet, appear to surround it like a border of *hair*, and on this account it is called *hairy*. But there have been several comets observed, whose discs were as clear, round, and well defined, as that of Jupiter, without either tail, beard, or coma.

The magnitude of comets has been observed to be very different; many of them without their *coma* have appeared no larger than stars of the first magnitude; but some authors have given us accounts of others which appeared much greater: such was the one that appeared in the time of the emperor Nero, which, as Seneca relates, was not inferior, in apparent magnitude, to the sun himself. The comet which Hevelius observed in the year 1652 did not seem to be less than the moon, though it was deficient in splendor, for it had a pale, dim light, and appeared with a dismal aspect. Most comets have dense and dark atmospheres surrounding their bodies, which weaken the

sun's rays that fall upon them; but within these appears the nucleus or solid body of the comet, which, when the sky is clear, will often give a more splendid light.

Respecting the nature of these singular and extraordinary bodies, philosophers and astronomers in all ages and countries have been very much divided in their opinions. The vulgar have, however, invariably considered them as *evil omens*, and forerunners of war, pestilence, famine, &c.; and to adopt the language of an old poet,

"The blazing star was viewed—
Threat'ning the world with famine, plague, and war;
To princes death; to kingdoms many cruises;
To all estates inevitable losses;
To herdsmen rot; to ploughmen hapless seasons;
To sailors storms; to cities civil treasons."

The Chaldeans, who were eminent for their astronomical researches, were of opinion that comets were lasting bodies, which had stated revolutions as well as the planets, but in orbits considerably more extensive, on which account they are only visible while near the earth, but disappear again when they ascend into the higher regions. Pythagoras taught that comets were wandering stars, disappearing in the superior parts of their orbits, and becoming visible only in the lower parts of them. Some of the ancient philosophers supposed they were nothing else but a reflection of the beams from the sun or moon, and generated as a rainbow; others supposed they arose from vapors and exhalations. The illustrious Aristotle was of opinion they were meteors. Modern philosophers have been equally perplexed as their predecessors in accounting for the nature of these magnificent celestial appearances.

The eccentric but learned Paracelsus gravely affirmed that they were formed and composed by angels and spirits, to foretel some good or bad events. Kepler, the celebrated astronomer, asserted that comets were monsters, and generated in the celestial spaces by an animal faculty! The sentiments of Bodin, a learned French writer of the 16th century, were yet more absurd; for he maintained that comets are spirits which have lived upon the earth innumerable ages, and being at last arrived on the confines of death, celebrate their last triumph, or are called to the firmament like shining stars!

James Bernoulli, a celebrated Swiss philosopher, formed a rational conjecture relative to comets, in viewing them as the satellites of some very distant planets invisible on the earth on account of its distance, as were also the satellites, unless when in a certain part of their course. Tycho Brahe, the illustrious but unfortunate philosopher of Denmark, supported a true hypothesis on this subject. He averred that a comet had no sensible diurnal parallax, and therefore was not only far above the regions of our atmosphere, but much higher than the moon; that few have come so near the earth as to have any diurnal parallax, yet all comets have an annual parallax; the revolution of the earth in its orbit causes their apparent motion to be very different from what it would be if viewed from the sun, which demonstrates that they are much nearer than the fixed stars, which have no such parallax.

Descartes advanced another opinion, which is, that comets are only stars that were formerly fixed like the rest, but becoming gradually covered with *maculae* or spots, and at length wholly deprived of their light, cannot

keep their places, but are carried off by the vortices* of the circumjacent stars; and in proportion to the magnitude and solidity, moved in such a manner as to be brought nearer to the orb of Saturn; and thus coming within reach of the sun's light, are rendered visible.

The number of comets belonging to the solar system is said not to be less than 450; but the periods of not more than three of these are known. The velocity of these bodies, and their distance from the sun, when in the remotest part of their orbits, exceed all human comprehension. Sir Isaac Newton calculated the velocity of the comet of 1680, and found it to be 880,000 miles per hour, and its aphelion distance not less than 11,200,000,000 miles.

Respecting the use of these bodies, many conjectures have been formed. Mr. Whiston thought it probable that they were appointed by the Almighty as places of punishment for sinners after death, who would be alternately tormented with the most insupportable heat when nearest the sun, and in the opposite point with the greatest possible cold.

Sir Isaac Newton, amongst other purposes which he thinks they may be designed to serve, adds, "that for the conservation of the water and moisture of the planets, comets seem absolutely requisite, from whose condensed vapors and exhalations all the moisture which is spent in vegetation, and turned into dry earth, &c. may be supplied and recruited, for all vegetables grow and increase wholly from fluids; and again, as to their greatest part, by putrefaction into earth. Hence the quantity of dry earth must continually increase, and the moisture decrease, and be quite evaporated, if it did not receive a continual supply from some part or other of the universe;"—and I suspect," adds this philosopher, "that the *spirit*, which makes the finest, subtlest and best part of our air, and which is absolutely requisite for the life and being of all things, comes from the comets."

* Descartes supposed that every thing in the universe was formed from very minute bodies called *atoms*, which had been floating in open space. To each atom he attributed a motion on its axis; and he also maintained, that there was a general motion of the whole universe round like a vortex, or whirlpool. In the centre of this vortex was the sun, with all the planets circulating round him at different distances; and that each star was also the centre of a general vortex round which its planets turned. Besides these general vortices, each planet had a vortex of its own, by which its satellites (if it had any) were whirled round, and any other body that came within its reach.

FRIENDSHIP.—"When fortune smiles, and life is prosperous and fair, then it is that the nominal and true friend may seem alike sincere." Then it is that small and great, rich and poor, bond and free, bow at your shrine and prostrate themselves as it were at your feet. But when unfortunately the dark clouds of sorrow and disappointment gather thick around you, and you find yourself beset with troubles, losses, crosses, and disappointments, on every side, then you are ready to exclaim, "Fortune can create friends, but adversity alone can try them." Your friends of fortune will desert you. They will laugh at your misfortunes, and heap upon you shame and disgrace. They will sink you, if possible, lower, in point of honor and reputation, and in all your attempts to rise, cross and blight you at every turn.

But not so with the true friend. Though all your earthly prospects are cut off, he will

not desert you, but if possible administer to your relief. Let us, therefore, cultivate and cherish that friendship, and that alone which will not diminish, though sorrows oppress and afflictions invade us: that too which will cheer and animate us amid our darkest hours and shine brightest in affliction's night.—[Monthly Repository.]

MANKIND MUTUALLY DEPENDANT.

Not only the correct and excellent sentiments, and the accomplished expression of the following communication, but the source from which it emanated, give it a value for our paper. It is one among numerous compositions furnished by the Ladies' Composition Class of the Boston Wesleyan Lyceum. This piece, like many others which have been prepared by this class, does credit to the intellect and still more to the heart of the author. The sentiment and spirit manifested are those of christian kindness; and if believed and practised by the whole human family, would light up our depraved and forlorn world with the brightness of pure felicity. Who is not ready to try the experiment?

The cold-hearted stoic may boastingly accede to the sentiment, that 'man is sufficient for himself;' but the philanthropist rejoices in the beautiful system of mutual dependance which unites him so closely with the whole human family. He views with pleasure the facilities which the genius of men has supplied for communication with other lands; for contributing to the necessities, convenience and ease of each other, by exchanging the products of different climes; he considers all men as the children of one Parent, improving the advantages with which they are favored, for the benefit of themselves and of their brethren.

Not only do these pleasurable feelings arise in the breast of him whose heart is deeply imbued with love for the whole human race, but a little reflection will excite them in the mind of one whose views are more selfish and contracted; and constrain him to acknowledge the wisdom of a system for the division of labor, and for the promotion of friendly intercourse, which mankind, as it were by mutual consent, have so universally adopted.

Every vocation in life depends on many others for its support. The agriculturists of New-England, said to be the most independent class of people, may be adduced as examples in favor of this assertion; the toils of the blacksmith, the carpenter, &c. are all put in requisition to enable them to cultivate the soil to advantage.

The rich are dependant on the poorer classes, and the poorer classes on the wealthy: without the former, commerce and manufactures would languish—and deprived of the latter, the fatigues of manual labor would be added to those mental vexations from which the affluent are seldom exempt.

The young look to their superiors in years for counsel and instruction, and the aged to the vigor of youth and manhood for support.

A mutual dependance exists between the inhabitants of one clime and those of another; the wealth of one nation is comprised in its mines of silver and gold, that of another in the products of its soil. Those who depend on the latter may be considered as peculiarly favored; for where the former exist, those arts which constitute the happiness and prosperity of a people are almost invariably neglected. From this circumstance, indolent habits, both of body and mind, are induced, and these in their turn generate many vices.

To the conquests of the Spanish in America, may be attributed the low state of morals, literature, and science, which prevails among them; for finding that they had ac-

quired, with an extensive territory, a resource for the supply of all their wants, the natural advantages of their natal land were disregarded.

The advantages occurring from this system of mutual dependance are many; the division of labor, or the devotion of every man's talent to some particular trade or profession, is an economy, not only of time, but of health and of money.

Should one man engage in the pursuits which are now apportioned among many, much time would be lost in the acquisition of knowledge in various branches; his health would be impaired from the attention bestowed on them; his gain would not be in ratio to the expenses incurred; and no opportunity would be afforded of attaining to perfection in any.

From the consideration that we are continually reciprocating favors with our fellow beings, and that there are none so humble as not to be able to render us assistance in one way or another, we should be excited to kindness and humility; under the influence of so beneficent a system, the asperities of life should lose their keenness, and all the social feelings of our nature be expanded. M. O.

MECHANICS' WIVES.—Speaking of the middle ranks of life, a good writer observes:

"There we behold woman in all her glory: not a doll to carry silks and jewels, not a poppet to be flattered by profane adoration, revered to-day, discarded to-morrow; always jostled out of the place which nature and society would assign her, by sensuality or by contempt; admired, but not respected; desired, but not esteemed; ruling by passion, not affection; imparting her weakness, not her constancy, to the sex she would exalt; the source and mirror of vanity. We see her as a wife partaking the cares and cheering the anxiety of a husband, dividing his toils by her domestic diligence, spreading cheerfulness around her; for his sake sharing the decent refinements of the world, without being vain of them; placing all her joys and her happiness in the man she loves. As a mother, we find her the affectionate, the ardent instructress of the children whom she has tended from their infancy; training them up to thought and virtue, to piety and benevolence; addressing them as rational beings; and preparing them to become men and women in turn. Mechanics' daughters make the best wives in the world."

RIDING.—On which side of the lady, on horseback, should the gentleman ride?

The translator of the Principles of the Art of Modern Horsemanship says: "When a gentleman accompanies a lady on horseback, he should take the left side of her horse. The custom of taking the right side is derived from the English mode of riding. The law of England directs the left hand to be taken; the gentleman therefore takes the right, to protect the lady from vehicles, &c. which pass on her left. Here the law directs the right hand of the road to be taken, consequently the gentleman should take the left side of the lady's horse. It seems to be best adapted to afford efficient assistance, whatever may occur. The right hand of the gentleman is perfectly free, and may be used either to stop the horse or rescue the lady from danger. He can on this side aid her in disentangling her dress, disengaging her foot from the stirrup, adjusting her reins, and lifting her off her seat, without exposing her to the accidents which might occur to him if he attempted to give her assistance from the other side. It is not so easy to afford assistance to the lady with the left hand, nor is it so easy for the rider to command his own horse with the right hand."

THE CHASSEUR ANTS OF TRINIDAD.—One morning my attention was arrested at Laurel Hill by an unusual number of black birds, whose appearance was foreign to me; they were smaller but not unlike an English crow, and were perched on a calabash tree near the kitchen. I asked the house negress, who at that moment came up from the garden, what could be the cause of the appearance of those black birds? She said, "Misses, dem a sign of the blessing of God; dey are not the blessing, but only de sign, as we say, of God's blessing. Misses, you will see afore noon-time how the ants will come and clear the houses." At this moment I was called to breakfast, and thinking it was some superstitious idea of hers, I paid no further attention to it.

In about two hours after this, I observed an uncommon number of *chasseur ants* crawling about the floor of the room: my children were annoyed by them, and seated themselves on a table, where their legs did not communicate with the floor. The ants did not crawl upon my person, but I was now surrounded by them. Shortly after this the walls of the room became covered by them; and next they began to take possession of the tables and chairs. I now thought it necessary to take refuge in an adjoining room, separated only by a few ascending steps from the one we occupied, and this was not accomplished without great care and generalship, for had we trodden upon one, we should have been summarily punished. There were several ants on the steps of the stair, but they were not nearly so numerous as in the room we had left; but the upper room presented a singular spectacle, for not only were the floor and the walls covered like the other room, but the roof was covered also.

The open rafters of a West India house at all times afford shelter to a numerous tribe of insects, more particularly the cockroach, but now their destruction was inevitable. The *chasseur ants*, as if trained for battle, ascended in regular thick files, to the rafters, and threw down the cockroaches to their comrades on the floor, who as regularly marched off with the dead bodies of cockroaches, dragging them away by their united efforts with amazing rapidity. Either the cockroaches were stung to death on the rafters, or else the fall killed them. The ants never stopped to devour their prey, but conveyed it to their storehouses.

The windward windows of the room were of glass, and a battle now ensued between the ants and the *jack-spaniards* on the panes of glass. The *jack-spaniards* may be called the wasp of the West Indies; it is twice as large as the British wasp, and its sting is in proportion more painful. It builds its nest in trees and old houses, and sometimes in the rafters of a room. These *jack-spaniards* were not quite such easy prey as the cockroaches had been, for they used their wings, which not one cockroach had attempted to do. Two *jack-spaniards*, hotly pursued on the window, alighted on the dress of one of my children. I entreated her to sit still, and remain quiet. In an inconceivably short space of time, a party of ants crawled upon her frock, surrounded and covered the two *jack-spaniards*, and crawled down again to the floor, dragging off their prey, and doing the child no harm. From this room we went to the adjoining bedchamber and dressing-room, and found them equally in possession of the *chasseurs*. I opened a large military chest full of linens, which had been much infested; for I was determined to take every advantage of such able hunters. I found the ants already in possession of the inside: I suppose they must have got in at some opening at the hinges. I pulled out the linens on the floor, and with them hundreds of cockroaches, not one of which escaped.

We now left the house and went to the chambers built at a little distance, but these were also in the same state. I next proceeded to open a store-room at the end of the other house for a place of retreat, but to get the key I had to return to the under room, where the battle

was now more hot than ever. The ants had commenced an attack on the *rats* and *mice*, which, strange as it may appear, were no match for their apparently insignificant foes. They surrounded them as they had the insect tribe, covered them over, and dragged them off with a celerity and union of strength that no one who has not watched such a scene can comprehend. I did not see one rat or mouse escape; and I am sure I saw a score carried off during a very short period. We next tried the kitchen, for the store-room and boys' pantry were already occupied, but the kitchen was equally the scene of battle between rats, mice, and cockroaches, and ants killing them. A huckster negro came up selling cakes, and seeing the uproar, and the family and servants standing out in the sun, he said, "Oh, Misses, you've got the blessing of God to-day, and a great blessing it is to get such a cleaning."

I think it was about ten when I first observed the ants; about twelve the battle was formidable; soon after one the great strife began be-

tween the rats and the mice; and in about three the houses were cleared. In a quarter of an hour more the ants began to decamp, and soon not one was to be seen within doors. But the grass around the house was full of them; and they seemed now feeding on the remnants of their prey, which had been left on the road to their nests; and so the feasting continued till about four o'clock, when the black birds, who had never been long absent from the *calibash* and *pois doux* trees in the neighborhood, darted down among them, and destroyed by millions those who were too sluggish to make good their retreat. By five o'clock the whole was over: before sundown, the negro houses were all cleared in the same way; and they told me that they had seen the black birds hovering about the almond trees close to the negro houses as early as seven in the morning. I never saw the black birds before or since, and the negroes assured me that they were never seen but at such times.—[Mrs. Carmichael on the West Indies.]

A Bow Rudder. By W. ALDERSEY. [From the United Service Journal.]

The following plan is proposed for fixing and working a rudder at the bow of a vessel, to act in unison with the rudder at the stern, as calculated to embrace all the advantages proposed by that experienced and highly respectable officer in the East India Company's service, Capt. William Manning, as stated in p. 541 of the United Service Journal for December, 1831; and which, I think, will also be found to meet the objections of W. J. T. of Cambridge, page 260, in the number for October, 1832.

The plan consists in fixing an additional stem, made of iron, of sufficient strength, on the present stem of the vessel (already built), and securing the same by strong braces fixed securely on the bow, and hanging the rudder on the additional stem at the bow, precisely in the same way as the rudder at the stern is hung, as shown in the drawing.

The following results may be expected: 1st, The rudder at the stem is intended to act in unison with the rudder at the stern, by which means the same force would be exerted at each end of the vessel, and would unite in effect to bring the vessel round to the wind, and prevent her missing stays; 2d, When before the wind, or nearly so, the rudder on the stem might be allowed to swing, or be fixed, as thought necessary; 3d, When the tiller at the stem is put a little to leeward, and the rudder at the stern is made to act in unison with it, their combined influence would very much tend to keep the vessel to windward; 4th, The rudder at the stem would be an additional security in case of accident to the rudder at the stern, to which it is liable from going over a bar, and from other causes; 5th, The additional rudder at the stem appears particularly suitable for steam vessels, by which means the steersman at the bow would have it in his power to discover, and instantly avoid, every impediment in the ship's course; and would be particularly useful at night, and in foggy and boisterous weather, and in rivers crowded with vessels, both moving and stationary.

In the drawing, the keel is lengthened to

the extremity of the foot of the rudder, to show an easy and safe mode of protecting it from accident, when the ship touches the ground at the stern. In building a new vessel, the keel may be carried out, in the first instance, of sufficient length to have the additional stem built in the frame of the vessel to receive the bow rudder; and the tiller may be made in any form, and applied in any way, most convenient.

POPULAR ERRORS IN MEDICINE.—[By an Edinburgh Physician.]—A very common practice in eating such fruit as cherries is to swallow the stones, with the vague notion that these promote digestion. No error can be more fatally absurd. Many cases have occurred where such practices have been the cause of death, and that of a very excruciating nature. One instance is on record of a lady who died in great agony after years of suffering, and the cause was found to be several large balls lodged in the intestines, accumulated around clusters of cherry stones. The husks of gooseberries are often swallowed with the idea that they prevent any bad effects from the fruit. On the contrary, they are the most indigestible substance that can be swallowed, and pass the stomach without any change, although they cause excessive irritation, and not unfrequently inflammation in the bowels.

Many people put great faith in the wholesomeness of eating only of one dish at dinner. They suppose that the mixture of substances prevents easy digestion. They would not eat fish and flesh, fowl and beef, animal food and vegetable. This seems a plausible notion, but daily practice shows its utter absurdity. What dinner sits easier on the stomach than a slice of roast or boiled mutton, and carrots or turnips, and the indispensable potato? What man ever felt the worse of a cut of cod or turbot followed by a beef-steak, or a slice of roast beef and pudding? In short, a variety of wholesome food does not seem incompatible at meals, if one do not eat too much—here the error lies.

It is a practice with bathers, after having walked on a hot day to the sea-side, to sit on the cold rocks till they cool before going into the water. This is quite erroneous. Never go into the water if over-fatigued, and after profuse and long-continued perspiration, but always prefer plunging in while warm, strong and vigorous, and even with the first drops of perspiration on your brow. There is no fear

of sudden transitions from heat to cold being fatal. Many nations run from the hot bath and plunge naked into the snow. What is to be feared is sudden cold after exhaustion of the body, and while the animal powers are not sufficient to produce a reaction or recovery of the animal heat.

There is a favorite fancy of rendering infants and farther advanced children hardy and strong by plunging them into cold water. This will certainly not prevent strong infants from growing stronger, but it will, and often does, kill three children out of every five. Infants always thrive best with moderate warmth and a milk-warm bath. The same rule applies to the clothing of infants and children. No child should have so slight clothing as to make it feel the effects of cold—warm materials, loose and wide-made clothing, and exercise, are all indispensable for the health of little ones. But above all things, their heads should be kept cool, and generally uncovered.

Many people so laud early rising as would lead one to suppose that sleep was one of those lazy, sluggish, and bad practices, that the sooner the custom was abolished the better. Sleep is as necessary to man as food, and as some do with one-third of the food that others absolutely require, so five hours' sleep is amply sufficient for one, while another requires seven or eight hours. Some men cannot by any possibility sleep more than four or five hours in the twenty-four; and, therefore, true to the inherent selfishness of human nature, they abuse all who sleep longer. No man should be taunted for sleeping eight hours if he can.

Many people do not eat salt with their food, and the fair sex have a notion that this substance darkens the complexion. Salt seems essential for the health of every human being, more especially in moist climates such as ours. Without salt, the body becomes infected with intestinal worms. The case of a lady is mentioned in a medical journal, who had a natural antipathy to salt, and never used it with her food; the consequence was, she became dreadfully infected with these animals. A punishment existed in Holland, by which criminals were denied the use of salt; the same consequence followed with these wretched beings. We rather think a prejudice exists with some, of giving little or no salt to children. No practice can be more ridiculous.

AGRICULTURE, &c.

C. H. McCormick's Self-Sharpening Horizontal Plough. [Communicated by the Inventor for the Mechanics' Magazine.]

Be it known, that I, Cyrus H. McCormick, of Rockbridge county, and State of Virginia, have made an improvement in the useful arts, being a "self-sharpening horizontal plough," which is described as follows:

This plough, like most others, consists of a beam, handles, helve, mould-board, and share. In addition to these there is a latch-rod to make fast the mould-board and share, when changed to either side, and a main bolt to support the mould-board.

The beam, handles, and helve, are similar to those employed in other ploughs. The mould-board, represented at *a* in the annexed drawings, is made double, of cast iron, curved somewhat like other mould-boards, on both sides. The wings, *b b*, are united in part at *c*, and extend outward, making a suitable angle for turning over the earth. There is a brace, *d*, extending between the two wings, behind, supporting them firmly with projections, *e e*, on one side, for receiving the latch-rod, *f*, when changing the plough. Between the wings on the top, and near the front, is a brace, *g*, and another, *h*, near the middle, through which there are openings for the main bolts, *i*, to pass. Near the bottom of the mould-board are two other braces, *k, l*, at about one inch apart, for receiving the hinder end of the share, and between which it plays and turns. Near the ends of these braces, and upon the lower side of the mould-board, are two projections, *m m*, upon which the mould-board slides alternately. These projections can either be cast solid, with the mould-board, or be made of steel or cast iron, and be rivetted on. These projections serve also to hold and support the share when turned. At the front end of the mould-board is cast on it a projection, *n*, which serves as a pivot, on which the share turns.

The share, *o*, is made of cast or wrought iron, in a triangular shape. It consists of the neck, *p*, (with or without a head,) and a slat, *g*, for a key, placed behind the braces; also, a point, *r*, either cast on the share or made separately, and fastened on it by being rivetted, or otherwise.

There is also a shoulder, or projection, *s*, by means of which and the latch-rod the share is kept in its place when changed. In the hinder end of the point is a cavity, *t*, to admit the point on the mould-board, upon which and the neck the share turns.

The main bolt, *i*, is made of wrought iron, and passes through the beam, and the two openings in the braces of the mould-board before mentioned having a head, *u*, on the lower end, and either a screw or key, *r*, on the head above the beam.

The latch-rod, *f*, is a plain curved rod of wrought iron, which extends from above the beam to the neck of the share, and is moveable from one side of the beam and mould-board to the other, passing between the beam and the projections on the brace of the mould-board, and entering between the neck of the share and the wing of the mould-board, and by which the mould-board and share are screwed in the position required.

OPERATION.—When required to plough on a hill-side, say the declination of the hill is on the right, the right wing of the mould-board and share must stand out from the beam

to the right, and the other wing of the mould-board being nearly parallel with the beam, forms the land-side, the latch-rod being put in its proper place. One furrow being made in this position, the latch-rod is taken out, and turning the plough, resting on the share, the share is turned on the point of the mould-board, to the other side, or left, and the mould-board also changes sides. The left wing projecting out to the left, the right wing forming the land-side, the latch-rod is passed between the other side of the beam and the other projection on the brace, the points entering again between the neck of the share and other wing of the mould-board, which pressing the shoulder on the share, above that on the mould-board, makes it fast. The neck of the share might be made to turn on a pivot or collar on the centre, instead of the opening between the braces. A nail or pin is driven in the helve, below the brace, to prevent the mould-board from sinking behind, or the beam from rising, to steady the plough.

The invention here claimed, and desired to be secured by letters patent, consists in the peculiar arrangement and construction of the several parts of the plough, as before described, and particularly the mode of forming the point at the end of the mould-board on which the share turns; and the two braces with the space between them, in which the neck of the share works; the brace near the centre of the mould-board; the two projections on which the mould-board slides; and the share, with the mode of turning and fastening it by the latch-rod.

Done at the city of Washington this 29th day of October, 1833.

CYRUS H. MCCORMICK.

HEDGING.—To ascertain in what way fields can be kept enclosed, with the least expense, is a matter of importance to every farmer in our country.

As a nation we are young in agriculture, and it is natural for us to refer back to those parts of the world from which our fathers emigrated for example, to aid us in our conclusions, on many subjects connected with our pursuits in life.

In order to form correct conclusions, in matters appertaining to agriculture, many things must be taken into consideration. The difference in the climate and soil of different countries is so great, that the course of cropping pursued in one country may be altogether improper for another; and plants which are found to succeed well in one climate on particular soils, may require different soils in other climates, or may not succeed at all on any soil.

Many experiments have already been made in this country, to establish the fact, whether, or not, hedges of any kind could be substituted for our stone and wood fences. Thus far the problem remains unsolved. Various experiments have been made with different plants, by different persons, and the results and reports have tended more to confuse than establish public opinion.

In looking abroad for examples, whereon to found our opinions, we naturally refer to England, Ireland, and France, as countries where agriculture as a science is better understood than in any other with which we have much intercourse.

In England and Ireland, hedges are more extensively cultivated, we believe, than in any other agricultural country. The soil and climate of England and Ireland may be counted very similar. The soil is of a rich secondary formation, and from their limited extent and being surrounded with water, the climate is temperate and humid. In summer the temperature rarely exceeds 75°, and during winter it seldom descends lower than 25° above zero, a variation not so great as has been known in this country within a few days.

From the scarcity of timber, and the consequent high price, methods are resorted to for enclosing their fields besides fencing with wood. Whenever stone can be procured at reasonable rates, they are preferred by farmers of every country to either wood fences or hedges.

Although from the peculiarities of the climate of England they have been successful in cultivating hedges, yet in France, where the temperature may be called temperate compared with ours, they did not find it for their interest to attend to their cultivation.

In England and Ireland the plant mostly cultivated for hedges is the quickset Haw-thorn, *Crataegus oxyacantha*, a native of Britain, and is admirably calculated for that purpose. In France, where the climate is more warm and dry, the Haw-thorn does not flourish well; insects injure it, and it becomes covered with moss, stunted, and dies.

In America, or in this section of the United States, our summers are much warmer than they are in France, and our winters more severe, and we have never seen a haw-thorn hedge with us that had that healthy appearance that they have in England, which we consider as proof positive that our climate is not as congenial to their growth as that of the country in which they are found growing spontaneously.

The first proposition to be solved by our farmers is in what manner can their fields be securely fenced for a length of time at the least expense. To answer this, all circumstances must enter into the calculation.

Allowing that it is thought advisable in any locality in our country to attempt the cultivation of hedges, then it becomes important to know what plants will succeed best in a given locality.

On inquiring into the natural location of plants, we find them in belts extending from east to west, across continents, varying from a direct line, according to the humidity and temperature of the atmosphere and the nature of the soil on which they grow.

With plants, as with animals, different species require different degrees of heat to insure health, added to which light and moisture have material influence.

On inquiring for plants suited to different locations, not only is the natural climate of the plant to be consulted, but the growth and habits of it are equally important.

The following is a list of those plants which have been recommended for hedging by different writers on the subject, together with a short description of their habits, and the country from which they have been brought or where they are found growing naturally.

THORN.—This is a common name applied to a numerous family, many of which have been used for hedging from time immemorial; as the limbs of the different kinds are more or less armed with sharp spines or thorns, they are well calculated for this purpose.

HAW-THORN—*Crataegus oxyacantha*.—This is the common hedge thorn of England. It is a native of Britain, where it grows to the height of fifteen or twenty feet, with many small limbs, which are armed with abundance of small sharp spines. It is found to be the best plant for hedging in England and Ireland that has ever been cultivated for that purpose.

EVER-GREEN THORN—*C. pyracantha*.—This is a native of the south of Europe, and has been cultivated for hedges, but is less valuable for that purpose than the preceding.

COCKSPUR THORN—*Scarlet flowering, Pear leaved, Yellow fruited*, and some others, are natives of America, are of larger growth than the hawthorn, and the limbs do not interlace as well. Most of the species of thorn are subject to be injured by insects during summer and field mice during the winter, in addition to which the stocks become in many localities covered with moss. We cannot recommend any of the above for hedges in this part of the state. They may be propagated from seed, which should be buried one year in the earth, after which they should be taken up and planted in rows as other seeds in the nursery.

HONEY LOCUST—*Gleditsia Triacanthus*.—This is a native North American tree, found growing in the forests of the middle states, where it often attains the height of sixty feet, with a trunk proportioned to its height.

This tree has been recommended for hedging, but it is found impossible to keep it in a dwarf state. The limbs are large and not suitable for interlacing. As it is a native of the southern and middle states, it does not well endure our northern winters when young.

PRICKLY ASH—*Zanthoxylum fraxineum*, and *tricarpum*.—Both these varieties are native American shrubs growing to the height of eight or ten feet, the limbs are armed with short thorns. These shrubs spread so much by sprouting from the roots that either of them would prove very troublesome when set for hedge.

BARBERRY or BERBERIS—*Berberis canadensis*.—This is an American shrub which infests many parts of the New-England states, growing to the height of six or eight feet, with upright stems, which are armed with slender sharp spines. Although we have long seen this shrub growing about fences, we do not recollect to have seen it treated as a hedge. From the strong prejudice there is against it, entertained by the New-England farmers, we think it would be difficult to induce them to cultivate it.

BUCK THORN—*Rhamnus catharticus*.—The English botanists claim this a native of Britain, and Professor Eaton says that it is found growing wild in New-England. From experiments made by E. H. Derby, Esq. of Massachusetts, it would appear that this is one of the most valuable plants for hedges in the northern states that has ever been tried. In this country it attains to the height of fifteen or twenty feet, the limbs are not long but thick, and are set with sharp spines. It endures the severity of our northern winters, and is not subject to be injured by insects. It is readily cultivated from seed, which are produced abundantly by old

trees. [See Report of the Massachusetts Society, with Mr. Derby's communication annexed, page 15 of Appendix to New-York Farmer, for March, 1834.]

OSAGE ORANGE—*Maclura aurantica*.—This is an American shrub, found on the banks of the Arkansas and some other southern streams. The foliage is of a deep green, somewhat resembling that of the orange, and the limbs are set with sharp thorns. It does not endure our northern winters.

APPLES.—Both the common and crab apples have been tried for hedges in this latitude, but neither have succeeded so as to bear recommendation for this purpose. Like thorns, they are liable to be destroyed by insects in summer and by mice in winter.

If there is any tree or shrub that we can recommend to farmers at this time for the purpose of substituting for wood and stone fences, with hopes of being more economical, it is the *White Italian Mulberry—*Morus alba**.

Professor Rafinesque, of Philadelphia, in speaking of different trees and shrubs with regard to their qualities for hedging, says, "I have left for the last this most valuable tree. It bears cutting, and is often raised in silk countries as a shrub and hedge, to collect the leaves easier. Grows with the utmost facility, lasting sixty years at least."

This tree, which is a native of China, appears perfectly naturalized in this country, or at least, coming from a country where the climate is not altogether different from our own, thrives well. It is easily cultivated, either from seed or cuttings. It grows to the height of thirty or forty feet, and somewhat resembles our common apple in shape and size.

As it appears well established now, that the raising of silk-worms and the making of silk in this country will be attended with a corresponding profit with other farming operations, there can be no danger in cultivating mulberry hedges, as it is allowed that it is the most profitable way to raise them when intended only for worms, and if they will answer the double purpose of feeding silk-worms and as a substitute for fences, the inducements to raise them must be very great.

When it is designed to raise plants from seed, they should be sown in the fore part of May, and one ounce of seed is thought to be sufficient for raising from eight to ten thousand trees.—[Goodsell's Genesee Farmer.]

CULTIVATION OF NATIVE GRAPE.—N. Longworth, Esq. has experimented extensively in the culture of American grapes. His opinions are, therefore, entitled to attention. We give an extract from an address recently delivered:

"I have found no foreign grape that will pay the expense of open culture in our climate. Native vines, planted on ground with no other preparation than deep ploughing, have thus far succeeded better than those on steep side-hills, where the ground was prepared with great expense. Those parts of my vineyards fully exposed to the north have often ripened their fruit better than those with a southern exposure. Some of the finest wines of France are made in a northern latitude, and on hills fully exposed to the north.

"Others are deterred from the cultivation of the vine, from an impression that great skill is necessary. The vine requires less science in its cultivation than the peach or apple tree; and the manufacture of wine is a more simple process than that of cider. Cleanliness and a careful exclusion of unripe and decayed fruit are the great requisites. Wines may be improved after they are completed, by a mixture of the strong with the weak, the dry with the sweet, the flavorless with that possessing a high flavor; but this is the province of the wine-merchant.

"Again, it is said we cannot succeed with the manufacture of wine, because the addition of sugar is necessary to our grapes to give them the requisite sweetness. I have wine of my

own manufacture, now six years old, the pure juice of the grape. But in all wine countries, unless it be in those where light hard wines are made, sugar is added, or its equivalent. In Madeira, Xerxes, Oporto, various methods are resorted to. The grapes are suffered to hang till a bunch of raisins can be plucked—or a portion of the must is boiled down, till its fermenting quality is destroyed, and its saccharine nearly doubled, or a portion of the unfermented must is mixed with such a quantity of brandy as to stop the process of fermentation, and these are added to the must or wine. After the wine is perfected, from five to twelve per cent. of brandy is added. Even in the sunny clime of Italy, to enable their wine to keep without the addition of sugar, they boil the must, and the wine so made is called 'Vino Cotto.' In Germany and France, sugar is frequently added. But in all these cases the fermentation is checked before its completion, and the leaven precipitated by sulphuring and frequent racking. From experience, I am perfectly satisfied that it is immaterial whether the saccharine principle be in the grape or added to the must in the form of sugar.

"The reason so many have failed in the manufacture of domestic wine, is that, instead of making American wine, they have, by the process of manufacture, attempted to produce an imitation of popular foreign wines.

"The Schuykill, Muscadell or Cape grape, the Isabella or Catawba, are the American grapes most in use for the manufacture of wine. The first by age becomes a good wine. The second will make a rich, sweet wine, by the process of manufacture necessary to accomplish this object, but it does not improve by age. From the Catawba, Major Adlum makes a rich, sweet wine. The wine which I manufacture from this grape is a light, dry wine, resembling those of the Rhine, and will successfully compete with any of them, but they are wines now for the first time coming in use among us, and command a high price.

"I have two other native grapes under cultivation, from which I have yet made only a few quarts of wine of great promise. They are also first-rate table grapes. The best wine of American manufacture that I have seen resembling Madeira, is made by a French gentleman of great intelligence, in S. Carolina, Mr. Herbe-mont. He sent me a sample. It is made from a grape called the Warren, or Herbe-mont's Madeira. I obtained this grape from him four years since, and do not hesitate to pronounce it an American grape, common in North Carolina, and to be found as far west as Missouri. As a table grape, it is equal to many imported varieties.

"In deciding how far the grape may be cultivated with us for profit, experience is better than theory. Nine years since I bought thirty acres of very broken ground four miles from the city, for which I paid three hundred dollars. There were about fifteen acres of cleared land, and about one half tillable. On this place I put an elderly German with a small family. He was to plant and cultivate a vineyard and have one half the product. Every thing raised by him on the place was for his own use. He spoke no English; was not worth ten dollars; and possessed of no learning. The vineyard was neglected, and made a secondary object; whilst he supported his family by raising vegetables for market. At the end of seven years his vineyard was less advanced than it should have been at the end of four years. The eighth year a part of his vineyard produced one thousand seven hundred gallons of wine to the acre. This encouraged him: his garden was neglected and his attention devoted to the vineyard. This season, 1833, his share of the wine will enable him to purchase from the government five hundred acres of land; and he has already made a purchase for each of his children. He can cultivate the grape as his fathers have done before him, in Germany; but he can make no changes to suit the difference of our climate, and I would sooner de-

pend upon a man of good common sense, who had no experience in its cultivation, than most of the German vinedressers. I name this, not in disparagement of a frugal industrious part of our population, but to remove an impression that foreigners only are competent to the cultivation."

DUTCH CHURNS.—When the churning process was going on, I have observed the outside of the churn wrapped over with cloth, which I was told was for the purpose of keeping the outside clean. The Dutch have various ways of working the churn. At the large dairies it is generally with a horse; this I observed near Delft, at Ter Leide, near Leyden, and near Leuwarden, in Vriesland; at others they are churned by the hand, by turning a large fly-wheel,

(figure 1.) At Almenaar, near Harlingen, I saw a churn made to go by the feet, the weight of the body being moved alternately from one side to the other, on a platform fixed on a pivot (fig-

ure 2); to the one end of the platform a stalk being attached, which moved the churn-handle attached to another pivot. I observed at a farm near Gouda, that the churn was made to work from the ceiling in a very easy way; a piece of wood in the shape of an obtuse angle, was attached at the elbow to a pivot in one of the beams of the ceiling; the churn-stick was attached to the one end, and it was worked up and down by the hand at the other end, (figure 3.)

And in North Holland they churn by means of dogs in wheels, in a similar way to the turn-spits.—[Quarterly Journal of Agriculture.]

Directions for the Use of Bone Manure. By Mr. OGDEN. [From the New-York Farmer and American Gardener's Magazine.]

MR. EDITOR: Sir,—Permit me, through the medium of your useful paper, to present to the agricultural community some hints on the use of ground bone for manure. The first and great object is to have the bone dust well fermented. The process is very simple—nothing more being necessary than to dampen it sufficiently to set it fermenting. The best method, however, is to make a compost of it with stable or yard manure, and let it ferment together. After it is fermented, it answers a very good purpose as top dressing for grass or winter grain, and may be applied early in the spring. If it is spread at the time of sowing, at the rate of 30 to 35 bushels per acre, it is harrowed in. This manure is applied with good effect to corn in the hill. Instances, however, of its too free use in this way have been known to fail; I should, therefore, recommend it to be applied broadcast. On a dry soil, especially, it is very beneficial to potatoes, particularly in a state of a fermented compost.

I would again repeat, that the great mystery in using bone is to have it fermented.

Even old bones, that have been bleaching for scores of years in the fields, when ground, will very easily ferment and make an enriching and active manure. Gardeners will find many advantages in the use of bone. It does not introduce weeds, nor insects, but is considered prejudicial to the latter. Its small bulk, lightness of carriage, and great durability, are some of its general recommendations.

Brooklyn, February, 1834.

The Use of Ground Corn and Cobs. By Mr. OGDEN. [From the N. Y. Farmer.]

MR. EDITOR,—I have been for some time using corn and cobs ground together for my cattle, and with good effect. It is an impression among farmers that there are some injurious effects arising from its use. I will state how they may be avoided. In the first place, the corn should be perfectly ripe. In the second, a large quantity should not be ground at a time. It should be kept perfectly dry, for a little moisture will cause the cob to mould. In the third, when this food is used constantly, potatoes or carrots should be given two or three times a week. With these precautions, the cob and corn ground together will be a wholesome and cheap food for cattle. I give my horses eight quarts per day, and, notwithstanding they labor hard, they gain in flesh and perform well.

I grind my corn and cobs in the bone mill, which will turn out many bushels in the course of an hour.

GOOD AND POOR FRUIT IN THE SAME ORCHARD.—The subjoined paragraph is from Dr. Thatcher's American Orchardist. It is generally supposed that the mixing of the farina will not effect the fruit, but the seed only—that this is the method of nature to obtain new varieties. It would be well, however, for those having opportunity, to make observation.

A precaution is suggested that apple trees bearing bad or ordinary fruit should not be suffered to grow with those which bear fruit of a superior quality. It is a fact with which gardeners are familiar, that the blossoms of cucumbers will greatly injure the flavor of melons that grow near them; and it is reasonable to suppose that fruits, while forming on the trees, are liable in like manner to suffer deterioration. The result of the following experiment would seem to strengthen the above conjecture. The experiment, it is said, has in numerous instances succeeded without a single failure. In an orchard containing a great variety of apple trees bearing sweet, and some very acid fruit, and others partaking of both these properties, in the vernal season, when the trees are in full blossom, the pollen (or impregnating dust) was taken from one tree (for example, where the fruit is very sweet,) and deposited on the flowers of a particular branch of another tree, whose fruit is extremely acid. The apples of that particular branch were found to combine these two properties for that season, and by this simple process, the experimenter asserts, he can easily provide himself with apples for that season perfectly to his taste, which he considers much more expeditious and equally as certain a process as that of grafting.

CLOVER AMONG CORN.—A friend of mine sowed red clover among his corn after going through with the cultivator the last time, the seed was protected from the heat of the sun by the corn, it consequently vegetated very soon, and after the corn was cut off, there was a luxuriant growth of clover, which afforded fine pasture for several successive seasons. The red clover is an excellent manure: I have raised a fine crop of wheat, by ploughing in the second growth after harvest.—[Am. Farmer.]

NEW-YORK AMERICAN.

MARCH 15—21, 1834.

LITERARY NOTICES.

THE WRITINGS OF GEORGE WASHINGTON, *being his Correspondence, Addresses, Messages, &c. &c., with a life of the author*: by JARED SPARKS; vols. II and III: Boston, Russell, Odiorne & Metcalf, and Hildard, Gray & Co.—In point of typographical embellishment and execution, these volumes are worthy of the matters and the name they are meant to illustrate. They are, in truth, admirable. Vol. I, to contain a life of Washington, is to be published while the work, which may extend to twelve volumes, is in progress. Of the two now given to the public, vol. II is occupied with letters and papers written by Washington before the American Revolution, and relate chiefly to the French war of 1756, in which he was so largely and so actively engaged. The whole of his career, from the time he joined Braddock till he retired from the army, is here recorded by himself. In an Appendix there is an elaborate and well reasoned article by the Editor, completely exonerating Washington from the only charge ever brought with any plausibility against his honor and good faith as a soldier—that of having commanded his troops, being then only 22 years of age, to fire on a French detachment commanded by Jumonville, sent to him, as the French allege, with a flag of truce; in the act of reading a peaceful summons to him to retire from lands claimed to be within the French limits, Jumonville fell. This story, founded originally upon the exaggerated report of a runaway French soldier, is most conclusively disproved; and it is shown that in firing on Jumonville's detachment, which had been lurking for some days around the camp of his own feeble band, Washington "did no more than execute the duty of a vigilant officer, for which he received the unqualified approbation of his superiors and of the public." Among the specimens, also given in the Appendix, of the early writings of Washington, there is a series of rules copied or compiled probably from various sources, entitled "Rules of civility and decent behaviour in company and conversation." We will, if we can find room to-day, annex some of these rules—if not, at some other time—as they manifestly exercised no little influence in the formation of Washington's character.

Vol. III, which commences the correspondence and papers relative to the Revolution, opens very appropriately with Washington's answer to Congress, on 16th June, 1775, accepting his appointment as commander-in-chief. The volume is devoted to letters and papers written in that capacity, to other general affairs to Congress, to provincial Congresses, and reaches to July, 1777. The political as well as personal considerations which led to the selection of General Washington, as commander-in-chief, and the noble devotion of New England, and of that thorough patriot, John Adams, one of her chief representatives, in suggesting and concurring in the choice of a Virginia general, to command armies wholly recruited at that time from the New England States, are ably exhibited in a note of the editor in the appendix.

Our only extract is the touching letter, so full of unfeigned humility—of true affection—and withal of unhesitating patriotism, in which General Washington communicated to his wife the news of his appointment to the command in chief. This is the only letter, Mr. Sparks says in a note, "from Washington to his wife, which has come into my hands. It is understood that Mrs. Washington destroyed all his other letters to her a short time before her death."

TO MRS. MARTHA WASHINGTON.

Philadelphia, 18th June, 1775.

"My Dearest—I am now set down to write to you on a subject which fills me with inexpressible concern; and this concern is greatly aggravated and in-

creased, when I reflect upon the uneasiness I know it will give you. It has been determined in Congress, that the whole army raised for the defence of the American cause shall be put under my care, and that it is necessary for me to proceed immediately to Boston, to take upon me the command of it. You may believe me, my dear Patsy, when I assure you, in the most solemn manner, that, so far from seeking this appointment, I have used every endeavor in my power to avoid it, not only from a consciousness of its being a trust too great for my capacity, and that I should enjoy more real happiness in one month with you at home, than I have the most distant prospect of finding abroad, if my stay were to be seven times seven years. But as it has been a kind of destiny that has thrown me upon this service, I shall hope my undertaking is designed to answer some good purpose.

You might, and I supposed did perceive, from the tenor of my letters, that I was apprehensive I could not avoid this appointment, as I did not pretend to intimate when I should return. That was the case. It was utterly out of my power to refuse this appointment, without exposing my character to such censures as would have reflected dishonor upon myself and given pain to my friends. This, I am sure, could not, and ought not, to be pleasing to you, and must have lessened me considerably in my own esteem. I shall rely, therefore, confidently on that Providence, which has heretofore preserved and been bountiful to me, not doubting but that I shall return safe to you in the fall. I shall feel no pain from the toil or the danger of the campaign; my unhappiness will flow from the uneasiness I know you feel from being left alone. I therefore beg that you will summon your whole fortitude, and pass your time as agreeably as possible. Nothing will give me so much sincere satisfaction as to hear this, and to hear it from your own pen. My earnest and ardent desire is, that you would pursue any plan that is most likely to produce content, and a tolerable degree of tranquility; as it must add greatly to my uneasy feelings to hear that you are dissatisfied or complaining of what I really could not avoid.

"As life is always uncertain, and common prudence dictates to every man the necessity of settling his temporal concerns, while it is in his power, and while the mind is calm and undisturbed, I have, since I came to this place, (for I had not time to do it before I left home) got Colonel Pendleton to draft a will for me, by the directions I gave him, which will I now inclose. The provisions made for you in case of my death will, I hope, be agreeable.

"I shall add nothing more, as I have several letters to write, but to desire that you will remember me to your friends, and to assure you that I am, with the most unfeigned regard, my dear Patsy, your affectionate, &c."

We can desire nothing better for our country, than that in these days of party selfishness and political corruption, the pure self sacrificing virtue which is exemplified more and more, as new light is thrown upon the motives and character of Washington, may be widely studied and imitated.

ESSAYS on the principles of Morality, and of the Private and Political Rights and Obligations of Mankind; by JONATHAN DYMOND: with a Preface by the Rev. GEO. BUSH, M. A.; 1 vol. 8vo, pp. 432; N. York, HARPER & BROTHERS.—Considering the age, the calling, and the circumstances of the writer, this book may be pronounced in every way remarkable. JONATHAN DYMOND was a member of the Society of Friends, who kept a small linen draper's shop in a country town in England. He wrote and reasoned of the high matters with which the volume before us is fraught, "in a little room adjoining his shop, subject to frequent interruptions from customers in the midst of his most profound and interesting speculations," and died in the early morning of life. When, then, it is added that he has produced a work characterized by deep reflection, severe logic, and a forcible and well ordered style; a work founded on the Bible as the first, and original, and unerring code of ethics; a work which at once enters the lists with a writer like Paley, and taking up and examining his doctrines of expediency and utility as the basis of moral obligation, triumphantly "battles the fallacies of such spurious and dangerous" propositions, we

have said enough to call general attention to this volume. There are many opinions in it indeed tinged with the peculiar color of the author's sect—there are some from which most readers may dissent; but as a work inspired by the purest views and purposes, and reposing for its foundation and sanction upon the book of Truth, it will command unqualified approval. Prof. Bush and the publishers have done good service to the cause of morals in thus bringing it before the American public. There are occasional notes by Prof. Bush, indicated by the initial B., which may serve to qualify the assent that might otherwise by unreflecting minds be given to some of the peculiar and perhaps erroneous notions of the author.

As a specimen both of the author's style and manner of viewing questions, we subjoin his chapter on the Law of Honor:

The Law of Honor.—The law of honor consists of a set of maxims, written or understood, by which persons of a certain class agree to regulate, or are expected to regulate their conduct. It is evident that the obligation of the law of honor, as such, results exclusively from the agreement, tacit or expressed, of the parties concerned. It binds them *because* they have agreed to be bound, and for no other reason.—He who does not choose to be ranked among the subjects of the law of honor is under no obligation to obey its rules. These rules are precisely upon the same footing as the laws of free-masonry, or the regulations of a reading-room. He who does not choose to subscribe to the room, or to promise conformity to masonic laws, is under no obligation to regard the rules of either.

For which reasons, it is very remarkable that at the commencement of his moral philosophy, Dr. Paley says, *the rules of life* "are, the law of honor, the law of the land, and the Scriptures." It were strange indeed, if *that* were a rule of life which every man is at liberty to disregard if he pleases; and which, in point of fact, nine persons out of ten do disregard without blame. Who would think of taxing the writer of these pages with violating a "rule of life," because he pays no attention to the law of honor? "The Scriptures" communicate the will of God; "the law of the land" is enforced by that will; but where is the sanction of the law of honor?—It is so much the more remarkable that this law should have been thus formally proposed as a rule of life, because in the same work it is described as "unauthorized." How can a set of unauthorized maxims compose a rule of life? But further: the author says that the law of honor is a "capricious rule, which abhors deceit, yet applauds the address of a successful intrigue." And further still: "it allows of fornication, adultery, drunkenness, prodigality, duelling, and of revenge in the extreme." Surely then it cannot, with any propriety of language, be called a rule of life.

Placing, then, the obligation of the law of honor, as such, upon that which appears as its proper basis,—the duty to perform our lawful engagements—it may be concluded, that when a man goes to a gaming-house or a race-course, and loses his money by betting or playing, he is morally bound to pay: not because morality adjusts the rules of the billiard-room or the turf, not because the law of the land sanctions the stake, but because the party *previously promised* to pay it. Nor would it affect this obligation to allege, that the stake was itself both illegal and immoral. So it was; but the payment is not. The payment of such a debt involves no breach of the moral law. The guilt consists, not in paying the money, but in staking it. Nevertheless, there may be prior claims upon a man's property which he ought first to pay. Such are those of lawful creditors. The practice of paying debts of honor with promptitude and of delaying the payment of other debts, argues confusion or depravity of principle. It is not honor, in any virtuous and rational sense of the word, which induces men to pay debts of honor instantly. Real honor would induce them to pay their lawful debts *first*: and indeed it may be suspected that the motive to the prompt payment of gaming debts is usually no other than the desire to preserve a fair name with the world. Integrity of principle has often so little to do with it, that the principle is sacrificed in order to pay them.

With respect to those maxims of the law of honor which require conduct that the moral law forbids, it is quite manifest that they are utterly indefensible. "If unauthorized laws of honor be allowed to create exceptions to Divine prohibitions, there is an end of all morality as founded in the will of the Deity, and the obligation of every duty may at one time or other be discharged."* These observations apply to those foolish maxims of honor which relate to duelling.—

These maxims can never justify the individual in disregarding the obligations of morality. He who acts upon them acts wickedly; unless indeed he be so little informed of the requisitions of morality that he does not upon this subject perceive the distinction between right and wrong. The man of honor therefore should pay a gambling debt, but he should not send a challenge, or accept it. The one is permitted by the moral law, the other is forbidden.

Whatever advantages may result from the law of honor, it is, as a system, both contemptible and bad. Even its advantages are of an ambiguous kind; for although it may prompt to rectitude of conduct, that conduct is not found upon rectitude of principle. The motive is not so good as the act. And as to many of its particular rules, both positive and negative, they are the proper subject of reprobation and abhorrence. We ought to reprobate and abhor a system which enjoins the ferocious practice of challenges and duels, and which allows many of the most flagitious and degrading vices that infest the world.

The practical effects of the law of honor are probably greater and worse than we are accustomed to suppose. Men learn, by the power of association, to imagine that *that* is lawful which their maxims of conduct do not condemn. A set of rules which inculcates some actions that are right, and permits others that are wrong, practically operates as a sanction to the wrong. The code which attaches disgrace to falsehood, but none to drunkenness or adultery, operates as a sanction to drunkenness and adultery. Does not experience verify these conclusions of reason? Is it not true that men and women of honor indulge, with the less hesitation, in some vices, in consequence of the tacit permission of the law of honor? What then is to be done but to reprobate the system as a whole? In this reprobation the man of sense may unite with the man of virtue; for assuredly the system is contemptible in the view of intellect, as well as hateful in the view of purity.

Mer. and Pol. Phil. b. 3, c. 9.

THE AMERICAN QUARTERLY REVIEW, No. XXIX. Philadelphia: KEY & BIDDLE.—A number this—of great vigor of writing and variety of topics. We can only allude today to two or three of the papers. That on Theodore Dwight's History of the Hartford Convention is capital. It does ample justice to a work which itself does justice to a much calumniated set of public men and acts; and which will be hereafter received as unquestionable historical evidence, however party prejudice may at this day obscure its force. The paper on *England and America*, is searching and scorching. It is, we should be tempted to believe—though without having heard a word on the subject—from the same acute pen, and investigating mind, which produced the vindication of Sebastian Cabot. Mrs. Willard's letters from France are spoken of, without favor; and we must even admit, though harshly, without injustice. It were better, certainly, that they had remained in the portfolios of those to whom they were written. From the article respecting them, we extract some observations, on the tone and composition of French society, which we commend to our readers.

But Mrs. Willard's grand objection to Parisian society, is its want of a proper regard for morality.—Though we may feel inclined to smile at one of the causes she assigns for her belief in the justness of the charge—that “once, in a room where few persons were present, she saw, by a sudden turn, a lady of whom she never heard ill, touch her lips to the neck of a gentleman, as he stooped for some object beside her,”—it cannot altogether be denied. We really think, however, that the ideas generally entertained on that head, in our country, are greatly exaggerated. There may be vice, but it does not exhibit itself; our authoress acknowledges that “nothing can be more modest than the demeanor in society of all she met,” and as long as external propriety is preserved, there can be no risk for those who are not disposed to seek occasions for sin. As to her complaint of never hearing “characters scanned in Paris as in America, as to the moral tendency of their actions,” we do not know exactly whether to be amused or angry with it. The fondness of ladies for “scanning characters” is an old joke against them, and if we change the final syllable of the first word of the quoted phrase into *dat*, we shall have the invariable result of the operation; but what business;

have people, either here or in Paris, to scan the characters of others, whose conduct, apparently, violates none of the rules of decorum? We would reverse the complaint, and lament that we do not imitate the Parisians in not meddling with the concerns of others, when we have no right or warrant for the interference. As long as no evil is inflicted upon the well-being of society by the visible conduct of our neighbors, we hold that its interests are best consulted by a universal regard to the venerable injunction, “mind your own business.” If the “moral tendency of the actions” of every one, is to be made the subject of reciprocal investigation, the millenium of dowagers is certainly at hand; but preserve us from becoming the theme of a knot of them firmly seated around a tea-table on a Sunday evening!

Whatever may have been the fact at a former period, we do not believe that, at present, a lady of respectable character would be permitted to appear at the French court; and we do not doubt that, under proper guidance, a young lady might frequent the society of Paris with as much safety, as that of any city of the globe. We say under proper guidance, for, of course, in so varied and extensive an assemblage, no matter what might be its general excellence, circumspection and caution are indispensable. The freedom which is enjoyed in this country by the youthful portion of the sex, is only compatible with the smallness and compactness of our circles, where every one is, as it were, a guard upon every one.—Whenever fashionable intercourse here swells to the dimensions it possesses in the principal cities of Europe, that freedom must inevitably be abridged, and a system adopted with regard to young ladies similar to the one which is there pursued.

Would that we could model our society in some other respects upon that of Paris! that we could imitate the ease, the courtesy, the refinement, the disposition to please and to be pleased, the spirit of mutual concession, the faculty of extracting amusement from every thing and any thing, which never allow you there to ejaculate with the poet, in a fit of despondency and *ennui*,

Business is labor, and man's weakness such,
Pleasure is labor too, and dures as much;

but which, on the contrary, render pleasure that perfect relaxation so conducive afterwards to a cheerful and adequate attention to business. The French have unquestionably carried society to as high a degree of perfection as it can well be brought. Their talent, in this respect, almost strikes a stranger with wonder. A stupid party—a phrase, alas! which is as natural in an American mouth as freedom, liberty and independence—is a thing which they could scarcely be made to comprehend. Let any number of them congregate together, and megrim takes to flight with as much precipitation as the owl from the garish light of day. Every one contributes his or her quota to the general stock of amusement; a sombre visage is a mark of rudeness and ill-breeding; and on separating, all are disposed to repeat the exclamation of Moore's enraptured lover, “how swift the hours fly.” He that is pleased himself must always others please, is an observation of Shakespeare, which is no where so abundantly confirmed as in a Parisian *réunion*. Mere amusement, however, is not all that a stranger gains by “going out” in Paris. The manner in which men of the greatest distinction in every way, in politics, in science, in literature, in art, mix in society there, furnishes him with ample opportunity of gratifying a laudable curiosity, and blending instruction with pleasure. Wherever he goes he may be always sure of encountering some one whom he must feel a desire to see, and whose acquaintance he will find no difficulty in making. Their rational politeness and affability are sufficient to embolden him to trouble them for a while with his insignificance, and thus acquire a source of agreeable recollection—in all probability of material advantage. This circumstance of the constant communion of such men with society, imparts to it, in a certain degree, an atmosphere of intellectuality which relieves and vivifies, if we may so speak, its unavoidable frivolousness, and may be said to act as an antidote to the bane of dissipation. In our country, unfortunately, men of eminence are so little addicted to frequenting the scenes of fashionable enjoyment, or when they do appear in them, it is with so slight a desire to take the prominent parts which they should perform, that society has fallen entirely into the hands of the young, and presents that aspect on which foreigners have so often remarked, of being little better than a boys' and girls' romp, where aught that is intellectual is sadly out of place. This is the reason, indeed, which the older and wiser portion sometimes assign

for keeping in the back ground; but it is their own fault if it exists. Had they not resigned their proper stations at first, they would never have had cause to complain that society is totally destitute of attraction in their eyes; and should they now resume and exert their rights, a beneficial alteration must speedily ensue. Some standard of social distinction, of a more elevated order than spruce attire and proficiency in dancing, would then be introduced; young ladies would learn to appreciate other qualifications as more attractive and distinguished, and young gentlemen would feel a nobler ambition in relation to society than they can possibly do now, when mental cultivation and superiority are “of no mark or likelihood” whatever.

There are two other points in which it would be for the advantage of our society if the Parisian practice were followed. The first is that entertainment with the good things of this life, which seems to constitute in our minds the most important appurtenance of a party of every description. Eating is a never-ending, still beginning affair, on such occasions; your guests, like a ship before the wind, must constantly be “kept full,” and as this entails considerable expense, it may furnish one explanation why those really sociable meetings, which make so delightful a source of relaxation in Paris, are of such rarity here. The necessity, as it is deemed, of providing an abundance of amusement for the palate, no matter how small the assemblage, operates to prevent the keeping of open-house, which is so conducive to familiarity and good feeling, and imparts an air of pretension and formality, productive of a chilling effect upon “the genial current” of one's spirits. In Paris, a glass of lemonade, or orange and water, together with a little cake, if that—is all the provision which is made for your physical man, at a common *séjour*, and more would only annoy you by interrupting the course of amusement; but here, you can scarcely open your mouth unless to swallow a cup of coffee, an ice, a jelly, chicken salad, pickled oysters, or some other ethereal comestible, following each other in such rapid succession, that little else can be accomplished, than to do justice to them like every body else.—Then for a visitation, after you have retired to your couch, from that agreeable companion, the nightmare, or, the next day, from the pleasant sensations which dyspepsia occasions. The other point is the answering of invitations for an evening party—unless it be a setting supper, where it is requisite to know what number is to be present, which is never done abroad, and is an inconvenience to the invited, and of no moment to the inviter. The latter may be always sure of a quorum, whilst the former, in many instances, may not be able to tell whether it will be in their power or not to appear, and acting upon this uncertainty, often send a refusal, when eventually they find that they might go. Besides, unnecessary trouble is given to servants in taking the answers, a useless consumption of their time is caused, and for one circulation generally in “the world,” writing so many notes is not the most fascinating mode of employing leisure moments.

As always happens, when we imitate others, whilst we have rejected those customs of European society which it would be beneficial for us to pursue, we have adopted one which we have no business with whatever—we allude to the habit of going at a late hour to a party. In Europe, where the whole arrangement of life is different, where, in particular, the dinner hour is six or seven o'clock, this is unavoidable, and in keeping with every thing else; but, in this country, where, at four o'clock, for the most part, the cloth is removed from the table, what can be more nonsensical than to delay to repair to a ball until ten? It is quite as dark in winter at seven as at any period of the night; and there is no reason why as much pleasure cannot be enjoyed then as afterwards. Were it fixed upon as the time for assembling, many a stupid moment, we doubt not, would be escaped by those who are waiting impatiently and idly for the hour when they may depart for the festive scene, without endangering their ton, and many a rose would continue to bloom in cheeks from which they have disappeared under the blighting influence of vigils protracted long beyond the stroke of the midnight bell.

ENGLAND AND AMERICA—a Comparison of the Political and Social State of both Nations. 1 vol.—N. York: Harper & Brothers.—This volume—of so swelling a title and of great pretensions—which has been absurdly enough ascribed to the pen of Bulwer—is conclusively shewn by an article in the last *American Quarterly Review*, to be a re-publication

of a tract originally put forth in London by a knot of private land speculators, who were desirous of entrapping the British government into a scheme of colonizing the paupers of England in Australasia, for the benefit of those who should previously have monopolized the property in the soil there. Failing in that, their attention seems to have been turned to the U. States, and the absurd hope conceived, that by representing the immense advantage to this country of a large and constant supply of laborers from Europe, in peopling our waste lands—the government might be induced to pay for importing these laborers—employing the agency of these speculators, who were to be a sort of Colonization Society; and who, by speculating in our lands and in the cost of transporting their pauper countrymen, were to find their reward.

Such is clearly established to be the character of this book; and as such, therefore, we leave it to the contempt of the reading public.

Good's Book of Nature, abridged from the original work. Boston, ALLEN & TICKNOR.—This is a happy notion, happily carried out. It is—by extracting and putting in short sentences, and in plain and intelligible language, the various amusing and instructive facts contained in Good's Book—to adapt them readily to the comprehension of children and young people. This is further aided by numerous well executed cuts—and by annexing to each paragraph or section, a question, by the answer to which, it may be at once ascertained whether the fact imparted has been understood. We can recommend this little book unhesitatingly, to parents.

It may be had of Goodrich & Wiley.

THE EVERGREEN, a collection of stories for childhood and youth, with 20 plates. By—WEST—Boston. LULLY, WAIT & Co., This, like the foregoing, is another contribution to the cause of youthful instruction—by seeking to render it attractive, as well as beneficial—and interesting the youthful learner, by stories and plates adapted to his comprehension, in those moral lessons, which, in a less winning form, might be deemed repulsive. The stories are mostly original, and the plates are well executed.

FOREIGN INTELLIGENCE.

By the *Caledonia*, from Liverpool, we have London papers to the evening of 1st February. They have nothing as late from the Continent as we had previously received via Havre, and in England all seemed to be pretty tranquil. Parliament would meet for business on the 5th February. A few extracts are annexed:

LIVERPOOL, FEB. 1.—Parliament resumes its legislative labors on Tuesday next, and perhaps less was expected when it assembled twelve months since, in all the odor of reform, than at the present moment. Then it was inexperienced, a new system was to be tried; and new men were to develop their views.—Now however, the time for action had arrived; measures of deep moment cannot be longer postponed; and the advocates and opponents of reform in detail, are alike agreed that disputed questions must be finally adjusted.

There are six questions which will especially demand the attentive consideration of Parliament, and from which it cannot from any possibility escape. They are, I. Church Reform; II. Claims of the Discontenters; III. the Corn Laws; IV. Repeal of the Assessed Taxes; V. Poor Laws for Ireland, and an alteration in the English system; and VI. Corporation Reform.

A Portuguese ship of war is still lying off Gravesend. Various rumors are afloat as to the cause of the visit, the most probable which is, that she is engaged in watching the movements of Miguel's friends in the River. Two of the harbors on the opposite coast are said to be watched in a similar manner.

Messages of Ministers.—The Speech on the opening of the Sessions of Parliament, will, it is expected, be submitted to his Majesty at a Council to be held on Friday or Saturday (to-day). The extent to which the reduction of the assessed taxes will proceed has been formerly announced. The house tax will be

wholly repealed; but the duty upon Windows, and other assessed taxes upon houses, carriages, &c. will be continued until a more favorable state of the revenue will allow of their reduction or repeal.

The Wool Trade.—There has been considerable activity in the market for long wool, which has caused prices to advance in a very remarkable manner.—A few days ago a large grower in Romney-mareh disposed of his whole growth for £23 a pack, conditionally, that he should receive any advance that might take place up to a certain period. The price is now £24, and should the present demand continue, no doubt it will increase to £25, and even £26.—[*Kentish Chronicle*.]

The subjoined advertisement from Galignani's Paris Messenger, is a specimen of a Paris fashion:

"Matrimony.—A sum of 6000 fr. will be paid to any person who may be able to arrange a union between a French gentleman, aged 42, a bachelor, and bearing the title of Marquis, with an English lady of adequate fortune. A bond for the stipulated premium, payable on the conclusion of the marriage, will be deposited in the hands of a notary. Address M. Le Baron D. H., Poste Restante, à Paris."

LATER FROM ENGLAND.—The *Samuel Robertson*, from London, brings Portsmouth papers of 8th ult.

The chief items of interest follow:

The dates from Spain are still not as late as those which have already reached us, nor is there any further news from Portugal. From Paris, the accounts are to one day subsequent to the funeral of M. Du-long, killed in a duel with General Bugeaud. This ceremony passed over without any disturbance.

The King of England opened the new session of Parliament on the 4th Feb. We give his Speech below, with a sketch of the proceedings, which followed from the London Courier. These, it will be seen, do not possess any points of greater interest here.

HOUSE OF LORDS, Tuesday, Feb. 4.

His Majesty this day opened the session of Parliament in person.

At half-past 1 the Lord Chancellor took his seat on the wool-sack.

His Majesty, attended by the usual Ministers of State, entered the House at a quarter after 2 o'clock. His Majesty, we are happy to say, looked very well. He appeared to be in excellent health.

The commons having been summoned, about 200 of them, headed by the Speaker, immediately presented themselves at the bar, when his Majesty proceeded to read, in a distinct and audible voice, the following gracious speech:

My Lords and Gentlemen—In calling you again together for the discharge of your high duties, I rely with entire confidence on your zeal and diligence, on your sincere devotion to the public interests, and your firmness in supporting on its ancient foundations, and in the just distribution of its powers, the established Constitution of the State. These qualities eminently distinguished your labors during the last session, in which more numerous and more important questions were brought under the consideration of Parliament than at any former session, of equal duration. Of the measures which have in consequence received the sanction of the Legislature, one of the most difficult and important was the bill for the abolition of slavery. The manner in which that beneficial measure has been received throughout the British Colonies, and the progress already made in carrying it into execution, by the Legislature of Jamaica, affords just grounds for anticipating the happiest results.

Many other important subjects will still call for your most attentive consideration. The reports which I will order to be laid before you from the commissioners appointed to inquire into the state of the municipal corporations; into the administration and effect of the poor laws, and into ecclesiastical revenues and patronage in England and Wales, cannot fail to afford you much useful information, by which you will be enabled to judge of the nature and extent of any existing defects and abuses, and in what manner the necessary corrections may in due season be safely and beneficially applied.

It has been the constant aim of my policy to secure to my people the uninterrupted enjoyment of the blessings of peace. In this I have been much assisted by the good understanding which has been so happily established between my government and that of France; and the assurances which I receive of the friendly disposition of the other powers of the Continent, give me confidence in the continued success of my endeavors.

I have however to regret that a final settlement between Holland and Belgium has not yet been ef-

fected, and that the civil war in Portugal still continues. You may be assured that I shall be careful and anxious to avail myself of any opportunity which may afford me the means of assisting the establishment of a state of serenity and peace in countries, the interests of which are so materially connected with those of my dominions.

Upon the death of the late King of Spain, I did not hesitate to recognize the succession of his infant daughter, and shall watch with the greatest solicitude the progress of events which may effect her government and independence, the peaceable settlement of which is of the first importance to this country, as well as the general tranquility of Europe.

The peace of Turkey, since the settlement that was made with Mahomet Ali, has not been interrupted; and will not I trust be threatened with any danger. It will be my object to prevent any change in the relations of that empire with other powers, which might endanger its future stability.

Gentlemen of the House of Commons—I have directed the Estimates for the ensuing year to be laid before you.

They have been framed with a view to the strictest economy and to such reduction as may not be injurious to the public service.

I am confident that I may rely on your enlightened patriotism, and on the cheerful acquiescence of my people for supplying the means which may be required to uphold the honor of my Crown, and the interest of my dominions.

The accounts which will be laid before you of the state of the Revenue, as compared with the Expenditure will be found most satisfactory.

My Lords and Gentlemen—I have to lament the continuance of distress amongst the proprietors and occupiers of land; though, in other respects, the state of the country, both as regards its internal tranquillity and its commerce and manufactures, affords the most encouraging prospect of progressive improvement.

The acts passed in the last session for carrying into effect various salutary and remedial measures in Ireland are now in operation, and further improvements may be expected to result from the commissions which have been issued for other important objects of inquiry.

I recommend to you the early consideration of such a final adjustment of the tithes in that part of the United Kingdom as may extinguish all just causes of complaint, without injury to the rights and property of any class of my subjects, or to any institution in Church or State.

The public tranquillity has been generally preserved, and the state of all the provinces of Ireland presents, upon the whole, a much more favorable appearance than at any period during the last year.

But I have seen with feelings of deep regret and just indignation, the continuance of attempts to excite the people of that country to demand a Repeal of the Legislative Union. This bond of our national strength and safety I have already declared my fixed and unalterable resolution, under the blessings of Divine Providence, to maintain inviolate by all the means in my power. In support of this determination, I cannot doubt the zealous and effectual co-operation of my Parliament and my people.

To the practices which have been used to produce disaffection to the State, and mutual distrust and animosity between the people of the two countries, is chiefly to be attributed the spirit of insubordination which, though for the present in a great degree controlled by the power of the law, has been but too perceptible in many instances.

To none more than to the deluded instruments of the agitation thus perniciously excited is the continuance of such a spirit productive of the most ruinous consequences; and the united and vigorous exertions of the loyal and well affected, in aid of the Government, are imperiously required to put an end to a system of excitement and violence, which, while it continues, is destructive of the peace of society, and, if successful, must inevitably prove fatal to the power and safety of the United Kingdom.

Having delivered his speech, His Majesty retired. Prayers were then read, and the house was adjourned during pleasure.

[From the London Courier.]

The address of the House of Lords last night was moved by the Duke of Sutherland in a neat and temperate speech, in which his Grace very ably paid a well merited compliment to the Earl of Mulgrave. He also dwelt with evident satisfaction on the union between France and England, rejoicing in the efforts which are now making to cultivate industry and the arts of peace among that warlike people.—Lord Howard of Effingham, in seconding the Ad-

dress, referred chiefly to Ireland, and strongly recommended moderation and good temper, while no interest should be looked to but that of the whole people.

The Duke of Wellington, the only Peer who spoke in opposition, while he professed his intention not to oppose the address, made a long, and we must say, a very unfounded attack on the Ministers, going again over all the grounds which he and the Earl of Aberdeen so repeatedly trod last session. His Grace attributed the continuance of the civil war in Portugal to the countenance of this Government. Earl Grey reminded the noble Duke that our ships were only sent to Portugal to protect our own subjects, and it had been alleged that those ships strengthened the cause of Don Miguel. The Duke said that the civil war in Spain grew out of the civil war in Portugal; assigning as the reason that Don Carlos had found refuge there instead of going to Italy. But would he not have found refuge there and support, had Don Miguel been seated on the throne? In the present temper of the Spanish nation, it is idle to suppose that the Apostolical party could have quietly retained possession of power, and whatever strengthened Carlos, like the success of Miguel, would only have made the contest more bloody and more protracted. Earl Grey, therefore, properly stated, that he could not contemplate the possibility of the Apostolical party being triumphant without a greater certainty of civil war in Spain. His Grace complained that we had not interfered against Mehmet Ali; saying, that we had only to send a fleet to the Mediterranean, and that our directions would be as readily obeyed by that Pacha as by one of our own Admirals. His Grace wished therefore to be a Dictator, not only at home, but over all the world. Is not this precisely that spirit and principle of which we now complain in Nicholas and of which we did complain in Bonaparte. Earl Grey properly said, "it was not the duty of the Government of the country to interfere in case of a war between the Sultan and his revolted vassal; that the government has remonstrated with the Viceroy, but that there had been nothing to justify us in making war on him;" and he stated that a fatal blow was given to the independence of Turkey by the Treaty of Adrianople, negotiated during the Duke of Wellington's ministry. On every point of his querulous complaints, the Duke was ably answered by Earl Grey, so as to leave nothing to be desired. With respect to the legality of the Corporation Commission, Earl Grey gave it to be understood that a similar Commission had been issued with the consent of the very person from whom the objection to the present Commission had proceeded. Earl Grey, we presume, alluded to Lord Eldon. The Noble Earl also stated, that he was desirous to put an end to the Coercion Law, but that circumstances did not permit it. The debate in the Lords had no other result than to show a disposition in the Duke of Wellington to find fault, without any adequate reason. The Address was agreed to.

In the Commons, after new writs had been moved for Leeds, Dungarvon, and Ayr, Mr. O'Connell began by announcing his intention to move for a return of all taxes repealed during five years, with a view, of course, to show that injustice has been done to Ireland. We hope a return will also accompany it of the sums expended on Ireland. The Hon. Member also gave various other notices, among them one for a bill to secure the liberty of the press.

Mr. Littleton is to bring that part of the King's Speech which relates to tithes, under the notice of the House on the 20th of February.

Bills are to be brought in to disfranchise Warwick, Stafford and Carrickfergus. The announcement by the Solicitor General of a bill to abolish imprisonment for debt was received with cheers. Various other motions were given by individual members, such as a notice to exclude Bishops from the House of Lords, by Mr. C. Rippon, and a motion to repeal the Septennial Act by Mr. Chichester; but his Majesty's Government was chary of announcements, and they all relate to important matters.

The Dissenters.—Lord Althorp stated it is the intention of Government to propose a bill for the regulation of Dissenters' marriages, and that the Government will be ready to remedy the other evils under which they labor.

The Corn Laws.—In answer to a question put by Mr. Handley, Lord Althorp stated that it was not the intention of his Majesty's Government to propose any alteration in the corn laws, and that if any person brought forward a proposition to alter them, the Government would not support it. We must add, lest misunderstanding should prevail on this point, that the Noble Lord said the Government collectively;

and we have good reason to believe that several individuals belonging to the Government will support such an alteration in those laws as will substitute a reasonable fixed duty for the present graduated scale of duties. Mr. Hume and Mr. Hunt severally gave notice of motions on this subject.

The Address in answer to the Speech was moved by Mr. S. Lefevre, who made a speech much superior to the ordinary run of speeches on such occasions, but being a country gentleman, he very naturally dwelt more on the poor laws and on the state of the agricultural interest than other things. Mr. Morrison seconded the motion, and in a speech that was still more able than that of Mr. Lefevre's, entered at great length into the state of our manufactures, which he shewed to be in a state of prosperity. We are also happy to state, on the Hon. Member's authority, that this prosperity has in general extended to the laborer. The Hon. Member also shewed that the sufferings of Ireland since the Union, of which Mr. Connell complains so much, had been shared in by this country, and that it was beyond the power of the legislature to control the empire of fashion.

Colonel Evans made some severe remarks on the subject of the assessed taxes, but the Hon. Member declined to move any amendment. He bore a very flattering testimony, derived from personal observation, to the moderation with which Don Pedro has exercised his power.

Mr. Hume moved two amendments; the first, seconded by Mr. Warburton, was to pledge the House to take into consideration the state of the Established Church as to its temporalities, on which the House divided, and Mr. Hume was supported by 39 Members; the second was to pledge the House to make reductions in the establishment, which the Hon. Member did not press to a division.

Lord Althorp, in reply to Mr. Hume, stated, that great reductions might be made without detriment to the public service, and it was the intention of the Government to propose a reduction of taxes. He announced that he is to bring in a measure on the repeal of tithes, which would be satisfactory to the House, and the country at large, and he hoped that the question would be settled this Session.

Mr. Robinson opposed the views of Mr. Morrison, and Mr. Grattan censured the part of the Speech which relates to Ireland.

Mr. O'Connell, after a more moderate speech than was expected from him, moved to leave out the three last paragraphs of the address.

Mr. Littleton made an able reply to the Hon. Member for Dublin, so as to make it unnecessary for any person connected with the Government to speak, declaring, however, that if something were not done as to tithes he should consider the case of Ireland desperate.

Sir R. Peel stated the qualifications with which he supported the Address, which related chiefly to our foreign policy. After some observations from Lord Palmerston and Mr. Baring the Address was unanimously agreed to, and the House adjourned at the reasonable hour of a quarter before midnight.

LONDON, FEB. 4.—We have received by express the Paris papers of Sunday, together with letters from Madrid of the 21st and 22d ult. The particulars of M. Dulung's funeral, which took place on Saturday, occupy a considerable space of most of the Paris papers. It appears that there were 30,000 men under arms, for the purpose of suppressing any movement which might have threatened an *emeute*.

On Monday, a smack brought into Dover, George Pile, the second mate, and three seamen, and four passengers belonging to the Seaton Castle, of Whitby, from Liverpool to New York, wrecked in the Western Ocean. They were taken off the wreck, where they had remained twenty eight days.—[Kentish Gaz.]

SUMMARY.

DEATH OF MR. NEWTON, the distinguished American Artist. The London Literary Gazette says—

"It is with regret that we have this morning received intelligence of the death of Mr. G. S. Newton, the Royal Academician, which took place on this day week, after a short but melancholy illness. Mr. Newton could not have reached his fortieth year; and, we lament to add, has left a widow and an infant child only a few months old. The grace, beauty, and feeling of his compositions are two well known to need our praise (which, indeed, they have often received in the highest terms); and we can only express our deep sorrow for his premature loss."

PLANTERS' BANK, MISSISSIPPI.—The rumor of the failure of this bank is undoubtedly erroneous. It is

known that it has, in a Philadelphia bank of responsibility, a cash balance at this moment of \$60,000.—Letters from Cincinnati, of the same date as that containing the report, are silent on the subject.

To the Editor of the New York American:

SIR: Our community is at this moment so engrossed in the great financial dispute, that the notice which, with your customary prompt attention to the fine arts, you inserted in the American, of Cole's picture, may have been overlooked, or forgotten. Every American should be proud to pay the tribute of his homage to this surpassing production of the genius of his countryman. We can imagine no surer mode of suspending (for a while at least) the carking cares of this world—of raising the mind above *deposits* and *discounts* and all mere temporary interests—than by a contemplation of the picture of the Angels appearing to the Shepherds, where the poetic painter has so powerfully illustrated the scene of the annunciation, that as you look on the beautiful scene you feel as if you were listening, with the Shepherds, to the good tidings of great joy which shall be to all people. We would earnestly recommend to mothers to avail themselves of this opportunity, to impress on their children through the medium of the eye (which, as the engravers say, cuts in) one of the most interesting scenes in the religious history of man.

Is the cross in the Star of Bethlehem an original idea of Mr. Cole? If so, he must have the credit of an exquisite conception of genius. L.

Fire at Harrisburg.—Quite a destructive fire took place at Harrisburg on Friday last. It broke out about nine o'clock, in Second street between Locust and Pine, in a frame building occupied by Mr. George Boyer as a dwelling house and tallow chandlery, and immediately communicated to the adjoining buildings, spreading destruction and panic on all sides, and before it was arrested totally consumed it together with the house owned and occupied by Mr. Lawrence Lewis, Assistant Door-keeper of the Senate; a house owned by Mrs. Baleley and occupied by Mrs. M'Elwee; a part of the house also owned and occupied by Mrs. Baleley; and a shop occupied by Mr. John Kuukle.—[Philadelphia Inquirer.]

GREAT FIRE AT SYRACUSE, MARCH, 16.—*Extract of a private Letter.*—I regret to inform you that we had an awful fire last evening in this place. It was discovered in a store of wood opposite Syracuse House, at 11 o'clock at night. It burned, with the rapidity of lightning, the entire block of stores from the main bridge in front of Syracuse House on both sides of the Canal to the next street East.

The loss exceeds \$100,000, upon which there is an insurance of near \$50,000. About 30 active, industrious Merchants, by this fire, have been cast out of their places of business, and the greater portion of their goods burned and destroyed.

An entire block was saved by the timely aid of an engine from Salina.—[Jour. of Com.]

THE BLIND.

You see those flowers, my lovely child,
Are they not beautiful and bright?
Is not your little bosom wild
With gladness at so fair a sight?
Look at your sister's rosy cheek,
And in your mother's beaming eye;
Has language any words to speak
The loveliness you there espy?
Behold that bird whose pinions float
In grace and gladness o'er the air,
The beauty of whose warbling note
Can scarcely with his plumage compare.
And mark, too, yonder beaming bow,
Reflecting all the hues of heaven;
Is there a happiness you know
Sweeter than this bright form has given?
Even night hangs out its lamps to thee,
Like diamonds round its ebony throne,
And bids you gaze in ecstasy
On worlds revealed to sight alone.
Know you, my child, that there are eyes
That never gazed upon a flower,
Ne'er saw the rainbow's lovely dyes,
Beaming upon the summer shower?
That ne'er beheld a sister dear,
Ne'er felt a mother's tender smile,
And knew no solace but to tear,
Their endless midnight to beguile?
Then go with me and hear the song
That swells to cheer these saddened ones,
The sparkling eyes of all our throng
Shall to their darkness be as Suns.

We have had for several days the the pamphlet referred to in the annexed paragraph from the Journal of Commerce, without finding time to read it. We therefore willingly avail ourselves of the article on the subject, from that paper.

NEW GRANADA AND FRANCE.—We have before us a pamphlet of 159 pages, published at Bogota, containing the official correspondence between the Government of New Granada and the Chargé d'Affaires of France, on the subject of the treatment of the French Consul (Barrot) at Carthagena, by the subaltern authorities of that place. Without attempting to decide on the very doubtful question about the privileges and immunities of Consuls, we have been struck with the spirit of forbearance and reconciliation which pervades the communications between the parties, as presenting a remarkable contrast to those of the Commander of the French squadron of Carthagena.

Whatever the errors of the authorities of Carthagena may have been, it appears evident from the aforesaid communications, that the Government of New Granada have done every thing in their power to put an honorable termination to the difficulties which have arisen from the Consul's treatment. An official note of the 9th January, from the Granadian Government to the Chargé d'Affaires of France, offers such reparations, as it seems to us, should be fully satisfactory in a case like this, in which the privileges and immunities claimed, are not explicitly agreed on, nor implicitly admitted by the respective Governments. On reading the communication, one would have anticipated the acceptance of the terms offered, and a termination of the unpleasant affair. These terms were, 1st. The punishment of any person or persons who should prove to have acted improperly towards the Consul. 2d. The removal from office of Col. Vega, Governor of Carthagena at the time: 3d. The installation of a Vice Consular office at Carthagena, hoisting the French flag on the Consular house, accompanied by salutes from the Artillery; and, 4thly. Indemnity for the losses incurred by the Consul according to a fair valuation of the property.

The Chargé d'Affaires, for reasons we do not know, did not accept these reparations, and the Granadian Government has hastened to send a diplomatic Mission to the French Court, to have the difficulties settled. The person chosen for this object is Colonel J. M. Gomez, well known in this country as Secretary for many years of the 1st Colomb. Legation sent to this country at the head of which was the Hon. J. M. Salazar, Minister Plenipotentiary. Col. Gomez was afterwards sent as Chargé d'Affaires to the Court of Rio Janeiro, and after having concluded a treaty with the Brazilian Government, returned to his country, where he has been employed in responsible and useful services under the Government, and was Treasurer in the important province of Antioquia, when the occurrences with the French Consul induced the Government to charge him with this mission to the King of the French. We hope that through the tact and abilities of Colonel Gomez, the difficulties will be settled, both parties be righted, and that harmony and good understanding re-established which are so vital to the interests of both countries.—[Jour. of Com.]

United States Ship Fairfield.—It appears from a statement in the Norfolk Beacon, that on the night of November 25th, when President Flores recaptured Guayaquil from Gen. Rocafuerte, a boat was sent on shore from the United States Ship Fairfield, then in the harbor, to ascertain the cause of the firing.

About 11 o'clock the boat returned, having been fired into by the troops of Flores; two of the boat's crew were wounded; one of them, *Henry Young*, had six balls in him, two of which were in his head; he died about half an hour after getting on board; the other man, *Wm. Gunnerson*, had two balls through his body, and his left arm broken; he was recovering. The Fairfield was at Payta 13th Dec. to sail in ten days for Callao, and thence in a few days for Valparaiso.—All well.

Caution to Whalers.—We have been favored with an extract of a letter from Captain W. Barney, Jr. of ship Barclay of this port, now in the Pacific Ocean, dated Oct. 10, 1833, containing the substance of an important communication to him from Captain Long, of the U. S. schr. Dolphin, lying at that time in the port of Callao.

Capt. L. furnishes the translation of a decree issued by the President of Lima, and Heads of Departments of the Peruvian Government, prohibiting all foreign vessels from whaling or sealing in the bays

along the coast, or on any of the islands of the Republic, without license previously obtained; under penalty of seizure and detention in any port of the Republic, without redress, or recovery of damages for being so seized and detained.

This is a regulation of serious moment to those concerned in the fisheries on that coast: and, without due precaution, may be the occasion of much dispute.—[Nantucket Inquirer.]

Fatal accident.—Four lives lost.—On Tuesday, the 4th inst., six men were engaged in navigating a flat boat, laden with stone coal, down the Youghiogheny river, in this state. On approaching the Little Falls, in Fayette county, it was discovered that the boat was not in middle of the chute, which is very rapid. Their fate seemed as inevitable as it was appalling. Consternation and dismay overwhelmed the party. One or two abandoned the boat, and made for the shore. The others remained in mute despair, and were carried over the falls with the boat, which turned sidewise in its passage, and was sunk with its contents. Four were drowned, and two got to shore with great difficulty. Their names we cannot give.—[Philadelphia Inquirer.]

[From the Troy Free Press.]

FACTS FOR FARMERS.—From a table of prices current, for the city of Troy, it will be seen what effect the experiment now making by our rulers upon the currency of the country, has had upon the produce of the farmer.

WHEAT, which last fall sold at \$1 12 to \$1 15, is now dull at 92 to 96 cents.

RYE then sold at 75 to 80 cents, now it is reduced to 50.

CORN, (yellow) which then sold at 75 cents, now sells at 50 to 56.

CORN (white) then sold at 81 cts, now at 56 to 62.

There is also, it will be seen, considerable reduction in the price of Flour, and which is dull even at reduced prices.

MEAT PORK, which then sold for \$15 per bbl. is now reduced to \$13 and \$12 50.

PRIME PORK has fallen from \$12 per bbl. to \$10 and \$9 50.

This unusual fall in the prices of the products of the farmer, is the more worthy of attention, and affords an alarming symptom of the diseased state of trade and business—since it occurs at a season of the year—the opening of the river, and of the spring trade—when always, heretofore, prices have experienced material improvement, rather than depression.

On Thursday last, (says the Georgia Enquirer of the 1st inst.) the companies of Artillery lately from Old Point Comfort, who have been stationed for some time at Fort Mitchell, took their leave, in the steamer Sangamon; and on yesterday several companies of Infantry passed through this place, from the same station, on their way to Tennessee.

[From the Edinburgh Observer.]

SIR WALTER SCOTT AND THE ROXBURGHE CLUB.

Early in 1823, in consequence of a vacancy in the Roxburghe Club, occasioned by the death of one of its members, it was proposed by Earl Spencer, the President, at the annual meeting to elect the "Unknown Author of Waverley," and the Secretary, Dr. Dibdin, was requested to address Sir Walter Scott on the subject. The two following letters were in consequence received by Dr. Dibdin, from Sir Walter Scott. The worthy and estimable Baronet met the Club but once, at their anniversary in May, 1825.

"MY DEAR SIR,—I was duly favored with your letter, which proves one point against the unknown author of Waverley; namely, that he is certainly a Scotsman, since no other nation pretends to the advantage of second sight. Be he who or where he may, he must certainly feel the very high honor which has selected him *nominis umbra*, to a situation so worthy of envy.

"As his personal appearance in the fraternity is not like to be a speedy event, one may presume he may be desirous of offering some test of his gratitude in the shape of a reprint, or such-like kickshaw, and for this purpose you had better send him the statutes of your learned body, which I will engage to send him in safety.

"It will follow as a characteristic circumstance, that the table of the Roxburghe, like that of King Arthur, will have a vacant chair, like that of Banquo at Macbeth's banquet. But if this author, who hath 'fern-seed and walketh invisible,' should not appear to claim it before I come to London (should I ever be there again) with permission of the Club, I, who have something of adventure in me, although a Knight like Sir Andrew Aguecheek, dubbed with unpacked

rapier, and on carpet consideration, would, rather than lose the chance of a dinner with the Roxburghe Club, take upon me the adventure of the *siege perilleux*, and reap some amends for perils and scandals into which the invisible champion has drawn me, by being his *locum tenens* on so distinguished an occasion.

"It will be not uninteresting to you to know, that a fraternity is about to be established here, something on the plan of the Roxburghe Club; but, having Scottish antiquities chiefly in view, it is to be called the Bannatyne Club, from the celebrated Antiquary, George Bannatyne, who compiled by far the greatest records of old Scottish poetry. The first meeting is to be held on Thursday, when the health of the Roxburghe Club will be drunk.

"I am always, my dear sir, your most faithful humble servant,

WALTER SCOTT.

Edinburgh, Feb. 25, 1823.

"My dear Sir—I am duly honored with your very interesting and flattering communication. Our Highlanders have a proverbial saying, founded on the traditional renown of Fingal's dog, "If it is not Bran," they say, "it is Bran's brother." Now this is always taken as a compliment of the first class, whether applied to an actual cur, or parabolically to a biped; and upon the same principles, it is with no small pride and gratification that the Roxburghe Club have been so very flatteringly disposed to accept me as a *locum tenens* for the unknown author whom they have made the child of their adoption. As sponsor, I will play my part as well as I can; and should the real Simon Pure make his appearance to push me from my stool, why I shall have at least the satisfaction of having enjoyed it.

"They cannot say but what I had the crown."
